"Heightened competition," Corzine observed, "will put a premium on cutting-edge technology, up-to-the-moment intelligence on global market opportunities, the development of innovative products and services, and a redoubled dedication to the customer. Competition will also require a renewed emphasis on risk management and financial soundness if firms are to survive the inevitable cyclical downturns, like the one from which the industry is even now emerging.[3] Striking the right balance between entrepreneurial initiative and financial prudence will be the fundamental test of success."[4]

The competitors were changing and the industry was changing—becoming more global, requiring major capital commitments for trading and information technology, increasing financial risk—and the business of the firm and its earnings were changing from agency-advisory investment banking to capital-at-risk proprietary trading and dealing. By many steps and stages, one partner after another moved from opposing to favoring an IPO. Fifty years before, the firm had had only one partner in the bond business; when an IPO came to a vote in 1998, there were fifty-three partners in Fixed Income and they voted 51 to 2 in favor of an IPO. Immersed in a trading culture, living in a mark-to-market world where everything was for sale, they had learned to be realists and were less enamored of traditions.

Good as 1996 had been in the firm's business, 1997 was even better. Goldman Sachs played key roles in Deutsche Telekom's gigantic $13 billion privatization, the privatization of China Telecom—that nation's first—and the largest industrial merger up to that time, and the $38 billion combination of Chrysler into Daimler-Benz. Profits exceeded $3 billion, taking return on equity capital up over 50 percent—well above the industry's 36 percent average.

As usual, Corzine was deeply and personally engaged in the global markets at any time of the day or night, checking the major markets every morning: a 6:15 call to Lloyd Blankfein in New York, a 6:30 call to Pat Ward in London, and at 6:45, a series of calls to offices in Asia. In addition, if needed for an important decision, Corzine gladly took calls at 2:30 a.m., again at 3:00 a.m., and again at 4:15 a.m. Naturally, more and more of the calls from those who needed a decision went to Corzine, increasing his operational expertise and his leadership strength within Goldman Sachs.

Not all the calls came from people trading in the markets. In 1996, Corzine got an angry message from Christopher Gent, the CEO of Vodaphone, a major client in the United Kingdom. Their business relationship could be terminated because the firm had underwritten a $1.2 billion IPO of Orange, a competitor, without first conferring with Vodaphone. Corzine quickly called Gent to apologize and, as Gent later recalled with characteristic understatement, "We came to an understanding early on of what was expected of them. I expected them to commit to us."[5]

While a partnership is a legal structure, the effectiveness of any partnership depends on informal bonds between partners. As partnerships get larger and larger, the person-to-person connectedness declines and the dynamic of the group changes. Intimacy fades into mere acquaintance; communication losses clarity, subtlety, and effectiveness; and personal warmth and affection decline. While the legal structure of partnership continues, the personal connections dissipate. Into all those spaces can slip tensions, misunderstandings, hurt feelings, and disagreements. Corzine believed he would outlast all the others; he compared himself to Sandy Weill of Citigroup and was determined to be the recognized king of Wall Street. "It's not that he always *thinks* he's right; it's that he *knows* he's right," said Bob Hurst. "That's dangerous."

As Corzine settled into his position as senior partner, the consensus jelled within the firm that he would be there for a long time. Partners agreed: *Jon Corzine will be picking his team for the next decade during the next few months*. Corzine would have good reason for thinking he was in a strong position. Profits had increased substantially; he had secured another major equity investment

from the Bishop Estate; and increasing numbers of partners were recognizing the strategic importance of having permanent capital plus stock to use as currency in acquisitions and to reward strong contributors without having to offer a full partnership. With higher earnings from the rising importance of GSAM and strong trading profits—and the higher price-earnings multiples accorded competitors, the compelling power of great personal wealth was pulling increasing numbers of partners to support an IPO. And the objective case for an IPO was gaining power.

Corzine was increasingly popular within the partnership. But within the executive committee, important changes were coalescing toward confrontation.

"Jon thinks *big*," recalls Bob Hurst. "He had decided that Goldman Sachs was not big enough."

Declaring "I'm an expansionist!" Corzine wanted to do a string of small "shock absorber" acquisitions in investment management and initiated talks with several firms, including Robeco, Wellington, and Grantham Mayo Van Otterloo. Anticipating the inevitable collapse of Glass-Steagall, which had separated commercial and investment banking since the Depression, Corzine initiated talks with the CEO of J.P. Morgan, the CEO of Chase Manhattan, the CEO of U.S. Trust, and the CEO of Mellon Bank.[6] Having initiated a conversation about getting together with a major bank, Corzine would sometimes "adjust reality" and tell his partners that the initiative had actually come from the other party. Seeing himself as CEO, Corzine considered these strategic initiatives appropriate to his position and the powers he wanted, but his partners—particularly those on the executive committee—strongly disagreed. As they saw it, *they* were the ultimate power in Goldman Sachs because they represented the partnership, and within the committee they were all "one man, one vote" equals.

Corzine was off the ranch, as others saw it, going around to firm after firm and bank after bank to "get acquainted" and raising questions with several about possible working relationships or even mergers. His independent strategic initiatives paired in the minds of others with his informal, ad hoc way of making operational decisions. Corzine was often intuitive and seemed to others improvisational and undisciplined, while Paulson was all about careful plans and always had everything worked out in advance. "Corzine kept making seat-of-the-pants

decisions and improvisations," recalls Bob Steel. "He was not buttoned up and had way too many things on his to-do list—way too many to get them all done."

Corzine's discussion with Mellon Bank provoked an especially negative reaction within the executive committee. When he came back from a weekend of unannounced talks with Mellon CEO Frank Cohuet, a partner said he was astonished that Corzine would do such a thing—partly because he didn't have the authority and partly because he was proving how naive he was about the dance of M&A. Thornton recalls saying, "As CEO, you should *never* initiate such a discussion. That's simply very bad tactics. Instead, you should carefully create a set of conditions so the other guy comes to *you*—and comes as a supplicant. The *last* thing a skillful CEO would ever do is go out courting a refusal all alone.[7] You are too inexperienced and you don't know how to play the role of a CEO in doing a merger deal. You have to be disciplined and self-aware. You don't know the rules. And, Jon, you're *not* a CEO; this is a partnership. You are our senior partner, Jon, but you're not our CEO. The management committee—all the way back to Gus Levy—is the responsible party in this firm's partnership. You can't go off on your own doing deals or raising possibilities of merger with others. Besides, you really don't have enough experience in M&A to know how to manager high-level exploratory talks about getting together."

John Weinberg warned Corzine to stay away from a merger with Chase. "Corzine was looking at merging with Chase Manhattan and I told him: 'If you join [CEO] Billy Harrison, he'll tell you he has to retire in a year because he has prostate cancer and will indicate that you can look to become CEO after he's gone in a year or so. But you'll be only one of five guys with the same come-on promise, and the other guys will all know all about commercial banking—about which you know *nothing*. Since that's the core business and since you don't know that business, they'll kill you. Besides, with a big outfit like that, they'll move lots of Goldman Sachs guys into various positions and milk the best of Goldman Sachs away, and then dilute the rest. You'll have no base of support. Commercial banking will be the combined organization's biggest business, so the next CEO will have to be chosen from those who know the main business—commercial banking—and it won't be you!' "

The balance between building the best firm and making the most money had changed a lot," explains a senior partner. "Twenty or thirty years ago, we all

knew that if we built a great firm, the profits were sure to follow. We *knew* that if we were the best firm with the best people, we couldn't miss making big profits. But with a public firm requiring quarterly earnings reports, the focus could shift."

Silfen leaned toward an IPO as a way of adding flexibility to compensation arrangements. "Reward the very best very well," he says, "but you need to find the balance that also holds the very good *and* motivates and rewards the very, very best, who are the decisive value-adders on crucial business transactions or the development of significant new ways of doing business. That's why I was one of those who favored going public—so we'd have the currency of a public stock and a way to tie everybody together with a common interest."

Much as he loved the firm, Silfen knew that being co-head of a major division and a member of the management committee was as far as he could go or wanted to go. He had made more money than he had ever dreamed of, and at fifty he still had ample time to do whatever he wanted in a second career. As a realist who understood markets, he felt comfortably objective about his career decision: It was time to go.

Silfen went to Corzine and laid it out quietly and clearly. The two men had never been particularly close. They had not worked closely together—one was in Equities and one in Fixed Income—and their personal styles were dissimilar. Silfen was careful, focused, and exact while Corzine was open, comfortable with ambivalence, and a risk-taker. Silfen may have had some hopes that Corzine would ask him to stay and perhaps even offer him a special incentive to do so, but Corzine didn't rise to the opportunity. He simply said he understood. "You've had a great run, David. It's your decision to make, of course. Not a problem." Silfen's parting would have little immediate significance to Corzine, but it would lead almost inevitably to Corzine's being forced out as managing partner of Goldman Sachs.

The initial public offering would position Goldman Sachs as an industry leader and make the partners rich, and the members of the executive committee very rich. The irony would be that the stresses generated by Corzine's unrelenting drive to complete the IPO were a significant factor in his approaching downfall. As Corzine said later, "It would've been a lot easier not to get into the fight about going public. I could've just stuck it out another fifteen years and accumulated a much bigger net worth."

32

LONG-TERM CAPITAL MANAGEMENT

Excepting that annus horribilis of 1994, 1998 was as bad as it gets. Goldman Sachs lost hundreds of millions of dollars in proprietary trading and very nearly lost hundreds of millions more in a major hedge fund's collapse. It simultaneously missed—by minutes and a few key words—an opportunity to pull off a moneymaking coup that could have *made* hundreds of millions. As a result, as the stock market declined, Goldman Sachs had to postpone indefinitely its on-again, off-again plans for an IPO, on which Jon Corzine had expended much of his personal political capital. This would hurt his credibility as the firm's leader.

In a longer-term context, 1998 was a time of significant change in the partners' consensus view of Goldman Sachs. The year's events would be seen as forceful evidence of the importance of securing permanent capital by going public. It also showed the increasing importance within Goldman Sachs of proprietary trading, which was on its way to taking precedence over what had been the firm's long-standing, nearly sacrosanct strategic priority: earning trust and recognition among corporate clients as the premier service and relationship investment banker. With its accelerating drive into trading, Goldman Sachs was reinventing

itself as a major market-making, risk-taking financial intermediary—the revolutionary shift away from service-based *agent* to capital-based *principal* and toward becoming one of the most powerful financial forces in the world.

Goldman Sachs was becoming the quintessential capitalist organization, making aggressive capital investments and using highly sophisticated computer models to embrace and manage all sorts of risks—many previously unknown—to extract risk-controlled trading profits from capital markets around the world. The firm would profit from its creativity, its access to information, and its ability to organize transactions. Deference to clients and a strong commitment to nurturing relationships, valued as important strengths, would be balanced by and even outweighed by bold use of capital. They would be recognized as potential impediments and possible signs of weakness. One of the first major manifestations of the firm's emerging strategy was seen in its way of dealing with the threatened collapse of a giant, high-tech hedge fund called LTCM.

LTCM—Long-Term Capital Management—appeared to have discovered or invented a wonderful new way to manage a massive hedge fund with a low-risk, high-return portfolio. Only certified financial rocket scientists could really understand the details of how it worked, but everybody knew that LTCM—a mysterious, glorious, golden money spinner—produced spectacular results. The fund was launched in 1993 by John W. Meriwether, known to admirers as J.M., the quietly charismatic leader of Salomon Brothers' justly fabled and notoriously profitable proprietary trading unit. At LTCM, fewer than two hundred people, including two Nobel laureates and a host of brilliant Wall Streeters, managed a huge, private, and very secretive model-driven hedge fund for a partnership of fewer than one hundred large investors. In an era of financial creativity, it was truly outstanding. Four aspects of LTCM were large: the assets, the leverage, the egos of the principals, and the profits.

LTCM's portfolio appeared to be extraordinarily diversified because it was constructed of thousands of diverse, small, "perfect arbitrage" paired positions selected with the aid of advanced computer programs that identified thousands of anomalies, or market imperfections, in bond markets around the world. LTCM selected the most attractive opportunities for profit and constructed a portfolio designed to squeeze out or neutralize every identifiable specific risk and pile up the profits. While LTCM's individual positions were far larger than other

investors', relative to its enormous total size they seemed small, and the profit on each paired position seemed very small. The overall strategy was to vacuum up nickels, dimes, and quarters all around the world in such repetitive, wholesale volume and with such great leverage that cumulative portfolio profits would be huge and almost actuarially certain.

The LTCM strategy worked beautifully for a time. LTCM was demonstrating extraordinary success, compounding profits at over 40 percent a year. The fund's disciplined moneymaking machine relied on two interdependent systems. One was the brilliantly designed computer system for scouring the markets of the world to find an extraordinary number and variety of attractive component parts for its portfolio of thousands of paired positions. The other was a secretive and complex system of borrowing from banks and broker-dealers around the world. LTCM used such enormous leverage that while its investors' *equity* was $3 billion, its *portfolio* totaled a gargantuan $100 billion. Beyond that, it had derivatives contracts with virtually every Wall Street bank and dealer, for a total market exposure of more than $1 trillion! The secret to this extraordinary leverage was the lenders' confidence that LTCM's portfolio was shrewdly diversified against *all* risks.

But unknown to both LTCM and its lenders, there was one risk against which it was not diversified: the risk that somehow all the many different markets around the world would all react the same way to a specific, important, very unlikely, and very distressing event—such as a sudden devaluation of the Russian ruble.

At LTCM, instead of the usual hedge fund fee of 1 percent of assets plus 20 percent of profits, the fund's management got a 2 percent fee and 25 percent of the profits. LTCM investors didn't really care that the fees were so high because they too were doing very, very well. After a 28 percent gain in its first year, LTCM produced a spectacular 58 percent gain in 1994. (Actually, given the huge payments to the general partners for managing the fund so successfully, the net gain to limited-partner investors was "only" 20 percent in 1993 and "only" 43 percent in 1994.) By the end of 1995, with annual "2 and 25" payouts accumulating—which they kept investing in LTCM—the general partners running LTCM had amassed $1.4 billion in their personal accounts in the fund. The general partners' position was up nearly ten times from their initial investment of $150 million in just two years. And more good news was coming.

In 1996, LTCM gained an astonishing $1.6 *billion*—57 percent, or 41 percent net to investors after paying the general partners. If $1.6 billion sounds very big, there was an even more significant number that sounds very *small:* The real return on the total portfolio in LTCM's great year was actually only 2.45 percent. As we shall see, the crucial factor in the giant gains to investors—and to LTCM's general partners—was leverage, *lots* of leverage.*

In addition to those two divergent numbers—$1.6 billion and 2.45 percent—another annual number mattered greatly. LTCM's large-scale and hyperintensive portfolio turnover generated a huge volume of business for Wall Street. Paying fees, spreads, and commissions that totaled well in excess of $100 million annually made LTCM one of the world's largest customers for the securities industry. While investors wanted to get in on the LTCM gravy train, their enthusiasm seemed almost restrained compared to the intensity with which the world's major banks and dealers scrambled to be helpful to LTCM. They all wanted more of that rich annual flow of $100 million. Goldman Sachs was not only one of the major dealers, but Corzine's "prop" (proprietary) desk was making similar, even identical "arb" trades, so it was also a competitor.

Not only was LTCM designed brilliantly, but it was operating supremely well too. LTCM was a spectacular multiple success: success for investors, success for banks and brokers, and success for LTCM's managing partners. Incredibly, however, spectacular success was becoming a problem, a large problem: LTCM had too much money to manage. Compared to the market's liquidity and trading volume, the partners decided LTCM had become *too* big. By 1997, investors' equity capital in LTCM was $5 billion. And it kept rising. At $7 billion in 1998, LTCM had more equity capital than Merrill Lynch, Wall Street's largest firm. Size was a problem because LTCM's buying or selling was moving prices and shrinking the profit opportunity in each market imperfection.

So LTCM did something unusual for a hedge fund or any other type of investment manager: It obliged investors to take back $2.7 billion of their invested capital. And LTCM's general partners did something else that was unusual: While returning so much capital to outside investors, they deliberately did *not* reduce the size of LTCM's portfolio. Instead, the general partners chose to borrow more and

* Roger Lowenstein's wonderful study *When Genius Failed* (New York: Random House, 2000) provided much of the detail used in this chapter.

increase the leverage so they and their investors could make even more money on their equity capital. LTCM's general partners were already rich, but now, with the increased leverage, they would be on their way to being superrich, making *really* big money. And this they did . . . but only for a few months.

A further problem was that LTCM was clearly not alone—the fund had too many imitators. Astute traders at the prop desks at major investment banks and at the big hedge funds had studied together at the same business schools, trained together at the same Wall Street firms, and used the same sort of quantitative models and computer programs. They were out looking for the same trades, and talked with each other all the time, comparing notes and sharing insights and facts. Enjoying their rivalries in discovering new things, they were more than glad to steal or copy each other's ideas—including the best ideas of LTCM. LTCM was the biggest and arguably the best, but many, many other smart quant traders were putting together the same perfect arbitrage pairs for the same reasons. And more and more bond-arbitrage funds were being formed to exploit the small niche anomalies in which LTCM specialized. It could never be proved, but many on Wall Street believed that the dealer most actively engaged in trading against LTCM was Goldman Sachs.

The markets in which LTCM operated were about to change dramatically and prove once again that leverage cuts both ways—sometimes suddenly. In June 1998, LTCM had a bad month: It lost $500 million. But investors knew "things happen," and Meriwether was candid and specific about the loss and the reasons for it. Overall: not a problem—yet.

Then, in August, Russia abruptly defaulted on its debt, and that changed everything.

In a massive flight to quality and liquidity, frightened investors everywhere scrambled to sell out of unusual and illiquid securities—exactly the securities LTCM was holding—and buy into the higher-grade, more liquid securities that LTCM had sold short in its perfect arbitrage paired positions. Getting hit both ways—longs being sold *down* and shorts being bought *up*—was obviously bad for LTCM. Now Meriwether was not entirely forthcoming: Performance disclosure was selective—and performance was far worse than most LTCM investors

realized. Goldman Sachs realized it, though, because its own proprietary trading gave it unusual access to crucial market information.

Longer-term rational market behavior was being pushed aside, and the unexpected, unpredictable, and often irrational short-term market was being driven by anxious investors, dealers, and hedge funds fleeing to quality and liquidity. The spreads between LTCM's carefully matched long-short pairs were not closing as LTCM's models said they should; they were opening up wider and wider. Suddenly, LTCM was not making profits; instead, it was losing on thousands of pairs. And every time LTCM traders wanted to unwind a paired position, so too did many like-minded hedge funds and dealers.

Market liquidity depends on differences of opinion among many different buyers and many different sellers: the more differences, the better for liquidity. When investors agree, whether rationally or emotionally, on what is the "right" market direction, liquidity quickly evaporates. Strong agreement on market direction, particularly strong emotional agreement, can produce a stampede that quickly destroys liquidity. LTCM's computer models made no provisions for changes in market liquidity—particularly a sudden and unexpected evaporation of liquidity.

Volatility, or market risk, is roughly the opposite of what the most active investors and traders usually mean by "quality." Most investors dislike price volatility, so they would prefer to offload it. They can—for a price—and others will, for a price, accept or "buy" volatility. Volatility cannot be bought or sold directly. But volatility can be bought or sold *indirectly* by selling short or buying stock-index futures or, to get even greater leverage, buying or selling options on stock-index futures. Volatility is usually mispriced because, since most investors dislike market risk, they are quite willing to sell volatility at less than its mathematical fair value, because they are effectively buying insurance against market risk. Futures and options on futures will usually move away from their normal trading range when investors collectively either fear a market decline or hope for a rise. The more pervasive the hope or fear, the greater the distance from normal pricing for market volatility—which traders call "vol." LTCM could therefore effectively buy or sell vol by trading in stock-index futures, and this became a major part of its portfolio operations.

As investors, reacting to the surprising Russian default, scrambled out of

the unusual, illiquid securities that LTCM specialized in, they sold what LTCM owned long and bought what LTCM had sold short. That drove market prices further and further away from the normal price correlations that LTCM's computer models had used to identify the anomalies that LTCM had been so successfully exploiting in its highly leveraged portfolio. Suddenly, everything was different. Now the market was going strongly against LTCM, and while its portfolio was wonderfully diversified in many, many ways, it had *no* diversification against the one risk of a worldwide, simultaneous flight to quality, with investors shunning more speculative securities—and that flight to quality was becoming a stampede and trampling LTCM.

Corzine knew that the traders at Goldman Sachs had large exposures to the same kind of complex, derivatives-based portfolio positions that Meriwether and his crew at LTCM had been establishing in recent weeks. Corzine also knew—because Goldman Sachs was believed to watch LTCM closely and allegedly often matched LTCM's trades in the firm's own proprietary portfolio—that the "spread" trades LTCM always liked to do had been going very much in the wrong direction. Corzine knew too about LTCM's large leverage. Bold investors might borrow half the money they invest, so they would have 50 percent leverage and 50 percent equity. Hedge funds often borrow more, reaching as much as 80 percent or, very temporarily, even 90 percent leverage. But at LTCM, Meriwether and his group were borrowing much more: The equity wasn't 50 percent or even 10 percent; it was a mere 3 percent. LTCM was using leverage with a vengeance. With 3 percent equity, a loss of just 3 percent in its total portfolio would completely wipe out LTCM.

Phenomenally secretive, LTCM had irritated Wall Street in its first few years of operation by refusing to inform its investors or its lenders about *any* of its internal operations. In a world that increasingly insisted on transparency, LTCM arrogantly insisted on being opaque. So when Meriwether had a "serious markdown" and felt obliged to step outside his closely guarded realm of secrecy to call one of his major dealers and financial backers at home early in the morning, Corzine knew that the situation was serious, no matter what verbal assurances J.M. was giving.

If he'd known at the outset that Meriwether was calling from Beijing, where he had excused himself from a dinner party to make the call and had just booked

himself on the next flight home, Corzine would have known that the situation at LTCM was *very* serious.

As the worldwide flight to quality gained momentum and spread to more and more markets, arbitrage traders, who worked in the same market "space" as LTCM, got increasingly aggressive at cutting back their positions, particularly those positions that traders knew were similar to LTCM's and so wanted to get out of *first*. Some were acting on their senior managements' orders to cut back, and some had to reduce their positions because they were receiving margin calls from *their* banks. Suddenly, all the sophisticated traders wanted to sell. None wanted to buy. And they were selling their better-quality, more liquid positions, not because they wanted to—they didn't—but for one decisive reason: They *had* to sell the quality stuff to raise cash because nothing else *could* be sold into that suddenly anxious market.

In a normal, rational market, LTCM's highly diversified, carefully hedged positions *would* have been smart bets against a series of temporary pricing anomalies. In a normal, rational market, LTCM would have gone right on making millions by vacuuming up all those nickels and dimes. But LTCM's portfolio had two eventually critical problems. In every long-short pairing, LTCM always owned the lower-quality securities and was short the higher-quality securities. And most of its pairings involved complex trades in small, unusual markets where liquidity was always limited and could, as was now being proved, be *very* limited. Against the one specific risk of investors everywhere driving their portfolios toward higher quality and going against LTCM's clever positions, there was no hedge and no useful diversification. Instead of superb diversification in LTCM's portfolio, suddenly everything was strongly correlated.

Suddenly there was virtually no liquidity for the unusual, lower-grade securities LTCM owned most. Of course, given sufficient time, the market and its prices would eventually and inevitably become rational, but as John Maynard Keynes had warned long ago, "Markets can remain irrational longer than you can remain solvent." When they really *need* to sell, sellers don't choose the price, buyers do. A buyers' market was exactly what LTCM did not want.

When things go badly, the smart borrower doesn't wait for the lender to call. The smart borrower always makes the first call. So John Meriwether called his major banker: Jon Corzine at Goldman Sachs.

"We've had a serious markdown . . . but everything is fine with us." The words were reassuring. So was the tone of voice. But they always were when the very calm, understated, and self-contained and private caller was John Meriwether. J.M. was *always* calm and *always* understated, so his calmness this particular morning meant absolutely nothing. Corzine had enough experience and ample reason to know better than to feel reassured by Meriwether's call. First, the early morning call was not to his office; it was to his home. Second, it was starkly out of character for the secretive Meriwether to say *anything* about LTCM's portfolio, particularly anything as blatantly negative as "We've had a serious markdown."

As a long-experienced bond dealer who had made a career of buying billions of dollars of bonds that other people didn't want, Corzine was sensitive to signals, particularly any unusual or unexpected signal, and Meriwether was sending a soft, subtle, but very unusual, very unexpected—and therefore clearly significant—signal.

Corzine and Meriwether were contemporaries, knew each other well, had great respect for each other as major dealers, and understood markets and dealing in similar ways. They held similar beliefs about the changing nature of the world's capital markets and the increasingly attractive opportunities for highly profitable principal, proprietary investments, particularly in fixed-income arbitrage operations. Both men were unpretentious Midwesterners and comfortable within themselves—and both men were determined to win on a giant scale.

Corzine called Meriwether back because he wanted to know more—a lot more. He matched Meriwether's calmness with his own. Instead of saying, "J.M., you've been way too secretive. I know you're in a major jam. So you've got to come completely clean with us now or we'll cut your credit lines way back," Corzine simply cautioned: "We aren't getting adequate feedback. It could hurt your credit standing."

Corzine and Meriwether both knew the essential reality of the situation: LTCM was no longer in control. It would have to change its ways. Arrogant secrecy was over, a thing of the past. Now LTCM would have to share important information with its creditors, and that meant the creditors would learn things their traders could use to trade against LTCM, inevitably making the problem, however serious it proved to be, that much worse.

Given its extraordinarily high leverage, the adversities facing LTCM had developed rapidly. Calm as he seemed, Meriwether was quickly and quietly

exploring extraordinary moves, searching for the best way to go. Possibilities ranged from raising a huge capital infusion from investors to selling LTCM to a "white knight."

Early Monday morning, Warren Buffett of Berkshire Hathaway turned down an invitation to take over LTCM's entire portfolio. Later that same day, George Soros agreed to invest $500 million in LTCM at the end of August *if* Meriwether could raise another $500 million from other sources in those two weeks. Meriwether's negotiation with Soros was a dance of opposites. Meriwether was casual, Midwestern, and pragmatic while Soros, an Eastern European, was formal and conceptual. Meriwether's investing was rational and based on precise, predictive mathematical models, while Soros saw markets as organic, "reflexive," and unpredictable. Still, Soros and Meriwether had one thing in common: Soros's funds had just lost $2 billion in Russia.

J.P. Morgan & Company was ready to invest $200 million, and some bankers thought Merrill Lynch *might* come in with $300 million. But on Wednesday, Merrill Lynch called to say no. Because of the need for a swift decision, LTCM went back to Buffett, offering to cut its management fee in half if he would make a major investment in the fund. Again, Buffett said no.

The tension of the situation can best be appreciated if the reader assumes he or she was one of the LTCM general partners who had been experiencing this series of extraordinary moments:

- On the same Thursday that Buffett said no, LTCM lost $277 million. Only one prior day had ever been worse.
- Banks to which LTCM owed $167 million demanded repayment, saying the fund's poor results were a "default event." But the management company could not meet the demand; it had no ready money. And, as "insiders," the partners certainly couldn't make withdrawals—even to pay off their personal loans—when results were poor and they were asking others to increase their investments.
- Rumors flew through Wall Street that Goldman Sachs traders were selling what LTCM held in its highly leveraged positions. So were other dealers.
- During tough, sometimes confrontational negotiations with its crucial clearing broker, Bear Stearns, LTCM had refused, as a negotiating tactic,

to sign a formal clearing agreement. So LTCM had never gotten a signed guarantee from Bear Stearns to clear its trades. This meant Bear Stearns was free to stop clearing at any time—and if and when Bear Stearns quit, nobody would rush in to take over LTCM's complex clearing business.

LTCM partners were able—just barely—to persuade another commercial bank to take over a nearly $50 million bank loan that had just been called. Far more significantly, the partners, as individuals, had borrowed $38 million against their own investments in the fund so they could pay large year-end staff bonuses. Mechanically clever and technically legal, borrowing from already leveraged accounts was highly unusual and clearly whispered that the LTCM partners were skating into a very gray zone. Rumor on the Street was that the partners were feeling trapped. If the management company went into default, trading counterparties could claim immediate payment in cash. And if several counterparties tried to settle quickly, they would precipitate a ruinous run on LTCM.

Meriwether, twice cautious after having been burned a few years before for not informing the Federal Reserve Bank about Salomon Brothers' embarrassing involvement in a Treasury bond scandal, called New York Federal Reserve president William McDonough to advise him that LTCM would need more money.

Corzine got another call from Meriwether on Friday, the 11th—in Vienna, Austria, where Corzine was on vacation. LTCM's "assets in the box" had dropped below the $500 million minimum Bear Stearns required to continue clearing LTCM's transactions, so Bear Stearns had called LTCM: Its inspection team was coming to examine LTCM's books—on Sunday. Unless fully satisfied, Bear Stearns would immediately stop clearing LTCM's trades. Without a clearing broker, LTCM would be out of business. Period. To keep Bear Stearns, LTCM needed more equity capital. That's why Meriwether called Corzine: LTCM needed big money in a big hurry.

One billion dollars would be too little. LTCM needed $2 billion—and it needed it *now*. Corzine and Goldman Sachs were the best chance, and maybe the only chance, of finding a savior that would put up that kind of money that fast.

Goldman Sachs's overall business strategy had been shifting, in response to changing markets and business conditions, toward capital-intensive, risk-taking proprietary trading. That's why Corzine had been increasingly interested in

developing the kind of high-tech proprietary trading business that had been so profitable for LTCM. Now he recognized a major opportunity to move the firm decisively in the direction he believed best—a move that would also consolidate his position as the firm's undisputed leader.

Corzine knew his negotiating position vis-à-vis Meriwether had suddenly become very strong. Dealing from strength, he now offered Meriwether a proposition that was clearly tough, but just as clearly reasonable, given LTCM's grievously strained circumstances. For half ownership of LTCM, Goldman Sachs would provide $1 billion—partly from the firm's own capital and partly from its clients—and commit to raise another $1 billion from outsiders. With the money would come the intangible but obvious advantages of LTCM's having Goldman Sachs's strong, explicit, public support. In exchange, Goldman Sachs would not only own half of LTCM's management company but also set limits on LTCM's trading exposures (tantamount to taking full control of the fund's portfolio structure) and get complete knowledge of LTCM's investment strategies and analytic models, which Goldman Sachs could then use in its own proprietary trading operations.

The deal was conditional on Goldman Sachs's delivering the capital infusion and on an examination of LTCM's books, so both sides began working through LTCM's files immediately. Any deal involving a major commitment of the partners' capital would, of course, require approval of the newly formed successor to Goldman Sachs's management committee, the executive committee, but Corzine was increasingly thinking and acting not as a senior partner, but as the dominating CEO he envisioned himself to be.

As part of its insistence on maximum secrecy, LTCM had kept its long trades and its short trades at separate banks. Since the banks could not be sure the hedges were correctly paired, they had required somewhat more than the absolute minimum margin. If the hedges could each be paired up at the same bank, that extra margin could be released and the financial squeeze would be relaxed. Fine in concept, but as always, the devil would be in the details. LTCM did not run a simple business; it used extraordinary diversification to minimize the risk of any one position or specific group of positions going sour. As a result, LTCM had thirty-eight *thousand* different paired positions—with every pair carefully separated and each side housed at a different bank. Matching up all those pairs would take a lot of time. So LTCM was not only short of cash but also short of time.

The major irony was blatant: LTCM desperately needed *now* the $2.7 billion it had insisted that investors take back just months earlier. A Street-savvy guy at Bear Stearns gave a cold, blunt appraisal of LTCM: "It's all over. When you're down by half, people won't refinance your trades. They'll push the market against you. You're *finished*." LTCM's partners, sensing that LTCM might not make it, scrambled to protect their personal assets. One partner, recently worth half a billion dollars, was reduced to paying for work on his expensive new home out of his wife's checking account. Meriwether quietly put his own real estate in his wife's name.

Later some observers said Goldman Sachs's traders, working out of London and Tokyo, were selling short the positions they knew LTCM held and then, to cover those shorts, were offering to buy them from LTCM at depressed prices. Goldman Sachs was certainly trading actively, but if its traders were front-running LTCM, other dealers were surely doing much the same. In the global bond markets, the squeeze was on LTCM—particularly in volatility—and all the major dealers knew LTCM, with massive positions outstanding in futures and options, was massively short volatility. They knew LTCM would get increasingly desperate to cover its short positions, would have to come to them, and would have to pay up, greatly increasing their profits. Dealers all understood the rules of the market: if they knew enough about the way institutions were moving their portfolios, they could and would profit by using this market information in their proprietary portfolio operations. That profit opportunity was why Goldman Sachs had decided to get into proprietary trading in a major way and, as advocates told their partners, "learn to live with the conflicts of interest."

The month of August was cruel for hedge funds. Most lost serious money. But LTCM did far worse—its equity capital was cut down by 45 percent, or $1.9 billion, in that single month. August was the worst month ever for credit spreads. Irrational as it may have been in the long run, in the short run credit spreads expanded to record levels and moved strongly and "irrationally" against the historically "normal" assumptions so essential to LTCM's sophisticated market models. With the severe lack of liquidity in the market, LTCM couldn't sell portfolio positions to raise capital. It lost nearly $2 billion. LTCM also lost all hope of George Soros's delivering a major capital infusion.

Meriwether's regular monthly letter, containing some of the troubling news,

was faxed to LTCM's investors early in September. Leaked to the press, it caused traders at other hedge funds to sell out any positions they thought LTCM might hold and would now have to try to sell. During September, the spreads that LTCM had confidently expected would *shrink* instead kept *expanding* as other dealers and hedge funds made increasingly large bets against LTCM, knowing its positions were huge and that sooner or later LTCM would have to come to them.

LTCM's portfolio was still huge: $125 billion—and now fifty-five *times* its shrinking equity capital. In addition, it held a large package of high-octane derivatives. With another portfolio loss of less than 2 percent, the management company and the partners would be wiped out. In mathematical theory, the odds of such an event actually happening had been nearly impossible just a few months before. But in real markets, traders say bell-shaped curves have "fat tails"—events that are very unlikely but do happen and cause great damage, recently popularized as "black swans." The highly improbable was now threatening to become grim reality.

Corzine's concerns about how to deal with the accelerating problems at LTCM were magnified by large losses in Goldman Sachs's own proprietary trading portfolio. Because they used similar models and similar data, the firm's traders had been taking positions similar to LTCM's. Losses in the proprietary bond-trading portfolio were losses that came right out of Corzine's partners' pockets. And he knew that the last time Goldman Sachs had come close to an IPO, it had been stopped by, among other adverse events, losses in the firms' proprietary trading portfolios.

Goldman Sachs's long-planned IPO was due to come to market the very next month. For Corzine, the IPO was by far the most important trade in a lifetime of trading—the most important test of his professional career, particularly since he had become managing partner, and also the most important for him personally. While Corzine never seemed to care about wealth except as a convenience, if the IPO came off as hoped, his personal stake would be worth over $250 million. He would be a very rich man with massive liquid assets and, at fifty-two, the personal freedom to stay or to leave the firm.[1] But if the IPO was put off—perhaps for several years—Corzine's percentage stake in the firm would decline, perhaps significantly. And if the firm did not go public now, it could be years before another opportunity could be found to ensure permanent capital. During those years of deferral, partners' shares were sure to change, particularly for senior partners

who went limited and retired—a group that could include Corzine himself. Corzine was highly motivated to find a way to solve LTCM's problem, which was now the linchpin to launching the IPO.

Corzine understood that the major investors Goldman Sachs would be asking to join in a rescue had already been called—often several times—by LTCM itself. One specific possibility, already called several times, was obvious to everyone: Warren Buffett at Berkshire Hathaway. Buffett said he might be interested in buying LTCM's entire portfolio at its depressed market valuation, but he wanted no part of LTCM's management company or the LTCM partners.

Derivatives added a whole new dimension of pyramiding to the situation at LTCM. They had real potential for a disaster. LTCM had arranged seven thousand different derivative contracts with several dozen counterparties. Default on any *one* derivative contract could throw *all* those contracts into technical default. Their total notional value was spectacularly large—nearly $1.5 trillion, or $5,000 for every man, woman, and child in America—and they involved almost every major financial institution in the United States in the complex spiderweb that now had LTCM at its center.

Meanwhile, during the second week of September, trading losses kept hammering LTCM:

- On Thursday, $145 million was lost.
- On Friday, another $120 million was lost.

And during the third week of September, while initially less severe, LTCM's losses continued:

- On Monday, $5 million was lost.
- On Tuesday, $87 million was lost.
- On Wednesday, another $122 million was lost.

A tiny profit on Thursday was no help: Cumulatively, LTCM had lost over half a billion dollars in less than two weeks. In one month it had lost nearly 60 percent of its equity capital. And volatility spreads kept rising from one record level to another, driving still more LTCM losses.

Goldman Sachs was LTCM's only hope—and the capital gap it needed to cover had now jumped from $2 billion to $4 billion. John Thain, the firm's CFO and an increasingly central member of Goldman Sachs's senior management—a rational market technocrat with direct experience in the bond business—was moving into a key decision-making role. He didn't see a way to raise that much money for LTCM, but the firm would keep trying.

Another possibility was floated past Warren Buffett: a joint bid, perhaps with AIG, the giant and innovative insurer that had extensive experience with derivatives, for LTCM's whole portfolio *without* the management company. Buffett wasn't interested.

Corzine briefed president McDonough at the New York Fed, and McDonough called the other major banks. All agreed that an LTCM failure would seriously disrupt the nation's and the world's financial markets. Given the Fed's long-standing hands-off policy toward the capital markets, McDonough wanted to have a Wall Street leader take up the task of privately organizing a cooperative. But he and John Whitehead, Goldman Sachs's former managing partner and now chairman of the New York Fed, quickly agreed that no one person had the necessary stature or clout to do the job. McDonough accepted Corzine's offer to brief the Fed on LTCM's portfolio on Sunday, but fearing that any sign of urgency could upset the sensitive money markets, stayed with a previous plan to fly to London and sent his deputy instead. Before leaving, McDonough called Fed chairman Alan Greenspan and Treasury secretary Robert Rubin in Washington to warn them that LTCM probably couldn't raise the necessary capital.

Corzine was still hoping to find a solution, but he was hitting walls. Making contact with UBS's derivatives expert, who happened to be in New York that week, to ask if UBS would help, Corzine was surprised to learn that UBS was already LTCM's largest equity investor. Corzine was naturally angry about being underinformed or even misled—again—by LTCM. He would have to focus on Buffett.

As it happened, Buffett was with Bill Gates on a vacation float-trip in Alaska's fjords, where the sonic shadows of the steep mountains would break up cell-phone calls for more than an hour at a time. Buffett told Corzine it was okay for Goldman Sachs to work out the specifics of a Berkshire Hathaway takeover of LTCM so long as the management company and John Meriwether were specifically

excluded. Such a takeover would require $4 billion to $5 billion. Only Berkshire Hathaway had that kind of money on hand *and* a decision maker like Buffett. Even so, Buffett would probably insist on a co-investment by Goldman Sachs.

Realities were now slamming hard into LTCM from several directions. Reality one: Awareness was spreading that LTCM had not hedged its highly leveraged portfolio against the specific risk of market volatility and a flight to quality. Reality two: LTCM's major counterparties on derivatives trades were now about to lose $2.8 billion even if the market calmed. Reality three: The global markets were *not* calm, so derivatives counterparties' losses might *double* to $5 billion. Fed executives worried that the markets, which were sure to drop sharply if LTCM went into default, might not be able to trade at all. This could create a dreadful fourth reality: loss of order and even panic in the nation's and then the world's capital markets.

On Sunday, Corzine spoke again with Buffett in Alaska. Corzine was still unable to make a firm commitment of Goldman Sachs capital. His partners—particularly investment banking partners—were outraged by the losses already taken and the real danger that Goldman Sachs might be saddled with more risk, have its capital tied up for months or years, and might even lose it all. Corzine called the Treasury Department to caution against expecting a private-sector bailout. He encouraged the Treasury to arrange an emergency bank consortium.

In markets around the world, dealers complained that other dealers were trading against LTCM's positions. In those complaints, Goldman Sachs was cited for being particularly aggressive. On Monday, September 21, LTCM lost $553 million—over one-third of its remaining equity capital. With a $100 billion portfolio, this put LTCM's portfolio leverage up to an extreme level: Debt was one hundred times its equity capital. Even a tiny hiccup could now be fatal.

Bear Stearns insisted on $500 million in coverage capital, essentially a security deposit, and Chase accepted its obligation to provide that amount based on a previously negotiated loan agreement. LTCM actually got $470 million—not the full $500 million—from Chase and its syndicate of twenty-four banks because Crédit Agricole, the French bank, refused to honor its part of the commitment.

As a bond dealer, Corzine kept his options close to his vest while working to develop others. He had been working with Merrill Lynch's brainy president, Herb Allison, on the design of a collective approach involving Wall Street's lead-

ing banks, but was still hoping he would be able to preempt the collective bailout with a Goldman-Berkshire bid for the whole LTCM portfolio.

At 7:30 a.m. on Tuesday, September 22, the New York Fed hosted breakfast for Corzine and Thain of Goldman Sachs, Roberto Mendoza of J.P. Morgan, and David Komansky and Herb Allison of Merrill Lynch. Allison lacks a commanding physical presence, but his rational brilliance was clear to everyone. To survive, LTCM needed $4 billion. If allowed to fail, the losses to the group could total $20 billion. Allison summarized: "We're all in this together. This is a *very* complex problem and we all know that in order to work, a complex problem *must* have a simple answer. In addition, as the nation's leading financial institutions, don't we have an obligation to the public?"

The global context for LTCM's crisis was deeply concerning. Russia and South America were both moving toward recession. The Fed would not protect the banks that had lent to LTCM. Its proper position was that, as free-market participants, they should absorb the losses of roughly $300 million apiece. But the problem might not be confined to LTCM. Corzine, who got almost no sleep for four days, says today, "It scared the hell out of me." After two hours of discussion, the bankers agreed to explore a clever proposal developed by Mendoza of J.P. Morgan to divide LTCM's positions into two baskets—one of debt securities and one of equities—and then sell the securities back to the issuing corporations at discounts that would make the offering a proposition they could not refuse. That would leave the bank consortium to swallow a smaller, known, and limited loss. But the implementation details couldn't be worked out in the time available, so the group turned to their one remaining alternative: Allison's proposal for a consortium investment by all the major banks.[2]

Corzine was now engaged in a two-front strategic battle. On one front, LTCM was in extremely serious trouble and a solution, not yet in place, was urgently needed. On the other front, Goldman Sachs's own proprietary trading losses in just the past two months had totaled a stunning $1.5 billion. This huge loss, combined with falling equity prices, would oblige the firm to postpone the IPO on which Corzine had expended so much of his personal leadership capital. Moreover, the firm's losses were concentrated in Corzine's overseas bond positions, so he was losing personal stature within the firm. Those losses were now *partners'* personal losses. A few months ago, each partner "knew" what wealth he

might have with an IPO; now the partners faced real money losses. The double whammy concentrated their minds on Corzine and his adventurous trading. Understandably, they did not like what they were seeing.

That Tuesday, LTCM lost another $152 million. Now, with no alternative approaches, everyone focused on Allison of Merrill Lynch and his consortium strategy. The only way to achieve the necessary cooperation among so many banks and firms on such short notice would be for the Fed—even though it would not be proper for it to support any specific plan—to call a meeting of all the banks. This was agreed late in the afternoon, and a dozen major banks were informed that an emergency meeting would be held at the New York Federal Reserve Bank that very evening at eight. The four largest banks agreed to meet at the Fed an hour earlier. Merrill Lynch's plan would have sixteen banks each invest $250 million to reach the $4 billion capital infusion that John Thain had specified was necessary. If the group put up less than $4 billion, speculators would be too tempted to try to break the bank, as a decade before they had broken the Bank of England, forcing a devaluation of the British pound.

The four major banks were still arguing terms. Would the $4 billion be entirely a loan, or would some part have to be equity? Would LTCM's partners stay? Who would have control? On the last, Corzine was insistent: LTCM could *not* be in control. When the arguments went on past 8 p.m. without resolution, the other bankers, who had been cooling their heels, were brought in and told that while the Fed would maintain strict neutrality, it expected the private sector to find a workable solution to protect the integrity of the system.

Allison summarized Merrill's plan on one sheet of paper. Lehman Brothers objected to each firm's having to put up an equal share of the reserve fund; it proposed scaling contributions to match each firm's exposure. Others cut in saying that would be too complicated because each bank had its own risk model, so valuations—and "fair shares"—would differ way too much for resolution, given the shortness of time. Three hours later, at 11 p.m., the bankers' formal meeting was adjourned until 10 a.m. the next day. But informal work on specific terms continued until 1 a.m., when Corzine was briefed. Allison's plan could work—if everyone cooperated—and if it did work, it would be the first $4 billion fundraising ever done in a single day.

At ten the next morning, forty-five bankers assembled at the New York

Federal Reserve Bank. Bear Stearns's CEO, Jimmy Cayne, began with this blunt warning: "If you want this to work, don't go alphabetically"—don't start by asking Bear Stearns.

New York Fed president McDonough, who had just flown in from London, quickly postponed the meeting for three hours, saying only, "Not all avenues have been exhausted." He did not say that Corzine and Thain had just taken him aside to whisper that Warren Buffett was ready to bid for the whole portfolio. McDonough called Buffett and got his confirmation. Instead of feeling relieved, when the bankers learned of this, most were angry that Corzine was playing games with them behind their backs.[3] Such solo initiatives by Corzine had already angered the partners of Goldman Sachs.

Buffett's bid—joint with Goldman Sachs and AIG—came in at 11:40 on a single page: $250 million to buy LTCM, with $3.75 billion more to be invested in the fund immediately to ensure stability. (The $4 billion was just over 5 percent of the value of LTCM's portfolio only ten months before.) Of the total, $3 billion would come from Berkshire Hathaway. Buffett's bid was good until a 12:30 deadline—just fifty minutes away.

It didn't matter. The deal couldn't be made. There were too many different parties at interest with dozens of counterparties to derivative contracts, plus a series of hub-and-spokes partnerships. It would be impossible to reset all their different contracts. And unfortunately, the Goldman Sachs investment banker covering Berkshire Hathaway had misunderstood the complex structure of LTCM, so he had not given Buffett the specific guidance that would have been necessary to formulate a correct bid. Once again, the devil was in the details. Buffett's bid as written was for LTCM, the *management* company, not the LTCM *portfolio*. Even so, there was a chance: If the Goldman-Berkshire-AIG bid were converted into an investment in the fund, as opposed to the management company, it might work because Buffett's group could still fire the LTCM partners. But just then, Buffett's boat went behind an Alaskan mountain and he could not be reached by cell phone. Minutes ticked away. The time limit on Buffett's bid was fixed. The clock kept ticking, and in half an hour the time ran out—before contact could be made.

The only option still viable was the bankers' consortium bid developed by Merrill Lynch's Allison. Even though he was not sure they would all come, McDonough called in the banks. They did all return, but their mood had been soured by the

morning's events. Bear Stearns refused to participate, just as it had said it would. It already had more than enough exposure as LTCM's clearing agent. After a brief recess during which urgent pleas were made to it, Bear Stearns did agree to say to all the banks that it had no special knowledge causing it not to participate.

Tensions continued to rise as one after another banker got petulant and self-protective. Chase Manhattan's CEO, William Harrison, was furious: "Goldman Sachs is trading against the Street!" Morgan Stanley's Phil Purcell was in the consortium—and then out—until Allison said, "Call your capital-market traders and ask *them*." Purcell was told: "Herb's right. If you guys don't do this, and do it damn soon, it'll be a fucking catastrophe!" Then the French took a walk—followed by Bankers Trust's CEO, Frank Newman. During those tension-packed hours, it seemed that every bank was out of the deal at one point or another. As Allison recalls, "They were not seeing the big picture—how Wall Street would look to the whole world if the deal fell through and we failed."

Corzine insisted on signed contracts to lock in the LTCM partners, so they could be told exactly what to do or not do—a major change, of course, from his previous goal of partnering with Meriwether. Corzine called Meriwether to confirm that there would be full acceptance by LTCM of his tough terms. Nobody in the room at the Fed knew or suspected what lay ahead for Corzine, except Thain, who was taking calls in the conference room on his cell phone. Thain was speaking so quietly he couldn't be heard, but his facial expression signaled that he was struggling with grave concerns. He was *at* the meeting, but not *in* the meeting. He was providing updates on the negotiations to three other members of the Goldman Sachs executive committee. Those four would soon complete a coup d'état and oust Corzine.

The Merrill Lynch consortium plan assumed that sixteen banks would each commit $250 million, but when several banks refused to go that high, it was clear that the majors would each have to go up even higher—to $300 million apiece. Corzine, the only CEO who was also an experienced bond trader, had wanted to play the essential leadership role, but his partners were less caught up in the time urgency of endorsing the consortium strategy and were much more

concerned about the potential costs and risks to Goldman Sachs. They made this clear in messages via Thain's cell phone, which Thain then whispered to Corzine. Hank Paulson said it all: "Get the hell out of there!"

Corzine couldn't go above $250 million without the approval of his executive committee, which had only *very* reluctantly authorized $250 million. He certainly didn't have his partners' authorization for an additional $50 million.[4] Considering himself essentially the CEO of a major firm and an expert in bonds and bond trading, Corzine found it embarrassing to need his partners' permission. But he knew that preparations for the IPO, the large, recent bond losses, and the accumulating issues surrounding the firm's leadership made it doubtful that the partners could absorb yet another stress. Given the stupendous personal financial stakes involved, political alignments within the firm were still in play as individuals counted up "their" IPO wealth. Even Corzine, politically sensitive as he had always been, really didn't know now just what his partners would say and do. But he did know most would be enraged, and many disgusted, with a jumbo capital commitment to bail out LTCM.

With the table stakes now at $300 million, Allison was going around the huge table, calling out each bank in turn for its commitment. If Goldman Sachs and the other major organizations came in at $300 million each and a few smaller banks came in for less, the consortium would—just barely—have the necessary $4 billion, including what equity capital remained at LTCM. Lehman Brothers couldn't do a whole unit, only $100 million. Bear Stearns refused to participate at all. And everyone knew that Chase didn't want to participate.

As Allison continued around the table, collecting commitments from most of the banks represented—including Chase—Corzine turned to Sandy Warner, chairman of J.P. Morgan, who was sitting next to him. They had become friendly during recent talks about possibly putting their two organizations together, so the basis for man-to-man candor had been established. Corzine whispered: "My partners *really* don't want to do this. And if I do, I'll have a massive need to persuade—and I'll probably have to leave Goldman Sachs."

One bank after another committed to $300 million. Only two banks had not yet been called: J.P. Morgan and Goldman Sachs.

Suddenly it was Corzine's turn. "Goldman Sachs?"

Corzine, the cool trader, never blinked. As though it were the most ordinary item of an ordinary day, he said, "Goldman Sachs is in for three hundred."

Morgan too was in for $300 million—and the deal was done.* Herb Allison later estimated the potential losses throughout the financial system of a failure to solve the problem presented by LTCM at an astounding $50 billion.

Many details still had to be resolved. Goldman Sachs insisted that its lawyer, John Mead of Sullivan & Cromwell, had to participate in the follow-on negotiations, representing only Goldman Sachs, while the consortium would be represented by Skadden Arps. An oversight committee was established to supervise LTCM's portfolio. The consortium would get half the management company for $1. LTCM's partners were obliged to sign employment contracts, with compensation for the group fixed at $250 million, with no bonus or incentives—a drastic pay cut for that supercompensated group. Goldman Sachs's lawyer insisted that LTCM's partners give personal guarantees of the accuracy of LTCM's financial statements and that the new money invested by the consortium be guaranteed absolute protection from any future lawsuits stemming from past actions.

Sunday evening, September 27, Robert Katz, Goldman Sachs's chief counsel, startled the negotiators by stating that the firm would not stay in the consortium unless Chase agreed not to require payment on its $500 million loan to LTCM. Chase, which had already made several concessions, was not prepared to go that far. When Corzine confirmed Goldman Sachs's hard line, Chase's man exploded with expletives—and then, very reluctantly, agreed to leave Chase's $500 million with LTCM.

Goldman Sachs's executive committee would meet at 6:30 Monday morning for a final decision. But knowing that the consortium could not wait for such a critical decision, Corzine checked with some of his partners and got their okay to say Sunday evening that Goldman Sachs was definitely in the consortium for $300 million.

During the first two weeks of the new arrangement, LTCM lost another $750 million—and then it stabilized. Over the next two years, LTCM's positions were gradually liquidated—at a modest profit to the consortium—because, as markets

* This was almost certainly the largest-ever rescue effort by U.S. banks. The best-known previous bankers' pool, organized by Thomas W. Lamont of J.P. Morgan on October 24, 1929, during the Crash, began with $20 million (approximately $200 million in today's dollars) and was increased the next day to $40 million per bank. Over the next five weeks, the pool bought $129 million ($1.3 billion in today's dollars) of such major stocks as U.S. Steel, AT&T, General Electric, and American Can.

became rational again, the portfolio of perfect-arbitrage paired positions proved that Meriwether and his Nobel laureates were, as they always knew they were, very right. But Keynes was right too: "Markets can remain irrational longer than you can remain solvent." And bell curves do have fat tails.

Still, Corzine was not a corporate CEO, and he had clearly not gotten partners' approval in the only way major decisions, particularly decisions involving the partners' capital, had always been made since Sidney Weinberg set up the management committee as a governor on Gus Levy. Capital was the scarce resource at Goldman Sachs, and Corzine had committed a big chunk of the firm's capital at a time when his own area of the firm, fixed income, was incurring major trading losses. Capital would now be tied up in a deal that at the time seemed likely to have low returns, particularly in comparison to other choices available to the firm, and quite possibly the LTCM capital commitment would incur losses.

On Monday, September 28, after twelve years of preparation, Goldman Sachs canceled its public offering. Sure, an IPO could be brought forward at some time in the future, but fourth-quarter earnings were seriously disappointing. It could easily be several years before the market would again be right for a Goldman Sachs IPO. And for senior partners who wanted to go limited, deferring the IPO was tantamount to taking money right out of their pockets—money they'd so recently thought was as good as theirs. And they knew the man to blame.

33

COUP

In October 1998, Jon Corzine agreed to have breakfast with another partner at the Savoy Hotel, where he was staying in London. Two things made it unusual: It was seven in the morning—on a Sunday. And an article in the business section of London's *Sunday Times* carried a story that Corzine would be pushed out of Goldman Sachs by John Thornton and John Thain.*

"Have you seen the story in this morning's paper?" the colleague asked on the way to the dining room.

"Yeah, I saw it."

"What are you going to do about it?"

"I'm not sure."

"You should be sure, Jon. Since you're wearing a business suit, I assume you have another meeting scheduled this morning, so here's what you should do: Cancel any other meetings you've booked. Go directly to Heathrow and fly back to the States. Before you take off, call Roy Zuckerberg and Bob Hurst and tell them to meet you at your house in New Jersey today and make it absolutely clear

* Only the first edition carried the story, which apparently was quashed in all subsequent editions. But other newspapers carried references to the original article later that day.

to everyone that before the executive committee meets Monday morning, both Thain and Thornton are out—fired for playing politics and doing it in public so that it hurts the firm.

"If you do this immediately, everyone will understand and will back you. And if you don't, you'll be in real trouble, because in six months *they* will force *you* out."

"I couldn't do that," replied Corzine. "It would hurt the firm."

In ironic symbolism, Corzine and his guest could not have breakfast in the Savoy dining room. It was closed. It was never open at seven on Sunday morning.

In four months, Jon Corzine was forced out by four members of the firm's executive committee—John Thain, John Thornton, Hank Paulson, and Bob Hurst. Many small parts came together like the pieces of a jigsaw puzzle to complete the picture that Corzine had to go.

Corzine had offended the firm's investment bankers by unilaterally committing $300 million to bail out Long-Term Capital Management when he was authorized to commit no more than $250 million—and getting approval even for that had been a struggle. Bad enough to make huge capital commitments to proprietary trading activities they didn't fully understand, but bailing out another firm with such enormous amounts of their precious capital was going way too far. His various independent and secret sorties into merger discussions rankled, particularly his approaches to Chase Manhattan Bank, Morgan Bank, and, in early 1998, Mellon Bank. Corzine's informal, intuitive, undisciplined way of making senior-level executive decisions would not fit with the responsibility of a CEO of a publicly owned corporation. And his unilateral strategic thrusts were completely at odds with the "one man, one vote" tradition and structure of the management committee, as was his unbridled style of trading. Corzine was too unpredictable. Examples were numerous. The case against him had accumulated steadily over his four years as chairman. As one committee member explained, "Corzine made freestyle decisions on important questions again and again—literally hundreds of times." Another committee member recalled, "It was Jon's attitude and the way he did things—too solo, too sloppy, too unpredictable—and not appreciating or

even recognizing the importance of the executive committee." Another committee member concludes: "The code of conduct at Goldman Sachs was based on absolute candor and straight talk, but from day one Jon was not always straight or consistent, particularly with the people he worked with most closely."

The single most rigorously disciplined management process in the firm was the selection every two years of partners. It took a lot of everyone's time, and everything was done very carefully over several months. Still, there were always last-minute changes to the list, both additions and deletions. One year, as the executive committee was putting the final list of new partners together, Corzine exclaimed, "Oh, Jesus! I forgot so-and-so! Help me out, guys. I'm pretty committed and need your help on this one. I had a long dinner with him in Tokyo and pretty much promised him then that he would make partner this year. He's doing great work, and we've got to make him a partner. Please, guys, just one more!" Corzine may have been comfortable with improvising to circumstance—a necessary skill for traders—but to professionals experienced in the rigors of investment banking, improvisation was just being sloppy.

Paulson and Corzine were never good at working together. They didn't really like each other, didn't really respect each other's ways of leading or managing, and their businesses were completely different. At the weekly executive committee meetings, they didn't just disagree, they increasingly squabbled and bickered. "They were like teenage kids," recalls Zuckerberg, who had warned his friend Corzine during those UN Plaza meetings. To others on the executive committee, it seemed that Paulson and Corzine argued all the time, often quite bitterly. Partners went to Zuckerberg and said, "Can't you help? You know both guys and they both trust you." During one executive committee meeting, it got so bad—close to throwing punches—that Zuckerberg decided he had to do something, so he made Paulson and Corzine stay behind, closed the door, and said firmly, "You *must* work this out! It will hurt the firm if you keep it up." Paulson's accumulated frustrations were so wide and deep that he nearly left in late 1997 but was persuaded to stay. The committee spent one whole weekend trying to find ways to work it out.

In May 1998 Corzine offered that they should work as co-CEOs after all. Zuckerberg said tartly, "You two show you can really work together—for just six months—and *then* I'll support your idea." Looking back, Zuckerberg

laments, "Corzine as senior partner and Paulson as president—one a partnership title and the other a corporate title—made no sense. It was cockamamie. When Corzine said, 'Let's go co. It's fine with me. I don't give a damn,' he was wrong—wrong to think they could work together and wrong about Paulson." Still, the committee decided to accept Corzine and Paulson's commitment to try to work together.

That same spring, the firm decided to launch the initial public offering in the fall. But market turbulence originating with Russia's financial crisis compelled a postponement.

The conclusion that Corzine had to go was not based on any one thing. One part of the jigsaw puzzle was structural: Corzine's decision to maintain a six-member executive committee rather than a larger management committee and then, ignoring advice, to let Silfen and then Zuckerberg go limited without adding strong, loyal supporters of his own choosing onto the committee. Another was his treating the executive committee as not all that important and acting like an all-powerful, freewheeling CEO; the others on the executive committee believed the committee was the ultimate power in the partnership and that all decision making rested with that committee on behalf of the partners. A third piece of the puzzle: Corzine was so confident of strong support across the large partnership that he somehow didn't recognize that broad support could be trumped by the small executive committee. He had been losing support in the committee and should have known it had the power, if it wanted to, to take him out—not simply out of being senior partner and chairman of the management committee, but right out of the partnership itself.

Aborting the IPO in September after announcing it just three months before had been embarrassing, particularly to the firm's investment bankers. More pungently, postponing the IPO—after showing individuals exactly how much money they would make—was certainly disconcerting to the 200 owners, 345 additional managing directors, and 16,500 employees who would each have benefited. Moreover, Goldman Sachs, having lost nearly $1 billion in trading, often in positions similar to those that took down LTCM, was professionally humiliating to many at the firm. Tension between the firm's bankers and traders was

heightened when trading losses suddenly wiped away the distributable profits of a record surge in banking fees.

An important component of the case against Corzine came from the personal decisions of individual committee members. In 1996 David Silfen, having decided he wasn't going to be made managing partner and wasn't really interested in the job, felt he'd already done all he could do to build trading into a highly profitable power center. So other than loyalty to the firm and to individual partners, he saw no real reason to stay. As a trader, Silfen had an understanding of the business that was similar to Corzine's, so even though they had limited personal rapport, the two men usually had similar views on key decisions and Silfen almost always voted with Corzine.

Similarly, Zuckerberg enjoyed close rapport with Corzine and regularly supported him on decisions. As co-heads of Equities, Silfen and Zuckerberg shared a personal as well as professional understanding; they had worked together on an extensive and successful reorganization and a major strategic repositioning. Elevated to vice chairman in early 1997, Zuckerberg had built two strong businesses, had also gone as far as he could hope to go in stature and share ownership, was getting older, and was exasperated by the bickering at committee meetings between Paulson and Corzine. On November 27, 1998, Zuckerberg went limited—with an agreement that protected his ownership interest even though nobody thought an IPO could be relaunched in less than a year. He also offered some advice: "Jon, we've been friends for a long time. Please take some advice from a friend: You need to put some of your own people on the executive committee—people you can work well with and who will work well with you."

"Appreciate your thoughts, Roy, and really appreciate our friendship and how supportive you've always been, but I don't see a big need for change just now. We'll be okay."

"Jon, you really should think about it. They could bury you."

When Silfen retired, his seat on the committee was taken by John Thornton. Corzine's appointing Thornton indicated to some a good relationship, but the reality was more complex. Thornton opposed an IPO, which he saw as "only one hand clapping"; he felt that going public would inevitably lead to a megamerger with a major commercial bank and that the firm would be falling into the old trap of taking bold action before it had developed an overall strategy.

When Zuckerberg retired in 1998, his seat was left vacant and the executive committee was down to five members: Corzine Paulson, Hurst, Thain, and Thornton.

Other personal developments contributed to the growing opposition to Corzine. Thain had been posted to London for a year in 1995 before succeeding Corzine as chief financial officer. Corzine had known Thain well from their years as leaders in Fixed Income. They respected and appreciated each other and each other's skills, particularly in Risk Management. It was natural for Corzine to trust Thain and to send him as "one of my guys" to London. But Thain was not one of Corzine's deputies. Thain had always seen himself as independent and had always thought for himself.

In London, Thornton, a master of creating remarkable closeness in personal relationships with senior executives, bonded with Thain, an exceedingly numerate and rigorous analyst. Both men excelled at conceptual understanding and macro strategy. As a duo, Thain and Thornton were clearly stellar: an expansive "blue-water" conceptual strategist and creative top-level relationship banker paired with a computer-savvy CFO with highly successful leadership and managerial experience in Trading, Fixed Income, and Risk Management. Both had great experience and maturity, and both were young: Thornton was forty-one and Thain was thirty-nine. Neither was devoted to Corzine.

In 1994, Brian Griffiths, the firm's country adviser for the United Kingdom, had called Thornton to say, "John, have you heard the good news?"

"No, what have you heard, Brian?"

"Jon Corzine has been chosen as the firm's new senior partner. He's a real man of the people!"

"Damn! That's bad news, Brian. We don't need a man of the people. The firm needs a real leader."

Thornton had never met Corzine and had no opinion of him personally, but the firm was in crisis, and he felt the first priority in selecting a new senior partner should be strong leadership above all else.

Later, as a new member of the executive committee, Thornton quickly set the boundaries by telling Corzine: "Jon, you're in charge, so on ninety-nine percent of the issues that come to the executive committee, I'll give you my advice or volunteer my opinion but you'll make the ultimate decision. But one percent of the time—on the really big issues—I'll insist on the formal governance

mechanism in the partnership agreement and vote as one of six—as we all should. Okay?"

"Understood. Not a problem."

For a firm whose previous senior partners had been so dedicated for so many years to developing relationships with major corporations, Corzine's proprietary trading priorities were surprisingly different. His focus was on markets, not on client corporations. Walking along Park Avenue after a dinner, Gene Fife, who'd just spent several hours with IBM's CEO, Lou Gerstner, bumped into Corzine and asked, "Do you know Gerstner?"

"No."

"Would you like me to see if I can arrange a meeting for you?" Anticipating that the managing partner of Goldman Sachs—or any other investment bank—would jump at the chance to spend quality time with the accomplished CEO of one of America's great corporations, Fife was startled by the response.

"Why would I want to do that?" The obvious implication: Such a meeting would be a waste of valuable time. Corzine was still thinking like a proprietary bond trader. Later, as Corzine had more opportunities to meet one-on-one with corporate CEOs, he found he enjoyed it and—with his warm, avuncular, unpretentious style and open manner—was effective. He steadily increased his time commitment to corporate clients overseas.

Corzine repeatedly had "private" conversations with other partners—private from Paulson. "Don't say anything about this to Hank. We'll just keep it between ourselves—where it belongs for now."

As the pieces of the puzzle came together, a consensus developed among the members of the executive committee: Corzine was not the right man to lead Goldman Sachs—particularly as CEO of a publicly owned company—and he was not going to change. He would always be too sloppy and unreliable for the giant, fast-changing, complex business organization that Goldman Sachs had become. The organization needed discipline at the center.

With Silfen and Zuckerberg out, Paulson, supported by Thornton and Thain, needed only one more vote. Thornton and Thain understood Paulson to be planning to stay only two transitional years before passing the baton of leadership to them. Hurst now became the key man. He had been unhappy with Corzine for

a long time and had co-led banking with Paulson. Some thought it helped that Hurst, unlike the other three, was Jewish, which could be silently important at what had once been known as a "Jewish firm." While Corzine and his family were skiing in Telluride, Colorado, over Christmas break, Paulson, Thornton, Thain, and Hurst worked out an agreement: Corzine would have to go.

Timing matters. Within a few weeks the executive committee was sure to be expanded from its unusually small size when Zuckerberg was replaced. And once the firm went public, changes in CEO would be made by the board of directors, not by the executive committee. If they were going to move Corzine out, it had to be now. Decisions on who was brought into or taken out of the partnership had long been with the committee. According to the revised partnership agreement, to terminate Corzine as senior partner they needed an 80 percent majority of the five remaining active members of the committee—or four votes. With Hurst, they *had* four and 80 percent. Paulson, Hurst, Thain, and Thornton met and agreed to vote to remove Corzine as senior partner.

When speculating about the way the coup was organized, some partners point to early meetings held at Bob Hurst's apartment; others emphasize John Thornton's extraordinary skills at "blow your mind" strategizing; and others say, "Never underestimate Hank Paulson." Insiders see Thain's decision as a switch from supporting the man he knew and liked to a man he thought better qualified to head a public company.

Thain, who had known Corzine longest and was trustee-designate for the Corzine children's trusts, was chosen to tell him this cold-steel deal: Corzine would serve until the IPO was completed—to ensure at least the appearance of stability—and then would have to fall on his sword and leave the firm. He had to accept. They had the votes—and they had the power to reduce his shares *before* the IPO if he resisted.

Corzine had no accessible group to appeal to except the full partnership, and there was not enough time for that. As one partner explained, "If the decision had been put to the whole partnership, Corzine would never have lost his position; he was too popular and had too many loyal friends. But in the small group, when he wasn't looking, he could be—and was—blindsided. It was like living the history of imperial Rome."[1]

Corzine had tears in his eyes when told the surprise of a lifetime, but he

played it out like a man, calling key clients and the president of the New York Federal Reserve Bank, William McDonough, to say he had decided to relinquish being CEO but would still be co-chair.

While all the turbulence at the top was going on, the day-to-day work of the firm continued just as strongly and steadily as ever. Corzine insisted that renewing detailed plans for the IPO should be a decision of all two hundred voting managing directors, but Paulson and Thornton believed those decisions should be made by the executive committee.

Blithely calling the notion of a palace coup "inaccurate in every respect," Paulson went on to say to the press, with practiced air-brushing for public perception, "This is an evolutionary transition in management and governance, something that made long-term sense for the firm. The firm is doing very well and we thought it made sense to put these changes in place before the public offering. This was an evolutionary transition in management and governance."[2]

The IPO was completed on May 9, and on May 18 Jon Corzine's resignation was announced. Corzine was in a bizarre situation, and while he dealt with it straightforwardly, bizarre stores sprang up quickly. For example, Corzine's limo took him one day from his home in Summit, New Jersey, to Goldman Sachs headquarters in lower Manhattan. He did not get out. Being in the middle of an important call on his cell phone, he continued working from the limo's rear seat. While he continued his phone call, his driver called Corzine's secretary to bring some papers. A writer from *New York* magazine converted this brief happenstance into the core of a feature story saying that Corzine did this every day—working all day from his limo parked on the street next to Goldman Sachs's downtown headquarters.

While he focused on the IPO, Corzine also came close to organizing a group of investors to take over Long-Term Capital Management. But in early February 2000 New Jersey senator Frank Lautenberg announced he would not run for reelection. This gave Corzine the opening he needed—in a new field. As he explained, "I like to compete, and I like to win. Being in a campaign is the most competitive thing I've ever done." Corzine spent $60 million and won the election. He served part of a term in the Senate and then successfully ran for governor of New Jersey.

34

GETTING INVESTMENT MANAGEMENT RIGHT

One of the most profitable discussions in the history of Goldman Sachs took place over several weeks in 1995 between Hank Paulson and John McNulty. The essence of the strategy that they developed can be evoked by a simple analogy: The lovely eight-to-ten-foot trees we use to decorate our homes at Christmas would take twenty years to grow from seed, but the ones we buy are only six or seven years old; young sprigs are grafted into stumps with extensive, well-established root structures that provide so much nutrition that the sprouts develop and grow super-rapidly into full trees. McNulty—who had been consulting with Goldman Sachs Asset Management while on leave from the firm to recover from an early-age heart attack—convinced Paulson that grafting GSAM's investing onto Goldman Sachs's powerful distribution would produce rapid growth in assets managed and strong, almost riskless growth in profits.

Paulson assigned McNulty to work in GSAM with his friend David Ford. Things changed quickly at GSAM because Ford and McNulty were given important advantages compared to their predecessors. A decisive advantage was an agreement that their business success would be measured on the basis of the

market value of assets brought under management—that is, on GSAM's *capacity* to generate future earnings, not on current *reported* earnings.

"I had an epiphany," said McNulty, "that the correct way to measure the economic value of GSAM was *not* current profits, but accumulated assets under management—from which future profits and future growth in profits could be harvested." Traditionally at Goldman Sachs, each line of business, no matter how complex its inner workings, was always evaluated on a simple standard: Did you make money today for the partnership? That's the way it was and had always been with traditional Wall Street partnerships. But that's not the way it is in other businesses, such as oil and gas exploration, life insurance and annuities, and investment management. In each of these businesses, the first year of a major success appears to be a loser. The only way to understand these businesses is to use managerial accounting that recognizes the present value of the long-term increases in the economic value of drilling holes, creating customers, or building a franchise that will produce many years of *future* earnings.

Fortunately for GSAM and for Goldman Sachs, Paulson liked and trusted McNulty enough to listen carefully to his reasoning. Having watched M&A bankers sell asset-management firms to financial behemoths for surprisingly high valuations relative to earnings, Paulson was ready to recognize that McNulty and Ford had come to a crucial understanding about the best way to manage GSAM. GSAM's value was not current profits, but the accumulation of assets under management.

Changing the whole concept of how to measure success got strong confirmation from an unlikely source: the investment banking division. Goldman Sachs had been involved as adviser and banker in acquisitions of several asset-management firms and had learned how and why the market valued them so highly. This understanding was key to the transformation in measuring results and accountability that would enable McNulty and Ford to transform GSAM and its business. It meant that there would be no basis for complaints—and it might even be best for the firm in the long run—if the GSAM business was run at only breakeven for several years, provided it was adding substantial assets under management. With profits coming from a captive fee-based business, the stock market and debt-rating agencies would value those reliably recurring profits far more highly dollar for dollar than trading profits or banking fees.

When they took over from Steve Friedman in 1994, Jon Corzine and Hank Paulson were determined to decide once and for all what to do with GSAM—and how to do it. By agreement, Paulson would concentrate on improving internal operations while Corzine focused on making acquisitions. Paulson liked and trusted McNulty and listened carefully to what he had to say because he knew McNulty was a smart, conceptual, aggressive entrepreneurial realist. McNulty said of Corzine and Paulson, "They didn't really understand the investment business, but they asked all sorts of questions and their focus gave us energy for success." After starting out in Private Client Services, McNulty had moved from division to division, consistently in management and consistently successful. He spent hours and hours with Paulson, explaining the nature of GSAM's business and how it could be converted into a real success. The argument that the rating agencies were more interested in a million dollars of fee-based income than an equal million dollars of income from trading carried special weight with Corzine and Paulson since, as a private partnership without permanent capital, Goldman Sachs had a lower credit rating than its major investment banking competitors.

An expert observer of firm politics, McNulty viewed his career with engagingly sardonic good humor. "This is our last job at Goldman Sachs, David," McNulty warned Ford. "We are pioneers. And you know what they do: They fight the Indians, clear the land, and take all the big risks. Years later, folks build statues to celebrate the pioneers that nobody can remember by name—and the pigeons come and shit all over them. So, David, that's our destiny: pigeon shit."

Behind the banter were two successful partners with every intention of converting GSAM from perpetual widow-maker into another big Goldman Sachs success. As Ford and McNulty saw things, if the fee-based investment-management business could be built up substantially, GSAM could become important strategically to the firm and particularly to Corzine and Paulson, who were focused on launching the firm's IPO at the highest possible valuation. Paulson and Corzine had put Ford and McNulty in charge of GSAM with a clear mandate: "Build up the asset-management business so it at *least* moves the needle." McNulty told Paulson, "I'll stay until GSAM is profitable"—and he did stay until July 2001 and the first surge in profitability.

With Corzine and Paulson as sponsors providing air cover to protect GSAM from internal challenges from other divisions, individual partners, or even the

management committee, Ford, McNulty, and their team were off and running. Suzanne Donnahoe transferred in from Investment Banking, and David Blood moved over from the bond unit led by John Thain.[1]

McNulty and Ford were in a hurry to catch up with GSAM's opportunity. McNulty convinced Paulson that, to achieve success, the firm would have to hire top people from competing asset-management firms, which were also major customers of the other divisions, even if it hurt the firm in those other business lines. That's when Corzine and Paulson took the competitive gloves off by removing the constraints that had hindered predecessors. Not only could Ford and McNulty hire people from competitors, but they could now invest firm capital in building the GSAM business through acquisitions. In addition, GSAM was now free to compete aggressively for new business even though that business—new as it might be to GSAM—could be taken away from a firm that was an institutional client of Goldman Sachs's securities business. Paulson said he'd take the heat from other partners when their clients complained or punished the firm. He kept his promise to provide both air cover and capital.

Encouragingly, the firm soon learned that the institutions' bark was worse than their bite. While major stockbrokerage clients would threaten to cut off the firm if GSAM competed with them, with very few exceptions, the threats—no matter how loud or explicit—were just threats. The institutions needed Goldman Sachs and the liquidity the firm provided more than Goldman Sachs needed any one of them. And not only were the people making the threats a small minority among the institutional investors, but most of them did not and could not speak for their whole organizations. The institutional traders who cared most about doing block-trading business with the firm cared the least about competition at "bake-offs" for new pension accounts. With dozens of competitors vying for each account, they weren't about to stop or cut back on using their most important block-trading firm to reduce the competition by just one investment manager. And their senior executives, when push came to shove, would not ask or tell them to do so. So they bluffed and issued warnings, but the penalties rarely came through and never lasted.

The firm had always treated a dollar earned in asset management as no better and no worse than a dollar earned in trading, underwriting, arbitrage, or stockbrokerage. Yet even investment-management firms that earned only moderate

profits had market valuations twenty to twenty-five times their earnings, while trading businesses were worth only five or six times current earnings. In other words, the market value of a dollar of earnings in asset management was four or five times the market value of the same dollar earned in a trading business. The obvious imperative was to get control of assets, ideally by acquisition of capable investment units, and then apply the firm's power in marketing to gather in even more assets as rapidly as possible.

McNulty, who was never unnecessarily modest, acknowledged that he had great ability in recruiting strong people: "I believe in my nose for talent." In 1996–97, GSAM added two hundred new people, doubling its size and adding many needed skills, but taxing the infrastructure. Many new arrivals found there were no phones or desk space for them.

Ford, McNulty, Donnahoe, and Blood came up with a truly audacious plan, particularly for a business that seemed to be going nowhere. As McNulty put it, "We have to mirror Goldman Sachs's footprint. We have to be global *and* multi-product. If we are only a U.S. manager, we'll never be right for Goldman Sachs's strategic vision of the future. We *must* catch up and match the size of our ambition to size of our opportunity."

The proposition was so bold that it was either a bad joke or it was brilliant. Paulson decided that Ford, McNulty, Donnahoe, and Blood just might be right. For his part, Corzine was already out looking for asset-management acquisitions. As McNulty observed, "Jon Corzine couldn't wait to buy an asset-management business—or two or three—and the bigger, the better." He tried Robeco and then Mellon. Serious merger discussions were held over several weeks with Wellington Management in Boston, and discussions with T. Rowe Price were initiated but never got beyond the preliminary stage; T. Rowe Price wanted only an investor, not an owner. Corzine nearly acquired Grantham Mayo Van Otterloo (GMO), a successful quantitative manager in Boston, at a price that would have made GMO's Jeremy Grantham the largest Goldman Sachs IPO shareholder—but Grantham broke off the discussions. (Later, taking a strong position that the Internet boom *was* a bubble despite clients' optimism, GMO took a very conservative stance in investing; it missed the dot-com millennium market, and its assets fell from over $80 million to $20 million but then—after GMO was proved very right—zoomed rapidly to more than $150 million.) Partners Pat Ward and

John Thain contacted Stephen Zimmerman and Robin Jeffrey about buying their employer, Mercury Asset Management, the leading UK investment manager, for a suggested price of $5 billion. But they got little encouragement and probably would have encountered strong opposition within GSAM. While Corzine drove to acquire established management firms to get control of more assets, those closer to the business had a different focus; to them, the smarter buy would be a smaller firm with managers capable of handling much greater assets. "Buying on assets is buying the past," says Blood. "The smart buy is to lift out the top people and then help them build up the assets under management."

The strategy McNulty, Ford, Donnahoe, and Blood developed was almost as simple in summary as it was grand in scale of ambition and scope of imagination: "3 × 3 × 10"—three continental markets, three marketing channels, ten investment "products."[2] Their strategic summary was simple, but their ambition was no less than the total transformation of GSAM in just one decade of repetitive entrepreneurial innovations into a global asset-management powerhouse spewing profits like a lawn sprinkler.

In retrospect their multimarket, multiproduct strategy may be seen as a sure winner, but at the time the case for going ahead was not easy to make, particularly to that vortex of power, the management committee, where the dominant metric had always been current-year profits. When McNulty, Ford, Donnahoe, and Blood laid out their vision for the next ten or fifteen years, most partners scoffed that the ambitions they were discussing made no sense at all. *Those GSAM guys were actually advocating deliberately taking losses for years!*

The partners of Goldman Sachs had fought their way to the top of tough businesses, and the real power in the firm had always been the power of current profits. Instead of talking, as everyone on the management committee had always talked, about current profits booked and taken to the bank, McNulty & Co. were actually advocating accepting *losses* in GSAM for at *least* several years. To those on the management committee trained up in a cash-profits culture, it all sounded like smoke and mirrors. Losing money on purpose over a whole decade for something as abstract as "franchise building" in a business they really didn't know and understand made no sense at all—not any more than calling losses "investment spending." Losses are *losses*.

GSAM's business was still struggling with trivial profitability and had zero

stature within the firm or in the outside markets. Could it possibly be developed into a global powerhouse as one the world's largest, most profitable, and most rapidly growing asset-management businesses, delivering substantial, repetitive profits to Goldman Sachs? Brazen as they were—especially to those who had wondered "Why not close GSAM down as a totally lost cause?"—McNulty was able to persuade others his team's bold ambitions were realistic. As he explained to anyone who cared to listen, the 3 × 3 × 10 strategy boiled down to this: Three major markets would be addressed *simultaneously:* North America, Europe, and Asia. Three marketing channels would be developed *simultaneously* to reach three key customer groups: institutional investors, via direct selling and through investment consultants; other investment managers that had distribution and could offer third-party or subadvisory mandates to cover specialties like international investing, via direct selling and through consultants; and high-net-worth individuals, via Private Wealth Management. Ten investment products would be provided: money-market funds (through ILA), high-grade bonds, municipals, "quant" strategies, large-cap growth stocks, large-cap value stocks, small-cap stocks, international stocks, specialized funds subcontracted from other investment managers, and hedge funds through a fund of funds.

Stunning as it is that it took the firm's management long decades to "get it" about investment management, GSAM's history provides a crucial illustration of Goldman Sachs's unrelenting "try and try and try again" approach to building each of its many business enterprises: Select one or two very able, very ambitious and promising, but not yet proven young stars. Point to a far hill and say, "Congratulations! You are the Chosen One who can find a way to capture that hill. It will be hard—maybe very hard—but the firm expects great things of you. We *know* you can do it. Now, get going and . . . take . . . that . . . hill!" When success is achieved, congratulations are given to the successful young stars—and so is another, even more challenging hill. If success is not achieved, the firm selects another one or two very able, very ambitious and promising, but not yet proven young stars. If success is *again* not achieved, the firm simply selects yet another one or two very able, very ambitious and promising young stars to take the hill. Eventually, the hill gets taken.

McNulty was searching for acquisitions, ideally of small firms with strong investment products and track records but needing help in selling, where the

Goldman Sachs organization was so clearly powerful. The search was bolstered by the M&A specialty that partner Milton Berlinski developed. He ran a seller-rep business as an active intermediary between small and midsize investment-management firms—where Goldman Sachs's institutional sales force had long-established, close working relationships—and large banks, insurers, and other institutions that were buying investment managers as "strategic partners." Goldman Sachs was in an ideal position on both sides of a lively new market to earn good fees by putting combinations together.

In 1995, Herb Ehlers's Tampa-based Liberty Asset Management, which had been spun out of retail broker Raymond James & Company, was in discussions with Berlinski about his seller-rep services when McNulty took Berlinski to lunch and asked: "Do you know any good little managers with superior investment people who are weak in marketing that GSAM should consider buying?" Apart from the obvious conflict-of-interest question of how Goldman Sachs, recently retained as an agent, could quickly change to act as a principal, it was the right question at the right time. Negotiations for another large financial-services organization to acquire Liberty had just recently broken down, so Liberty was "in heat," and GSAM could initiate discussions sure that Liberty was for sale and knowing all the particulars Berlinski had been learning in his work as Liberty's seller rep.

Merger discussions moved ahead quickly, and McNulty and Ehlers developed good personal chemistry. Ehlers recognized the asset-gathering strengths of Goldman Sachs while McNulty was impressed with Liberty's dedication to investing. As McNulty described the situation, "Liberty had a solid growth product, and they had a team who were absolutely devoted to investing. If you call them at home on a weekend morning, they're doing what they love most—reading annual reports! It's a passion, a personal passion. They're so dedicated to investing, you could call them addicted."

Adds Ford: "We brought good things to the party too. First, we had strong distribution and could raise a lot of money for Liberty, enabling their people to realize their personal dreams. Second, we had some pretty sophisticated expertise in risk analysis and risk management, and showed them how they could cut back any unnecessary risk in their portfolios.[3] Third, we would give them the security and confidence of having a major organization behind them, which enabled them

to focus on their true passion: investing. Indirectly, we would also help them stay organizationally disciplined because we had a big stick in our hands. GSAM had the option, written right into the contract, to bring everybody at Liberty from Tampa to New York if things at Liberty didn't run smoothly."

But getting the final agreement signed was not easy. Herb Ehlers threatened to abort the deal after he saw draft legal documents. The lawyer working for Goldman Sachs may have known contracts and acquisition law very well, but he overplayed his hand in writing the terms because he didn't understand the key to successful mergers and acquisitions in a service business: trust between the key principals. Goldman Sachs's banker on the deal had let the lawyer take control of the contract, and the lawyer wrote every part of the merger agreement to GSAM's advantage. Item for item, the results were different from what Ehlers thought were accepted understandings. Thinking GSAM was trying to pull a fast one on him, Ehlers got angry and—at least as much in sadness as in anger—declared, "The deal is off."

After weeks of negotiations, McNulty had gotten to know Ehlers well and sensed there was something not yet settled. Somewhere, somehow, he just *knew* there was a way to save the deal. But what could it be? "Of course!" said McNulty to himself. "It's Yom Kippur." In drawing his line in the sand, Ehlers knew that Berlinski, the partner from the investment banking division who was supervising the deal, would be unavailable because he would be at temple, so GSAM wouldn't have its expert working in between the two principals. McNulty and Ehlers would be on their own. To McNulty, that showed how savvy Ehlers must be: "Since he's that smart, we *had* to win this deal because a guy that smart could be a control player for the future of GSAM." McNulty went to Corzine and explained the whole picture, but Corzine didn't get it. He tried to calm McNulty down, saying, "You win some and you lose some. We'll be okay." But McNulty couldn't calm down.

He quickly went to Paulson next and said, "Let's catch the seven a.m. flight out of Newark." Paulson agreed, and when they got to Tampa, they swung into action, making the strongest pitch they could. "Herb had the contract in front of him and we could see he had lots of marks on it—page after page. Our only hope was to go through it item by item." As Ehlers identified items he didn't like, McNulty would ask, "What *would* you like, Herb?" Item by item, Ehlers said

what he wanted and thought had been agreed. Item by item, Paulson said one word: "Done!" Paulson said that one word a dozen different times. "Done!" "Done!" "Done!" After all the marked items were resolved, Ehlers said, "We'll go into another room and discuss among ourselves all you've said, and then we'll vote." After half an hour's discussion, Ehlers's colleagues came out smiling. They had voted yes.

The next priority was to make it clear to everyone at Liberty that while they all could remain in Florida, GSAM was in charge. McNulty recalled how he did this: "I told the guys at Liberty they could stay in Florida, but that I had a big inventory of warm winter coats in a big closet, and if performance ever went south and stayed there, I was going to send those coats to Tampa because they were *all* coming north—to stay. Naturally, this made it very clear to everyone that they better produce consistently good performance numbers. And the results of this enforced discipline were great for them—and great for us."

When the acquisition's final closing was only one week away, Ford called Ehlers to say, "It's important that we all agree on one thing. There's only one franchise or brand and only one vision for our future together. On the day after the closing, I'll call your office and there are only two possible ways for your folks to answer: 'Goldman Sachs' or 'Goldman Sachs Asset Management.' And you'll want to print some business cards—not many, but some—with 'Liberty' in big letters and 'Goldman Sachs' in smaller type right under it, and then we'll switch to some cards with 'Goldman Sachs' in the larger type and 'Liberty' under that in smaller type, and *then* we'll switch to new cards—and you'll want lots of these—with only 'Goldman Sachs Asset Management.' Always remember, Herb, *we* are the brand."

A few days later, when Ehlers was at Goldman Sachs's office in New York City, Ford walked him over to the large picture window with a great view of lower Manhattan looking south toward the outer harbor and said, "Look out this window and tell me what you see."

"The river, the ferry, the Statue of Liberty . . . and Brooklyn. Why?"

"Keep your eye on Brooklyn. *That's* the objective. I'll find a way to get you over there—ferry, tunnel, helicopter. You keep your focus entirely on Brooklyn, and don't even look at the river." The message was clear: Liberty should focus on investing while GSAM accumulated assets through selling.

A few years later, another round of negotiations developed over Liberty's five-year payouts. Ehlers called McNulty: "I've been looking again at the earnout, and I realize it's not fair. We've done great work in recent years, but if our part of the market—growth stocks—suddenly goes against us, we'll come up short on performance, and our investors will disappear. We could be hurt badly by some fluke in the stock market."

"Sounds bad to me too. Tell you what, Herb. You're a proprietor. You've sold Liberty once before and then bought it back, so you study the whole situation and if you can come up with a fair rearrangement, we'll do it." In the end, Ehlers worked out a better buyback deal than McNulty ever could have proposed. McNulty returned the favor: "I did suggest that they take 50 percent in Goldman Sachs stock. They agreed and that worked *very* well." Goldman Sachs stock doubled and then doubled again by 2007.

The original deal for Goldman Sachs to buy Liberty was done in 1995, when Liberty had $4.5 billion in assets under management. Ten years later, assets under management were at $23 billion and rising, because GSAM had such strong distribution. GSAM had paid $80 million for Liberty. After a decade of strong asset buildup, the buyback by Ehlers's group valued it at over $2 billion.

GSAM was looking for more of the same and found a likely target in Rosenberg Capital Management (RCM), one of the finer investment firms on the West Coast. Claude Rosenberg was surprised when Berlinski, the Goldman Sachs banker managing the intended sale of his investment-management firm, suddenly went from being his agent to being a principal, saying, "We might be interested in buying your firm for Goldman Sachs." This again raised all the classic questions about conflicts of interest, but Rosenberg decided to go ahead with discussions with GSAM.

For GSAM, it soon developed, the underlying problem with acquiring RCM was business fit. RCM had a small international investment product that it really wanted to continue. But Goldman Sachs was already a well-established international investment bank with offices in every major country and significant research being done on all the major economies and most of the major corporations from its regional headquarters in London, New York, and Hong Kong. It

would be hard for the firm to justify to clients or prospects having another international investment product headquartered in San Francisco. "A great city for living it may well be," says Ford, "but it's not considered a center of international investing compared to London or Hong Kong or New York." So keeping RCM's product separate would be a problem. "We'd be buying business we *knew* we were going to lose—and should lose. Not a smart move."

A larger problem was in bond management. GSAM had bond management and RCM had bond management, and the two bond operations were similar in investment style. The obvious answer was to bring RCM's bond assets and some of its key people to New York and combine them with GSAM's team into one major operation. But the RCM people, as settled San Franciscans, were not about to agree to that. And GSAM couldn't agree to pay a full price for a duplicate bond business when having two similar units would be confusing for clients, prospects, and the consultants who advise institutional investors on selecting managers. "We'd have had 'channel conflict' all over the place," says Ford. "And there were other problems. San Francisco is too far from New York, where GSAM had its headquarters. Claude Rosenberg had great stature in the pension market, but he had retired and nobody had filled his shoes. In addition, they had some interesting internal politics, and they had no new-business pipeline." So, after giving serious consideration to acquiring RCM, Ford and McNulty decided to take a pass—and kept looking for other firms to acquire.[4] It didn't take long.

"Did you guys see what I saw in today's *FT*?" It was still the spring of 1995, and George Walker had just come over to GSAM from Investment Banking. Highly regarded as a strategic thinker, Walker would effect three significant acquisitions in 1995–96—each valued not for the assets that were currently under management, but for its distinctive investment capabilities that could, with Goldman Sachs's prowess in sales and business development, lead to major increases in assets under management in five or ten years.

Walker was waving the *Financial Times* over his head and smiling. He saw an opportunity in the British government's decision to privatize the management of the British Coal Board's pension fund. "The auction for the right to manage the British Coal pension scheme has been declared a 'failed auction,' so there was no sale. But that doesn't necessarily mean that it's game over. I know I may sound crazy, but I'll bet we could negotiate to acquire the British Coal mandate if we

act very quickly and make a decent offer." Would-be managers were expected to pay up front for the right to receive management fees for a fixed number of years, guaranteed by the British government.

"But, George, what in the world would we be buying? It's just a contract to manage two big pension funds—and for only seven or eight years. Not exactly hard assets, George."

"You're right—but you're wrong too. You're not looking at this for what it really is. Here's the way to see the value here: The UK pension business has long been closed to outsiders like us. Four big *British* investment firms—with four *British* consulting actuaries guarding the gates on new manager selections—control almost all the UK pension business. As things stand today, we'll never get in. But, if we can win the Coal, we'll suddenly be on the inside. We'll be able to show the consulting firms what we can really do—and they'll have to pay attention because we'll be out of the holding pen where they keep all the non-UK investment managers like GSAM. We'll have at least a toehold that we can then build on. If we produce decent investment performance and show we know how to build and manage a major investment organization, we can launch a total-immersion sales campaign to win over the consulting actuaries so they'll bring us more and more business. At the very least, they'll give us a decent chance to win business by including us in more of the beauty parades they now arrange when their clients are picking new managers."

The Coal Board had gone through two failed auctions. The senior investment managers were dead set against a UK acquirer because they knew they would all get made redundant and terminated because the acquiring manager would already have people in all the key positions. With five hundred thousand coal workers' pensions depending on it, the British government clearly wanted a strong buyer because the government had a contractual obligation to cover any shortfall due to poor investment performance by appropriating new money. This meant that good risk controls—a major strength of Goldman Sachs—would be particularly important.

Walker argued that if Goldman Sachs could get the mandate and be the Coal Board's manager, that would be the firm's ticket of admission—the key to open all those closed doors. "With £25 billion in assets, it brings us up to scale. We won't be really big, but we will clearly be a presence. With all the stockbrokerage

commissions that the Coal generates, we can buy all the best investment research in the City of London. And we know from our brokerage work with them that the guys at the Coal [pension fund] have a pretty good portfolio team and pretty good research. But they don't do *any* marketing, so we'll do all the marketing and business development. And we can base our pitch on the truth; we bought this team because we believe in them—and that's why prospects should buy in too!"

GSAM had only twenty-five people in Europe, but decided it would bid for the multiyear contract, knowing that the Coal Board had problems with staff, problems with information technology, problems with operating procedures, and surely problems GSAM didn't yet know about. GSAM figured it had three two-year blocks of time to work within: two years to fix the problems, two more years to run the Coal Board funds and establish a good performance record, and two years after that to build assets through selling services to others.

"The Coal Board's senior people assured me in our first meeting that we would be getting a great team," recalls Ford, "so I said to them, 'Great! If they're as good as you say they are, this is the best deal in the world for them because with our marketing organization, we're really going to grow this business.' "

GSAM had an interesting proposition to sell to the investment consultants. They knew Goldman Sachs had staying power and would see this acquisition as a solid commitment to the UK market. The consultants were worried that the investment business was consolidating so much that it was virtually imploding. Only four important UK investment managers were still standing—down from six two years before and way down from twenty important managers fifteen years earlier. With only four investment firms left, the consultants were afraid of losing any more. As Blood said, "The whole market was really ready for strong, new managers like us." Ford quickly saw the opportunity and gave his strong support: "It was like a free option. If we have an up stock market, and we perform at least decently, we'll have had a big win. If there's a down market, we'll get our purchase price back through management fees and we've lost nothing." GSAM paid $75 million for the contract and, over the next six years, received $95 million in fees.

"We made lots of mistakes with that acquisition," remembers Blood. "But one after another they were corrected during the integration process. We made major investments in IT and in people, and it took us five years to reach break-

even, but when we did, we had a big, strong business base in the UK and a platform for all of Europe." Some in the firm judged that while McNulty cleared the land, laid the foundations, and built the ground floor, all the upper floors of GSAM were built by David Blood.

British Coal was an acquisition that became a real marriage because it gave GSAM market visibility and showed GSAM the best practices in client services. The Coal Board acquisition obliged GSAM to produce written definitions of several different portfolio-management capabilities. Over the next several years, this formalization developed into a major competitive advantage because large accounts increasingly wanted one or two managers with broad investment capabilities who could take responsibility for as much as half of their total fund—and then have a few smaller managers as outriggers to keep the major managers on their toes. GSAM focused its marketing efforts on the consulting actuaries as powerful gatekeepers. The best new-business opportunity was as a specialist manager, rather than a generalist managing all kinds of investments, as had been the British tradition—and GSAM was all about multiple specialties. McNulty's team set out to build the major business they now envisioned for GSAM.

Over the next decade, the business growing out of the Coal Board acquisition grew fortyfold—from $2.5 billion to $100 billion of assets under management—because GSAM's distribution was so powerful. Two major external changes played directly to GSAM's advantage: The United Kingdom's leading fund managers—Mercury Asset Management, Gartmore, Schroders, and Phillips & Drew—all suffered either poor investment performance or major internal organizational problems while GSAM's Coal Board acquisition did well. And the UK pension funds and manager-selection consultants, or consulting actuaries, shifted their focus from "balanced" managers to specialist managers—which was what GSAM had become as it demonstrated its capabilities to perform. The selection consultants—which most UK money managers disdained professionally—were the center of GSAM's attention. After two years of observation and intensive courtship, the consulting actuaries became convinced. Given their influence at most major funds, GSAM's focus paid off handsomely.

Internal changes were made too. GSAM compensation was separated from firm results and based much more than before on each individual's contribution. Each investment unit got incentive compensation based on its own investment

performance. Blood and Donnahoe hired in a team of strong sales executives, set up an incentive compensation plan, and made it clear to all that bringing in the business was *the* priority. By 1998, GSAM's assets under management had grown enough for it to add effective salespeople to cover the Continent—where the same manager-selection consulting firms were powerful, specialist managers were becoming important, and the local competition was caught napping. After that, expansion in Asia was almost simple: replication of a strong sales and service organization to gather assets to be managed by the proven investment teams in London and New York.

The implementation of the 3 × 3 × 10 strategy was described with obvious satisfaction by McNulty: "Each product is a separate focus of energy. Centralized 'manufacturing' (managing investments) and local distribution make for the best business. We want to have the best team in each product. And in marketing, GSAM is like a Roach Motel: more assets come in than go out every day. We have balance without conflicts, and the operating units are small enough for each team to have real ownership commitment."

As Paulson and Corzine were quickly learning, the underlying economics of investment management as a business are marvelous: Assets grow almost automatically at an average annual rate of nearly 7 or 8 percent compounded because the stock market averages that kind of growth; since new assets can be added onto that base, annual growth averaging around 15 percent seems surely sustainable—which doubles assets in less than five years. Even 20 percent annual growth is not unusual, and *that* doubles assets every three and a half years.

GSAM continued to get better and bigger at gathering assets, which, from the owners' perspective, is the surest way to maximize profits and wealth. When investment management flourishes as a business, commitments to client service, investment professionalism, and quality control often fade. What's right for an owner is not necessarily what's right for a client, particularly when business incentives trump professional disciplines and conflicts of interest develop. For example, GSAM had explosive early success in Japan, raising $10 billion in mutual funds whose performance was enhanced with a winning dollar-yen play. But a little later, that extra foreign-exchange lift got reversed and assets melted away as Japanese brokers urged disappointed retail customers to sell and move on to their next "opportunity." Fees were high. In a global bond fund, it cost 5 per-

cent to buy in plus 1 percent annually for management *plus* 0.5 percent for custody and 3 percent to terminate. There was no way investors could profit: Fees were too high, even relative to an optimistic estimate of value added.

Financially the Japanese failure had a silver lining, at least for GSAM. Profits in Japan on that first fund's introduction paid for the worldwide buildup of infrastructure for GSAM. "We knew that if we didn't globalize GSAM," explained McNulty, "other divisions or the firm's local offices would set up asset-management business units in any decent market we left uncovered. So we had to move quickly and preempt internal competition from our own colleagues. Every business should stick to its real strengths; Goldman Sachs's strength is selling. And we wanted to sell captive GSAM investment capabilities because raising capital for other investment-management organizations is a lose-lose proposition for GSAM. If the manager does well, they'll drop GSAM and use their performance record to raise future funds on their own, so GSAM loses. If their performance is poor, GSAM loses, period. The much better business model is to organize a fund-of-funds business with GSAM in control of the client relationships."

McNulty became convinced that "alternatives"—including private equity and hedge funds of all sorts—would be important, but he says, "You can't mix long-only investing and hedge funds in the same organization because the fee structures and profitability are so different; they are almost contradictory, and the requisite people skills and disciplines all differ. The economics and profitability are too different, the management styles are too different, and the internal glory is too different. How can you help but know that the hedge-fund business is so lucrative that it *has* to be your first priority? Besides, with hedge funds in a large organization, the incentives for hot managers to go out on their own are way too big."

The answer was to acquire an "alternatives" manager—ideally in a different city—and run that business separately in "production" but as part of a coordinated combination in marketing. Goldman Sachs did that in 1997 by acquiring Commodities Corporation, a $3 billion manager of managers or, to use the current term, a fund of funds.[5] During the 1970s, Commodities Corporation's returns had been superb, but the company "knew" that performance was everything, didn't believe in marketing, and culturally couldn't accept salespeople. As a result, it couldn't raise the money it could have managed, so revenues from fees covered costs only if and when investment returns were over 20 percent per

annum and large incentive fees were earned. In 1998–99, investment performance was dreadful, and the company had to find a white knight quickly to take it over. The fit with GSAM was obvious. Anne McNulty, with consulting experience at McKinsey, was working as a consultant on information technology and human resources for Commodities Corporation. Her husband turned to Ford and grinned, "David, you always wanted to hire Anne. So now you'll have your cake and eat it too."

Operationally, Commodities Corporation broke up its total portfolio into many different subportfolios, and each manager ran his own piece. The returns were additive, but owing to the structured diversification, the risks were *not* additive: They offset each other, so total risk was significantly lower—the investor's holy grail. In a fund-of-funds business, returns are worth much more from the business owner's perspective because the risks are diversified down to a very low overall risk level. McNulty had known Commodity Corporation's CEO, Rick Hillenbrand, for years, and the two men liked and trusted each other.

Late in 1998, Commodities Corporation organized a series of "boutique" specialist investment units—across ten different asset classes—pursuing four common objectives: Know the risks in the portfolio and in the markets and then take only "on-purpose" risks—and reward investment managers explicitly for success. Diversify the portfolio widely to get a hundred different risk-reward decisions rather than having a portfolio driven by just one or two dominating decisions. In research, avoid stale old models and invest in developing the best models for the future. Take a global perspective. Since the world has many, many markets, understand and use their differences to capture true diversification.

"Commodities Corp gave us a big platform for entry into hedge funds and private equity," recalled McNulty with a smile, "and it had zero marketing capability, which was *our* great strength. One other thing: It was losing money when we bought it, so we bought them for just the value of their office building and the land around it—$11 million." Ten years later, Commodity Corporation's fund of funds had assets under management of many billions.

Organizationally, having co-heads of structural units like GSAM is strongly supported by the Goldman Sachs culture. It certainly costs more to have

two leaders, but it's worth the money because the value is increased even more than the costs. While one unit head is at the firm developing alpha (superior investment results not directly correlated with beta, or market risk), the other head is out meeting with clients and prospects. As Ford says, "Teamwork can work *very* well if you truly believe in it."[6]

In 1999 and 2000, GSAM lost money. In 2001, it made $25 million, a laughably tiny amount within Goldman Sachs. But then in 2002 profits jumped to $120 million, and in 2003 they surged to $250 million. And in 2004 everybody noticed as profits kept soaring to nearly $1 billion, making GSAM a major contributor of repetitive rising earnings.

As McNulty had mused, "The pioneers get all the arrows." Even as his strategy was proving itself, McNulty got more than his share. GSAM's profit progress before he retired in 2001was simply not fast enough for the traders, who were increasingly impatient and increasingly powerful within the firm. Nor was McNulty moving forward fast enough with his missionary educational campaign to teach everyone how to understand what it had and what it was getting. And while most senior people made articulate declarations about the importance of international experience and urged their best young people to develop experience in several different areas of the firm, most of the members of the management committee spent most of their careers in New York City and concentrated all their careers in one part of the firm's business. It was a classic case of "Don't do as I do, do as I say."

The earning power of GSAM is now quite formidable. The burgeoning profitability was invisible until it was already too late to change basic strategies and came after all the most important concepts had been proven by superb execution. Results were excellent in 2006. Its long-short quantitatively disciplined funds were up over 20 percent net of fees while many hedge funds faltered; most competitor funds were down somewhat or were up by only single digits. Given client demand, the firm estimated it could add another $2 billion in assets under management over eighteen months. In terms of absorbing a manager's capacity to add value, however, adding $2 billion to a hedge fund, because of its intense trading, could be like adding $30 billion to a long-only portfolio. To be sure of getting paid for the scarcity of capacity in its hedge funds, GSAM raised its fees from 1 percent base plus 20 percent of returns above a low hurdle to 1.5 percent plus

20 percent. GSAM had $100 billion in quantitatively disciplined portfolios—$50 billion in global tactical asset allocation, in which a manager makes frequent price-sensitive adjustments in a worldwide investment portfolio, and $50 billion in "enhanced index" funds—and believed it had capacity for another $100 billion. As partner Bob Litterman explained, "The firm tracks the trading cost, which now runs about 10 percent of our alpha, or value added. As this creeps up, we'll have to decide where and when to close this unit to new business."

A hot seller in the market is a product with a guaranteed return of principal, usually with a seven- or eight-year life to maturity. As with a zero-coupon bond, the investor can be guaranteed the $100 "par value" principal with $70 invested in available securities, and can then invest the other $30 opportunistically. People in other parts of the firm wanted to sell this product but insisted they needed to see GSAM's actual positions to price the product properly. But GSAM leaders didn't want to show them everything, knowing their own colleagues would trade against GSAM, particularly if there was a market crisis. That's why Goldman Sachs's leadership will be challenged again and again to manage an aggressive dealer organization and an asset-management business in the same firm. Asset management is a profession full of fiduciary responsibilities, not a caveat emptor business.

With the surge in business during the first half-dozen years of this century, the firm had to be careful not to maximize reported profits rather than reinvesting to build an even larger, stronger business. "To build a great asset-management business, the key decision makers have to love the business," says Blood. "That secret ingredient is crucial." With scale come challenges. The importance of person-to-person bonds of friendship that have been so important to the strength of GSAM are hard to sustain in a truly global business with ten categories of investment products and thousands of customers with many different needs in hundreds of cities.

While building a large global business, GSAM had a surprisingly personal touch in its nature, particularly among those who joined the firm under the Two Johns. When John McNulty's father died of a sudden heart attack at seventy-two in the late 1990s, McNulty turned to David Ford: "We never had much money when I was growing up. My dad was orphaned at thirteen and got little education. He worked hard for what little he got paid. He never once saw Easy Street. So I

want to go all out for my father and give him a truly special burial. He was from Philadelphia, and I'd like to arrange it at what has to be the finest country club in the area. You're a member at the Merion golf club. Could you arrange it for me—for my dad?"

"Great idea! I'd be very glad to arrange it."

"David, that would be wonderful."

"And it *was* wonderful," recalls Ford. "Merion is really such a special place. And it was a beautiful day. John hired Ronan Tynan, the great Irish tenor, to sing Irish songs. Flowers were *everywhere*. Nice food. Lots of people came and they all had a *very* good time."

Only later, after it was all over, did McNulty tell Ford something he'd never told anyone at the firm because it had never mattered. His dad had worked for many years as a groundskeeper—at the Merion golf club.

35

PAULSON'S DISCIPLINES

Some of the most difficult and important decisions for individuals and for leaders of organizations are "not" decisions. Decisions not to marry Alice or Sam, decisions not to take a job offer or, in a business, decisions not to acquire or merge. So it was for Hank Paulson and his decision not to combine with J.P. Morgan. At the time of decision, Paulson was classically alone at the top.

One strategy advanced by some at Goldman Sachs had been to achieve public ownership without going through the stress, uncertainty, and distraction of an IPO by combining the firm into a publicly owned bank. Chase Manhattan was mentioned most frequently. But after some initial exploration by Jon Corzine, that idea had not been pursued. At the Arrowwood meeting, John Thornton had protested that doing an IPO without a clear strategic vision of the organization's future and of how going public would advance that vision was like only one hand clapping. He went on to say that the firm's going public would almost inevitably lead to a merger . . . with a big bank. Then, to illustrate his point and give it specificity, he had said . . . with J.P. Morgan.

Later, after Goldman Sachs went public in 1999, the firm gave serious consideration to combining with J.P. Morgan. The prevailing view was that all

the leading investment banking firms would have to have big balance sheets to succeed—or even to survive. Advocates of the merger pointed to how commercial banks had bought control of securities firms in London after Big Bang and how Citibank, having recently combined with Travelers, had acquired Smith Barney and Salomon Brothers. In most countries, commercial banks owned or were buying into investment banking firms and using their big balance sheets and price cutting to force their way into the business. The trends, many believed, were irreversible, and the mistake would be to stay romantically attached to the old separation of investment and commercial banking and try to compete without the strategic imperative of the future: a big balance sheet.

Corzine and J.P. Morgan's chairman and CEO, Douglas "Sandy" Warner, had had preliminary conversations and one meeting to explore a possible merger and had developed an easy rapport. After the IPO, Paulson followed up on Corzine's conversations by accepting an invitation to a private luncheon hosted by Warner at J.P. Morgan, where they talked about reviving those conversations. The two men were cordial to each other, but the luncheon led nowhere. After several months passed, Paulson invited Warner to breakfast at Goldman Sachs, after which they went to Paulson's office. As usual, Paulson went directly to the point: "We've done a lot of thinking about the future of finance and would like to talk very seriously about the merits of a combination. If, after serious consideration, it looks desirable, we would make a very specific offer."

Discussions were conducted during July and August by two teams of three: Paulson, Thain, and Thornton for Goldman Sachs and Warner, Walter Gubert, and Roberto Mendoza for Morgan. Others from both organizations joined in some of the division-by-division discussions. No numbers and no papers were exchanged. At Warner's insistence, it was agreed that poaching each other's employees was strictly forbidden. He worried that Goldman Sachs might pick off some of Morgan's best people and was particularly anxious to protect the bank's derivatives specialists.

Both groups had learned a lot about each other and their organizations' strategic fit. As Warner recalls, "The joint examination found—for both organizations—an even greater combined strength than had been expected or even imagined. Thain and Thornton seemed most keen, saying the combination was in their judgments a home run." To Warner, Goldman Sachs seemed

particularly interested in his bank's derivatives capabilities, its international stature with both corporations and governments, its great strength in Latin America, and its large, prestigious investment-management business. While Warner's team was hearing clearly the expressions of interest from Paulson's team, they should have been better tuned in to their reservations.

Looking back, the consensus at Goldman Sachs was that Warner was wrong to be his own expert adviser and to put all his cards on the table at the start of the negotiations. More specifically, Paulson's team was surprised to learn that J.P. Morgan was spending as much as Goldman Sachs in M&A and in securities dealing—both in bonds and in equities—but could not generate half as much in revenues. They were also concerned to learn how much of J.P. Morgan's business depended on derivatives and proprietary trading, and they were particularly concerned about having to go through large layoffs after a combination.

Both organizations had regular board of directors meetings scheduled for the same week, and that week was fast approaching, so if a deal was to be done, the time for decision was coming up soon. "It's time now to be specific," said Warner. Given what he felt was the strong business case for Goldman Sachs's acquiring J.P. Morgan, it was time to set a price. To represent full fair value for J.P. Morgan's shareholders, that price would have to be a premium over the current market price for Morgan shares.

While the two organizations were exploring each other as businesses, Paulson and Warner and the others were learning more about each other as people and as business leaders. Warner was particularly anxious to settle on the management roles. He called Paulson and asked if he could come over to Goldman Sachs's offices. There he proposed that he and Paulson become co-chairmen of the new company. Paulson wasn't ready to get specific about titles until a decision had been made on a combination, but he wanted to avoid any misunderstanding about the senior management structure. Acknowledging the possibility of becoming co-chairmen with Thain and Thornton as co-presidents, he was clear on one specific: "I'll be CEO." Warner replied, "I do know the difference between a merger and an acquisition." Paulson recalls, "Sandy understood that as CEO I would select the leadership team and said, 'Hopefully, you will pick some of our guys for your top team.' "

Then Warner asked, "Why not be co-nonexecutive chairmen? We do the deal and then appoint Thain and Thornton co-CEOs, to address all the tough

implementation issues and do all the reorganization work—work that will involve large redundancies in both organizations over three or four years of difficult integration." To make the acquisition work, there was sure to be lots of redundancy and many layoffs. For example, Goldman Sachs had 1,500 people in Tokyo and J.P. Morgan had 1,500 people in Tokyo.

Paulson brushed the proposal aside: "I'm not ready for that and our firm is not ready for that."

On Monday of the week when both organizations had board meetings, where presumably the combination would be ratified, Paulson told Warner, "I'm going to my apartment now—by myself—to give this whole proposition a deep think. Let me sleep on it and I'll call you in the morning."

Looking back years later, Paulson recalls, "I kept asking myself: In what business are they better than we are? In five years, where will they be stronger than we will be? At the very end—with board meetings coming up for both of us, I met early in the morning with Thain and Thornton and told them I had decided we were not going to do this deal—and hoped I wasn't disappointing them too much. Legally, we would be acquiring Morgan, but J.P. Morgan was so much bigger than Goldman Sachs that in reality *they* would be taking *us* over, and they would bury us. I also knew that somehow we'd figure out how to do everything they could do." Early that morning, Paulson called the members of Goldman Sachs's management committee and then all his directors. "There was no great push from our board. I had kept them close enough to my thinking all along so they would stick with me if I went either way on the decision."

At nine o'clock, Paulson called Warner. They had been planning to meet and discuss specific numbers so Warner was startled to hear, "Sandy, I've decided not to proceed. All I can tell you is that I went home to consider all our options and asked myself: Is this best for Goldman Sachs and what I really want to do? And the answer to that core question is no. And that's final." Paulson never called again.

Warner, in Paulson's view, could not have been more gracious as he thanked Paulson for calling. But after hanging up, Warner, who had been under increasing pressure from his board to do a deal, was understandably upset. He felt Paulson had never been serious and had just been asking all sorts of questions—"getting into bed for some sex with no intention of ever getting married." In frustration,

Warner protested, "At each stage along the way, their guys said the combination looked better and better and used terms like 'home run.' What has changed, for Christ's sake?"

The frustration Warner felt is still evident in his summation: "It's really something when one man takes something that important that far—with over a hundred people involved on each side—and then, overnight, decides 'No.'" The gulf between the two men spilled over into the press. A story appeared in the *Wall Street Journal* that Goldman Sachs had agreed to a merger and then reneged. Warner explains how that story originated: "Paulson had really spun it when he told the press that we went to them offering ourselves. This forced us to say something ourselves to set the record straight." Paulson denied this account: "Any leak came from J.P. Morgan and we responded."

Paulson was virtually alone when he made his decision, and he was profoundly alone when he told Thain and Thornton, "I hope I haven't disappointed you guys too much." Thain and Thornton, who had both favored doing the deal, each called their opposite numbers at J.P. Morgan to say they were surprised and that they would try to turn it around. But they couldn't change Paulson's decision.

Looking back, Paulson says, "Only a few people on the management committee were *not* bulls on J.P. Morgan." But as the years passed and J.P. Morgan merged into Chase Manhattan Bank, each observer, including Warner, came around to the conclusion that Paulson's decision had probably been right for Goldman Sachs. Balance-sheet assets, which would have been huge in a Goldman Sachs–Morgan merger, are a powerful store of value; they show the strength of past achievements and can be used to create new revenues and absorb risks and losses. But the real strength of a modern-day financial intermediary is not balance-sheet capital nearly so much as it is reliable, ready, large-volume access to the capital markets. And that depends on the creativity and connectedness of people with superior talent, drive, and strategic dynamism. These assets were far greater at Goldman Sachs and were increasing.

With the discipline and focus that Paulson had always lived by as a leader and talent finder, Goldman Sachs was almost certain to continue accumulating and compounding its competitive advantage. The firm's access to the open capital markets of the world meant that it could obtain assets and lay off risks at times

of its own choosing. It did not need to own huge balance-sheet assets because it could always find institutions that would rent them to the firm. Meanwhile, the firm's own comparative advantages—unusually talented, motivated individuals interconnected through shared values, teamwork, Whitehead's Principles, and the high financial rewards of effectiveness—would lift Goldman Sachs to higher and higher levels of power and profit. Even though many able people believed that merger was the right way to go at the time Paulson was making his crucial decision, these competitive strengths could have been overwhelmed and dissipated by a combination with a bank—even with the best big bank.

Pragmatic, hard working, disciplined, and determined, Hank "Hammer" Paulson had been formidable as a guard at Dartmouth, where he was ranked as one of the college's twenty-four all-time best football players *and* made Phi Beta Kappa. He was formidable in government service, working at the Pentagon under David Packard and in the Nixon White House as liaison to Treasury and Commerce; formidable as a business developer in Investment Banking Services at Goldman Sachs's important Chicago regional office, where he went after earning his MBA (with distinction) at Harvard Business School; and formidable in his pursuit of business in China and Japan and with every corporation on his domestic call list.

Investment bankers had traditionally been expected to focus their relationship calls on corporate treasurers and financial VPs, not chief executive officers or presidents, because Wall Street's principal function was raising capital, a specialized finance function. But when Paulson was getting started in the late seventies, the takeover boom was changing all that. Investment bankers were no longer just talking about money; they were now taking about a company's very survival—and the CEO's own career—with new services like tender defense. Suddenly, the established relationships based on standard financings were eclipsed by new, more strategic relationships with CEOs. As a new man with no prior relationships that he had to spend most of his time maintaining, Paulson could focus all his energy on developing long-term client relationships and on the best opportunities for significant new business. And so he did. Government service had given him confidence in dealing with very senior people like cabinet officers, and his

access to insider stories about the top people in government gave him a special advantage in his drive to link up with corporate CEOs. He made the most of his advantage, positioning himself as a confidant—not just another young investment banker—to CEOs at companies like Caterpillar, Kellogg, and Sears.

"Hank Paulson *is* tenacity," observes Lee Cooperman. Persistently forceful in expressing his ideas, Paulson was competitively aggressive without being abrasive. He regularly called client executives late at home and would go to the mat if he thought they were taking the wrong action in any deal. Similarly, says partner Peter Fahey, "He would not hesitate to block other firms if he thought something was 'not fair or not right for me and Goldman Sachs.' He's intensely competitive. Hank was a lot more than a bull in the china shop; he was a force of nature, very smart, and a huge producer."

Paulson's self-discipline served him well as a high-volume, high-value relationship banker. Still, it must have been surprising for client CEOs to be forced into a corner by Paulson's sincere, unrelenting logic as he worked to advocate a corporate action he knew was for the client company's own good. Over time, Paulson's persistence in doing what was right won him the respect and admiration of the Chicago business leadership, a group that prizes trustworthy directness and feels uncomfortable with the too-smooth ways it often associates with people from the coasts.

One of Paulson's great advantages in life is that he is always learning—partly through continuous observation of others, partly because he takes criticism easily with no defenses and no resistance, and never personally. A weakness is that he is almost oblivious to office politics and for years had to fight the urge to speak his mind immediately, without caution or consideration.

In developing relationships with client-company CEOs, Paulson was unconventional. He worked on nonbanking matters like the composition of boards of directors or investor relations—always looking for ways to demonstrate Goldman Sachs's value and win more business. Years later, Brian Griffiths, the Goldman Sachs international adviser who had been in Margaret Thatcher's cabinet and later became a lord, introduced Paulson to China's vice premier, Zhu Rhongji, and Paulson escorted Zhu to a rating-agency meeting after briefing him on how to respond to questions. After the meeting, the vice premier asked, "How did I do?" As always, Paulson was direct: "You did okay on the first and third questions but did not do well on three others." Chinese securities did not get the desired rating. Point made.

The Q&A was carefully rehearsed before they went back again—and got the rating they had hoped for. An important relationship was soon developing. In the firm's vernacular, Paulson was both highly professional and very commercial.

He made partner in 1982, and Steve Friedman appointed him and John Thain to co-head strategic planning for the banking division. As young, ambitious guys, their job was to think "new"—new markets, new services, and new ways of doing things on the simple theory that Goldman Sachs had "the attacker's advantage" versus Morgan Stanley and its traditional "white shoe" ways and established corporate clientele.

Paulson was a serious student of leaders, seeking to understand why some were so much more effective than others: "The more I observed the most effective leaders, the more I became convinced that the key is to have the right people in your own organization working for you and with you." Within Goldman Sachs, he soon earned a reputation for having the best people working with him to serve his clients, and for identifying outstanding talent early.

In 1990, Paulson chaired a firmwide strategic planning committee as John Weinberg was preparing to step down. Asked if he would become co-head of investment banking and go on the management committee, Paulson had serious doubts, because he didn't want to live in New York City. Steve Friedman quickly cut through that ambivalence: "Bob Hurst and Mike Overlock will be asked to be co-heads. We're offering you the opportunity to be the first co-head. Would you like to be working *for* them or *with* them?" Paulson quickly accepted and went on the management committee.

Starting with a suite in New York's Pierre Hotel that he used each week from Sunday to Thursday, Paulson began commuting and teleconferencing regularly from Chicago. (He eventually bought an apartment in Manhattan when he became COO and moved to New York.) Since Chicago was closer to Asia, he took Asia while Hurst took the Americas and Overlock took Europe. Paulson was soon making the first of what would accumulate to seventy-five trips to China. Goldman Sachs had only five people in Hong Kong when he started; five years later it had 1,500.

Day after day, Paulson took, as his first priority, completing whatever loomed

as the one most difficult or unpleasant task on his to-do list. And year after year his initiatives and discipline added strength and momentum to his career. "He has a bias for action," says Bob Steel. "You start by looking at what people want to accomplish, look for areas of agreement and then work toward achieving that." Armed with a few long-term principles—unrelenting client service and always asking for business, powerful work ethic, and a consistent commitment to identifying and developing future leaders—Paulson was free of prejudice or precommitments and open to finding the best way forward, which made it feasible for him to work effectively with many different people. Obviously sincere, he was seldom thought of as a pal, a charmer, or particularly charismatic. He was unconventional and unpolished. His clothes didn't fit well and his shirt tail was often hanging out, but he was connected with clients and built strong relationships. He gave unvarnished advice and was aggressive in getting the business.

Paulson found an ideal mentor in Jim Gorter, one of the firm's great relationship bankers and talent developers. When assigned to Chicago, Paulson was told, "Normally we don't assign men as young as you are to important client relationships, but you're bald enough to look older than you are so you'll be okay." Gorter took Paulson under his wing and counseled: "It's not how quickly you start completing transactions, but how well you do your work. Do everything the right way—always. Don't chase near-term transactions. Go long-term. Do it right and you'll get the really big business. Relationship banking is not a sprint; it's a marathon." Gorter taught Paulson a great lesson: "Secure people give all the credit they can to the other people on the team." The strength of this advice was amplified for Paulson by comparison to partners who took credit—sometimes more than they deserved—and seriously hurt their careers over the longer term.

Gorter would continue to counsel Paulson even when Paulson was CEO and Gorter had retired. Gorter would modestly say, "Of course, I'm no longer directly involved and can't be sure, but my instinct would be . . ." and then go on to give his wise advice. He gave Paulson the benefit of the best detailed thinking of a shrewd "firm patriot" who spoke in private and with candor.

Paulson also got advice from Steve Friedman on organizational and strategic decisions, particularly the buildup of principal investing. Eventually, despite the strong feelings Weinberg and others still held, Paulson would bring Friedman onto the board of directors.

. . .

Paulson and the mergers group believed the firm's "no hostiles" policy tradition was holding Goldman Sachs back from lucrative business it could easily have had by advising large, ambitious, serial-aggressor corporations on takeovers. They believed the traditional policy did not reflect developments in global capital markets and that it had been designed for a clientele of smaller companies that were likely targets. In another of their personal policy clashes, Corzine had opposed any change that conflicted with the firm's "good guy" image as corporate management's most reliable friend. Paulson was determined to move ahead and said that what he called the "PR factor" was being way overblown. As a compromise, it was agreed to conduct an experiment. The firm *would* advise on a hostile takeover on two conditions: the experiment would be conducted outside the United States and would not involve any U.S. corporations; and, to be certain the payoff would be worth the reputation risk, the deal *and* the fee must be really big. As always, the quality of the client company, the probability of success, and the competition would also be criteria.

The chosen deal was Krupp's 1997 hostile acquisition of Thyssen—a multibillion-dollar deal in terms of market capitalization that would produce nearly $10 million in fees to Goldman Sachs. While some clients "wondered," the overall reaction was neutral in the European corporate community; there was little or no surprise because "everybody did it." In the long run, Krupp's move was truly brilliant. It originated with Ulrich Middelmann, who was then in charge of corporate strategy at Krupp and is now vice chairman. Middelmann recognized that Krupp's prospects were declining and would continue to decline unless a major change was made—and that merger with Thyssen would bring the combination up to a scale of operation that would create a durable giant.

Paulson and others at Goldman Sachs saw this as an unusual and compelling opportunity. Germany was both a strategic priority for the firm and a difficult market to break into. This takeover would give Goldman Sachs an opportunity to outflank the dominant national competitor in Germany: Deutsche Bank.

With detailed advice from Goldman Sachs, Krupp's execution of the surprise attack was timed perfectly. In Germany, Easter weekend is a four-day tradition that includes both Good Friday and Easter Monday as holidays. Most senior

executives make this weekend a special event for their families by leaving instructions not to bother them with calls, and many travel considerable distances to one or another of Germany's numerous resorts—usually departing early Thursday afternoon. Their assistants "disappear" with their families too. So by announcing the tender offer late that Thursday afternoon, Krupp caught Thyssen completely unprepared. And for four straight days, Thyssen executives, widely dispersed to "unknown" locations and with no assistants on duty at headquarters, were unable to contact or communicate effectively with one another.

Blitzkrieg! No defense was possible to organize until well after all the newspapers, magazines, broadcasters, and financial news services had reported the story just the way Krupp wanted it defined. For a firm so long identified with being on the defensive, Goldman Sachs's performance on the attack was remarkable—and Paulson's point proven.

After Paulson took over as sole CEO, the process of completing Goldman Sachs's IPO was, after all the angst and anticipation that had built up, almost routine. Corzine performed his role as chairman with dignity and discipline. The roadshows were well organized and the reception constructive. Analysts did have various concerns. They worried about the disruption of changing from partnership compensation to corporate salaries and stock options. They worried about a diaspora of "IPO partners" once partners had completed three more years' service to achieve full vesting; analysts noted that the *average* partner would be worth $66 million—or, assuming an early run-up in share price, even more—and they doubted many would stay and continue to shoulder the burdens of working long, intense hours. Given the larger role of trading in its profit mix, the main and most persistent rap on Goldman Sachs was that it was really a giant hedge fund with a sideline in investment banking. The firm resisted this summary at first. But the comparisons to other investment banks were incontrovertible, and it wisely changed from rebuttal to a much more credible proposition: if you're looking for smooth earnings growth, you'll want other firms; our earnings will be more lumpy and less predictable because our focus will always be on long-term earnings growth. This more realistic positioning was well received.

The IPO succeeded brilliantly, raising $3.6 billion, making it the second-

largest ever and creating more centimillionaires than any other.[1] On the first day, Goldman Sachs's newly public shares zoomed from $53 to $76 a share before closing the day at 70 ⅜. Best of all from the standpoint of Paulson and his colleagues, it left the partners and the management committee still in charge: 87.4 percent of the stock stayed in the hands of partners, retired partners, other Goldman Sachs employees, Sumitomo, and the Bishop Estate organization.[2] In spirit, the partnership persisted.

The concept of leadership at Goldman Sachs has changed completely over the past fifty years. Sidney Weinberg was a leader, but in many ways his firm was a proprietorship. While Gus Levy insistently expected many people to do all they could to build the business, there was no question that he was *the* leader—in overall pace and direction and on dozens of transactions every day. Whitehead and Weinberg pushed decision responsibility and accountability out to the unit heads. Rubin and Friedman matched even more widely distributed authority and responsibility with centralized accountability to the management committee. Paulson continued the multiplication of decision-making leaders and increased the coordination of operating units through centralized disciplines: risk controls, business planning, and performance measurement at increasing numbers of smaller and smaller, more agile units that were closer to particular markets.

"When I joined Goldman Sachs's senior management team," says Paulson, "John Whitehead told me that the most important thing we did as senior management was recruiting. If we had high-quality people, then all that senior management needed to do was figure out the firm's strategy and put dollars behind resources appropriately."

The number of leaders needed rose by a factor of ten in the years between Sidney Weinberg and the Two Johns; then by another factor of ten under Rubin and Friedman; and on upward by yet another factor of ten under Corzine and Paulson as the firm and its business became increasingly competitive and specialized. The firm had grown from 300 to 30,000, and the need for leadership had grown even more rapidly with the distribution of authority that comes with rapidly advancing technology, multiplying geographic and customer market segmentation, increasing competition, and the firm's own intensifying determination to prevail.

Paulson emphasizes the lessons learned from his observations of successful leaders. "The things that make a good leader are being open-minded, having a willingness to really ask for and accept advice, showing a sense of humility—and putting the right people in the right seats." He developed considerable confidence in his ability to evaluate people and match them with the responsibilities best suited to their development. "Business failures are always linked to people failures. I work hard to find outstanding people and try to match them with a job where they can succeed. Often, I'll say to them—and they always appreciate the candor—'I'm not sure you're in the right job for you. Let's repot you and see how you do.' "

Paulson stressed the importance of leadership. Everyone, no matter how junior, was expected to lead. As Paulson put it, "We're global and multicultural like other professional service firms, but we also have huge capital commitments and risks to manage. It takes many, many leaders. Goldman Sachs is leaders working with leaders." The firm had become too large and diverse, markets were changing too much and too fast, and consistently skillful leadership at all levels was too important to depend on the firm's traditional apprentice process to learning and development. In 1999, urged on by John Thornton and John Thain, Paulson appointed a development advisory committee to assess the firm's needs for a more systematic approach to developing the leadership effectiveness of its more than 1,000 managing directors.

Over six months, the committee gathered data in different ways. Internet surveys and interviews sought opinions within the firm on management and leadership development: how much was going on, how effective was it, and were the firm's changing needs being met? "Best practitioners" were visited around the world to study what they did and how well it worked. Finally, experts and consultants were interviewed to learn about the latest concepts in management development. During its study, the committee grew increasingly concerned about the need for many more well-developed leader-managers as a result of the firm's increasing complexity and global size. Each division was as large as the whole firm had been just ten years before.

Pine Street, as the program would be called, expanded its focus to include what was identified as "leadership acceleration" for a group of nearly 100 fast-rising VPs. The message was the same message the Two Johns had given new partners thirty years ago: Congratulations on your well-deserved promotion. We expect even more of you now, so take the pace up even higher and be a real leader.

Formal training was a foreign concept for Goldman Sachs. The firm had traditionally relied on one-on-one coaching. The committee recognized a major problem: the firm's culture, work ethic, and reward system were notoriously commercial, so something as soft and abstract as a program of management development would be consistently overshadowed by real transactions, particularly when the program was new and unproven. Leadership for the new leadership program would be crucial. Who better than Steven Kerr, the head of GE's fabled Crotonville leadership-development center? Thain and Thornton courted him for nearly a year, and he joined in March 2001. Even before officially arriving and even though somewhat mystified by the time and effort being invested in developing the program, he was soon joining in 6 a.m. planning sessions.

Bob Steel offered an explanation: "We talk about Goldman Sachs being a culture, but let's face it, it's also an economic relationship that we have. If Goldman Sachs doesn't earn any money, we're not going to end the day singing songs around the campfire and come back the next day with a warm glow. In the end, people need to believe that this training will help them do better at the firm and with their career or as individuals. They have to believe that. It's got to be about doing better at your job and being recognized as being better." To ensure the program would be embedded and accepted as an integral part of Goldman Sachs, a separate campus was rejected in favor of conducting all Pine Street activities in the firm's regular facilities and engaging firm leaders with strong internal credibility and strong connections to the firm's business success.

In 2005, the firm introduced small-unit workshops for two to twenty people at a time. Topics included how to jump-start your leadership in a new business, pragmatic guidelines on vision and strategy development to make a business unit more effective, how to convert vision and strategy into action steps, individual roles and specific task responsibilities, and how to resolve process or people problems that might limit business performance.

Paulson always was serious: serious about discipline, serious about getting business, serious about serving clients unusually well and developing people and making decisions—so consistently serious that it must have been a bit much for others. His partners did not resist teasing him or giving him a hard

time—particularly if they thought he was encroaching on their territory and responsibilities, which they were not about to concede. In his early years as COO, Paulson wanted to examine the profitability of the firm's stockbrokerage business in London, so he called for a meeting with the co-heads of that business, partners Wiet Pot and Pat Ward. Paulson, who had a reputation as a commanding leader who liked to take charge of a meeting, had signaled ahead that he was dissatisfied with London's profitability. Pot and Ward had zero interest in being raked over the coals, so they agreed in advance to seize the initiative and ask Paulson all the questions—partly for fun and partly to control the session. Pot, a tough Dutch Catholic who is never intimidated, began asking questions right away to put Paulson on the defensive: "Why did you call this meeting?"

"I wanted to know how you are managing this particular business."

"I see, you had some sort of concern, perhaps a real worry. Okay, what exactly concerns you?" Paulson, who had expected to be asking the questions, was caught off guard. His first response was a bit uncertain. Pot quickly poured it on: "Which business is larger in London, Hank, equities or Private Client Services?"

"I'm not sure."

"You're not sure. Okay, how big are we taken together as a business?"

"I don't have an exact revenue number."

"So you don't know the revenues. Okay, how many analysts, traders, or salesmen do we have?"

The barrage of questions kept coming and coming at Paulson until Pot paused to say. "So, let me summarize. As the firm's COO, you've called a meeting—apparently because someone whispered to you that we may have a problem—but you don't know the size and mix of our business, our revenues versus competitors' revenues, the number of our people, or any other particular about our competitive situation or even why we run our business the way we do. So in brief you've called a meeting for which you are not prepared." Paulson retreated. He took it as a lesson learned and never again had a similar challenge in a meeting.

Goldman Sachs was looking for acquisitions that could give it strategic balance by adding strength among retail investors to its traditional strengths in the wholesale or institutional markets. Morgan Stanley had merged with

Dean Witter, and Merrill Lynch, the firm's other major competitor for corporate and institutional business, had, of course, built its strength in retail and then expanded into the corporate and institutional markets. Lehman Brothers, having acquired Shearson's retail system, was gaining strength and momentum. Acquiring Charles Schwab, advocated by John Thain and John Thornton as one way to gain access to the retail market, was seriously considered.

Aiming to increase its access to order flow and to get closer to the center of "price discovery" (finding the price that clears the market by balancing supply and demand), the firm in 2000 paid $6.5 billion—$4.4 billion in stock and $2.1 billion in cash—to acquire Spear Leeds & Kellogg, a large NYSE specialist firm, and agreed to set aside another $900 million to help retain Spear Leeds employees. Paulson was clearly the driving force in executing the decision and made several persuasive calls to key people in support of the equities division's strategy. That division had been struggling with weak profits and feared not having retail business would put it at a serious strategic disadvantage versus competition. He thought Spear Leeds was a close cultural fit with Goldman Sachs. Others worried that it had a history of securities violations, including a 1998 NASD fine of $950,000 for intentionally delaying reports of trades to get a profitable competitive advantage. Spear Leeds had responded that it was "not surprising that we have fallen short of perfection" given its trading volume. Paulson insisted at the time of the acquisition, "We feel very comfortable with their people and their standards."[3]

Within Goldman Sachs, views on the acquisition differed strongly. Skeptics argued that at $6.5 billion, it was far too expensive, that the specialist business was yesterday's business and sure to be headed for disruptive change, and that the two cultures were not complementary. Advocates saw the acquisition as a way to get closer to retail order flow, which was important to underwriting in the new dot-com era. Today the consensus would confirm that acquiring Spear Leeds was strategically wrong and not a good deal.

Spear Leeds & Kellogg had three different businesses. It was the largest specialist on the New York and American Stock Exchanges; it did a major clearing business, processing transactions for local brokers around the country; and it made markets in over 3,000 stocks on NASDAQ—which compared to just 380 stocks for Goldman Sachs. Spear Leeds served 20,000 accounts[4] so there were

possibilities of cross-selling Goldman Sachs's services to those accounts. There were clear pluses and minuses to the transaction.

As Paulson said, "We were concerned that we didn't have access to retail business and retail distribution. This transaction was important to our people in the equities business. In a time of fast change, we wanted to expand our strategic options." The problem was that Goldman Sachs bought Spear Leeds before it had a clear understanding of the direction the market was moving in. The structure of the equity markets was in a state of flux and uncertainty. Spreads were under pressure.

Looking back, Paulson takes a rather optimistic view even while recognizing that the acquisition tarnished the firm's reputation: "While the specialist business deteriorated more quickly than we anticipated and the NASDAQ or over-the-counter business was very disappointing, we got a great technological trading platform in the clearing business that has worked out well and is today the backbone of one of the largest electronic trading networks in the world. So while that acquisition didn't enhance our reputation, net-net, it was probably okay." Others would be less sanguine. Some have groused about "vaporizing several billion." Whatever its merits in the clearing business, Spear Leeds executives were surprised to learn how badly inferior their technology for risk control was to what Goldman Sachs already had. Some called the acquisition the revenge of the dummies.

A sharper blow to the firm's reputation came from the IPO market. In 1999 and the first half of 2000, as the dot-com bubble market was peaking, Goldman Sachs had been the leading underwriter, with fifty-six new issues. However, this was no triumph in quality: 40 percent of those issues fell from their offering price, including Flowers .com, which came out at $21 and fell below $5, and PlanetRX.com, which fell from its $16 offering price to less than $4. Even excluding "e-tailers," 42 percent of the firm's Internet IPOs were down from their IPO prices, versus only 11 percent for rival Morgan Stanley.[5] Goldman Sachs and other firms were subsequently found guilty in federal court of breaking the industry's accepted rules of conduct and the securities laws in the notorious "analysts case." In what became known as the "global settlement," Goldman Sachs paid out $150 million.

Paulson led a major repositioning of Goldman Sachs's strategy and its franchise in the world's financial markets. The conceptual frame for this change

traced back to the problems—and what was hidden by the problems—of Goldman Sachs's Water Street "vulture" fund. By the time the Water Street Recovery Fund was shut down, Paulson, Friedman, and Peter Sacerdote had become convinced that private-equity investing could have major attractions for Goldman Sachs. If properly designed and managed, it could fit strategically with the firm's commitment to agency corporate relationships.

Paulson was determined to establish a major business for Goldman Sachs in private equity and real estate—not as an agent, but as a principal investor. While Morgan Stanley separated its principal business geographically as its way of solving the problem of conflicts of interest, Paulson rejected that sort of action: "You could locate principal investing at the South Pole, but if you do something wrong or if an action is perceived as a conflict, that will hurt you with the same clients just as much."

During an era in which other banking firms were dropping out of private-equity investing and saying, "We don't want to compete with our clients," Paulson went the other way. Typical of his direct style and thoroughness, he visited with every significant private-equity firm and made his case: "We'll be smarter, better bankers and more effective in our work with you if we do this and gain the experience. We are going to do both principal investing for our own account—often, we hope co-investing with you as partners—and, as advisers, helping you accomplish your objectives. We believe we know how to manage the differences and avoid direct conflicts of interest. We want you to understand and certainly hope you will understand that from time to time, we are going to be investing for our own account, regularly and in size." There was no need to say that Goldman Sachs would not be asking for permission.

Paulson's drive met resistance within Goldman Sachs as well as outside. Senior Goldman Sachs people—particularly partners who had gone limited—would go to Paulson and say, "Hank, you're destroying the culture of Goldman Sachs," and follow on with an explanation like, "We cannot compete with our clients!" Paulson wasn't buying it. "What they really mean is that they don't know how or are unwilling to adapt to change. The facts are that our clients' expectations for capital commitments and sharing the risks are forcing us to be principals. The business is changing because our clients want us to change. If you don't or won't change, you *will* wind up with less than the best strategies, practices, and

plans. The market—the world—does change, and as intermediaries, we must change."

Paulson—with help from John McNulty, Peter Sacerdote, and other partners—moved the firm to a new strategic proposition: it was committed to being both explicitly principal *and* agent. No longer could or should clients expect the firm to be just an agent or expect it to subordinate its interests in the principal investments it might make on its own account with its own capital, expertise, and access to information. If the firm had a client relationship, the people working for that client or that assignment would, of course, strive mightily to do all they could properly do to excel in completing that mission, including committing capital as a principal. But Goldman Sachs would also be working just as hard and just as cleverly and imaginatively for its own account.

"I saw that if we, as always, managed business selection and conflicts effectively and avoided direct conflicts, we could do both investment banking and principal investing," says Paulson. "If you deal openly with clients, this should serve all interests well and make us a stronger, more experienced firm able to do even better for clients in the future." Goldman Sachs leadership would be responsible for managing the differences so they would not be—and would not be seen to be—in conflict. Of course, a major challenge with such a position is that Goldman Sachs was holding itself responsible for deciding what was right and how others should perceive the firm's decisions, policies, and practices.

The change in strategic positioning would involve educating clients about the meaning of being a client. After Goldman Sachs invested—entirely for its own account—in Sumitomo Bank via a 4 percent convertible preferred bond with twenty years to maturity at a large conversion discount, the firm offered Singapore's Government Investment Corporation, one of the world's largest and most sophisticated investors, an opportunity to invest in a very different preferred issue: a 2 percent convertible with only two years of convertibility offered at a slight premium. The senior investment officer, Ng Kok Song, called John Thain to protest: "Is this the way you want to treat an important client?"

"You were offered what the firm is offering. If you don't wish to participate in this deal, that will, of course, be entirely your decision. Our responsibility is to offer you the same terms we offer all other major clients. What the firm does

for its own account is separate." Goldman Sachs was redefining its role in a client relationship and redefining the role of a major client.

"Full disclosure of your strategy and your objectives—in advance—so clients know what they can or should expect is vitally important," says Paulson. "No surprises: full disclosure and full discussability. The firm's strategy must include not putting client X in harm's way. This is a lot easier to describe in general terms than to execute in specific situations. Co-heads and tri-heads [of business units] really help with decision complexities by providing a different perspective or opinion."

Paulson had been a believer in technology and its impact on the securities business since the seventies, when he first saw continuously updated bond prices displayed on a computer screen at a client's office. Goldman Sachs was certainly no technology leader in the early years. Senior management got its first briefing on the impact of the Internet in 1996, including answers to the basic question: What is the Internet?

That changed a lot. Paulson believed the firm was in a race to exploit the revolution in digital technology. "For people who can embrace change, there's great opportunity to grow. Others soon just won't be here." After the firm spent $5 billion in five years, by the middle of this decade proprietary trading algorithms handled twenty thousand derivative trades a day and 70 percent of the firm's Treasury bond trades—updating prices two hundred times a second and executing all trades up to $100 million automatically.

"The best protection is to continually reinvent ourselves so someone else doesn't do it to us," Paulson said. "What keeps me up at night isn't what our traditional competitors are doing, but that someone we didn't foresee will use technology to emerge as a significant rival." Paulson's strategy was to cover all the bases, enabling the firm to keep in close touch with changing technology and able to move quickly in any direction as developments clarified. "We have two dozen electronic trading ventures going on, and they're a sideshow compared to what we're doing in-house." Hull Group, for example, which traded derivatives through complex quantitative pricing models and algorithms, was acquired for $550 million and promptly expanded into equity-options trading. The greater the market volatility, the more Hull's trading speed and precise pricing increased

profitability and market share. In Tokyo, Hull's know-how resulted in its controlling nearly half of all options trading.

Paulson pursued the same general goals through difficult times as a director of the New York Stock Exchange. In 2003, he was told by the exchange's CEO, Richard Grasso, "My compensation package is not on the agenda," so Paulson felt no need to change his plan to go birding in Argentina and missed the crucial meeting on Grasso's outsize compensation package. "He lied to you, Hank," advised an experienced senior colleague, "so you can and should resign with a clear conscience." But others insisted he should stay: It was his public responsibility. So Paulson, at considerable cost to himself, stayed on and worked through the problems. It was good for the exchange that he did stay. Over the next few years, the old, obsolete business model of the NYSE was revolutionized with the central limit order book, which consolidated limit orders received from all sources, and the merger with the Archipelago electronic stock exchange, which transformed operations and produced major gains in valuation for both sides.

Paulson's decision not to combine with a major bank left him with a major unanswered question: How would Goldman Sachs compete with the world's leading "universal" banks? All the universal banks were pushing their way into investment banking by lending capital. They were substantially increasing their lending capacity by syndicating term loans, but their main competitive weapons were speed to commitment, flexibility on terms that they could custom-tailor to the specific borrower, and price. If those who had advocated Goldman Sachs's combining with a big bank had foreseen these developments, they would have insisted on a merger.

In 2002, Paulson found an opportunity to obtain comparable capacity to provide capital without having to absorb a large commercial bank. The opportunity came from the firm's big friend in Japan: Sumitomo. Sumitomo had merged with Mitsui and was once again determined to expand, particularly in America. Paulson worked out an agreement in which Goldman Sachs made a substantial investment in the bank, and Sumitomo-Mitsui would provide a backup guarantee behind commercial paper issued by Goldman Sachs. With this innovation, the firm could deliver low-cost credit quickly and in large amounts—up to $1 billion—through an entity called William Street. Now Paulson had an enormous balance sheet that

Goldman Sachs could call on at any time. This arrangement also offered a major opportunity to develop investment banking business in Japan.

Around this time, Paulson gave one of his most important speeches as CEO. At the National Press Club, he discussed the state of corporate America and the lessons learned from the breakdown in financial reporting and corporate ethics and the resulting scandals involving Enron, WorldCom, and others. In a highly charged environment and against the counsel of some in the firm, Paulson laid out a comprehensive examination of accounting, corporate governance, and ethical issues that had coalesced to cause a crisis of confidence. "In my lifetime, American business has never been under such scrutiny. To be blunt, much of it is deserved." He went on to say, "I see this as an opportunity to reassess our practices, renew our principles, and rebuild the trust that is so fundamental to our markets and their vitality."

Initial reactions from some corporate executives caused Paulson to worry that he may have made a mistake to speak out so forcefully, but he was soon getting a broad and strong positive response. Senator Paul Sarbanes credited Paulson's statements with playing a key role in getting support for the Sarbanes-Oxley reform legislation.

As Enron, WorldCom, and the Wall Street research settlement began to fade in the public's eye, Paulson still wrestled with his disappointment that he and the firm hadn't done enough to positively differentiate Goldman Sachs during the bubble. What ensued was a year-long program called the chairman's forum, embodying Paulson's determination to get all the managing directors to show strong leadership and be personally accountable for good business judgment and advancing the firm's reputation. Paulson's personal engagement was typical of his discipline and commitment: During the first six months of 2005, he spoke at twenty-six chairman's-forum sessions around the world. Paulson maintained that the firm had not been truly distinguished in its own behavior, as it should have been, and led each group in discussion of what should be done.

Ego management has been a continuing priority at Goldman Sachs since the days of Sidney Weinberg's saying to those he thought prideful, "You're so

smart . . .” and proffering another Phi Beta Kappa pin from his collection. Later John Weinberg admonished colleagues: “Clients are simply in your custody. Somebody before you established the relationships, and somebody after you will carry them on.”

If someone new to the firm says “I just did so and so,” a partner will say, “Excuse me*?*”

“I just did a big trade,” the newcomer repeats.

“Stop. Wrong pronoun. *We* just did a big trade. Try again.”

As Bob Steel explains, “First-person singular is only used to describe a mistake, not an accomplishment. It may sound silly but little things like that are quite significant. I’ve never heard a boss at Goldman Sachs say, ‘I just did this.’ If I ever did, I’d be embarrassed.”

Paulson remembers getting his first Goldman Sachs memo back from Jim Gorter. “Good memo!” was written at the top—and every “I” was crossed out in favor of “we.”

The most visible test of Paulson’s capability in matching people and positions—a capability that was certain to be watched closely by his board of directors—was in establishing his senior leadership team and his successors. He had become CEO with the explicit objective of stabilizing the firm’s senior management.

Paulson had come to the top job with the support of his chosen co-COOs, Thain and Thornton, and an understanding among them that he would serve only two years. They had worked well together in the early years. But now he was having second thoughts on how long he should stay—and on his successors, which added to the question of his own appropriate tenure. Some partners did not react well to Thornton and Thain as co-COOs, feeling that they projected a sense of entitlement. John McNulty captured the problem that Thain and Thornton were developing for themselves: “They act like the owner’s sons!” At the same time, Paulson came to the conclusion that he should stay: “I was naïve to think I could do my part in only two years. And I couldn’t leave once we decided on the IPO.”

Doubts were spreading about Thornton’s becoming CEO. He was recog-

nized as one of the most creative strategists and relationship builders the firm had ever had. As one partner summarizes, however, "Great charm and amazing macro-vision, he was superb on the big picture, but he had no long-lived or deep friendships with other partners. When he was co-COO, he didn't do the work. After he and Thain carved up the world and divided up the business units of the firm, Thornton seemed to lose interest and just didn't go to some of the areas he was responsible for. Just didn't go. Period." While some felt he might have been a great nonexecutive chairman, he didn't show the necessary interest in the nuts and bolts of implementation, control of costs, or organizational discipline.

Thornton would have picked up signals of a change in Paulson's feelings toward him as a co-successor and knew he had generated resentments within the firm. His ability to conceptualize remarkable strategies for the firm or for clients could be applied, of course, to his own career. Recognizing that Paulson was increasingly thinking of staying on, he asked only, "Stay if that's what you'd like to do, Hank, but please tell us so we can make our own plans." As Paulson gradually extended his estimated term and then stopped talking about leaving, Thornton did not wait. He had "conversations" with a few major U.S. companies about becoming CEO and continued to build up his personal franchise in China, where he had been rapidly expanding the firm's investment banking business.

For Paulson, as CEO, it would have been troublesome to have chosen a successor who did not give priority attention to careful implementation. He may also have been concerned that Thornton's brilliant conceptualizing and articulating could someday surprise him with the sort of surprise that had stunned Corzine in the management committee. Whatever the reason, Paulson told Thornton he would be staying. This began the conversation that led to the announcement that Thornton would be leaving. Paulson called directors one at a time to inform them and be sure they were comfortable with his thinking. John Browne of BP saw right away that Thornton was going down and couldn't be saved, so he stood back and let him go—but a year later, got him a seat on the board of directors at Intel.

Thornton would see the process of separation quite differently. Academic institutions are considered more central and prestigious in China than in America, so close observers may not have been surprised, at least in retrospect, to learn that Thornton accepted an appointment as a professor at Tsinghua University's business school, where he would teach an advanced course on leadership. What

few would have known or appreciated was the importance attached to such an appointment by the Chinese government. Full professors must be endorsed by the State Council, a process closer to the way federal judges are confirmed in America. It takes time: at least six months. And Thornton would be the first non-Chinese elevated to such stature. The result was that while Paulson came to the conclusion that he would stay and lose Thornton in January—announcing it in March, with an effective date in July 2003—that separation process had already been quietly initiated by Thornton the previous October.

After leaving, Thornton had dinner with Thain and advised him to give fresh consideration to the situation, particularly if Lloyd Blankfein were advanced to equal status. While Thain had been working almost exclusively on internal operations and organization, Blankfein had been accumulating the power of profits. Starting with J. Aron, which had expanded boldly in oil trading and foreign exchange, he had then taken over and integrated fixed income and then added equities. His units now accounted for 80 percent of the profits of Goldman Sachs, and historically he who controlled the profits controlled the firm. Blankfein was increasingly popular—and he was smart. He and Thornton were not close.

Paulson had a plan. With Thornton out, he would appoint Blankfein, already a member of the board of directors, to be co-COO. Paulson recalls that when they worked together in 1994 on the operations committee, "I saw that Lloyd had great ability." Late on a December morning of 2003, Paulson completed the changes that he had planned so carefully and, as always on organizational matters, had talked over with his board of directors.

Paulson had discussed the co-presidency with Thain for several weeks, but Thain had been vigorously resisting that approach. That may be why Paulson decided to ask Thain to co-sign the memo to the firm announcing that Blankfein would be elevated to co-president. Paulson may have thought he had evidence that Thain would see that his best decision would be to stay, accept reality, and adapt—and continue earning large rewards in his already remarkable career. Realistically, he would have no comparably appealing alternatives.

But Thain did have an alternative. He knew John Reed from their service together on the MIT Corporation, equivalent to its board of trustees. Thain had been approached by Reed to be the new "reform" head of the New York Stock Exchange. Major changes at the NYSE were certain and they played to Thain's strengths. The

public-service integrity of the exchange had been severely questioned when Richard Grasso's prodigious compensation package became public, and the NYSE was falling behind in two major areas—automation and globalization—that were areas of strength for Thain. In addition, Thain felt more than ready to be a CEO and had always had a Boy Scout's instinct for public service. Thain and Reed had been having serious and advanced discussions, and Reed was ready to make a formal offer. So shortly after his heads-up, Thain closed his door, picked up his phone, and called Reed to say: "The mission at the exchange is right for me and the timing is good. If you can make a definitive offer now, we have an agreement."

Reed could and within hours did. Thain went to tell Paulson. Paulson knew Thain well enough to know he had no chance of getting him to change his mind—so he didn't try. Quickly recovering from the surprise, he took the line he would continue with: great pride that another leader from Goldman Sachs was responding to a major public need.

With all the changes, a casual observer could have seen the realities this way: Paulson picked Thornton and he's gone. He picked Thain and he's gone. Paulson won't want to lose any more carefully considered and carefully selected key lieutenants. He won't want to lose Blankfein. But Blankfein understood that only so long as he kept Paulson's confidence did he have leeway to continue making changes. Despite some initial disagreements, senior positions at the firm were soon filled by people both men wanted. Operationally, Goldman Sachs was becoming Lloyd Blankfein's firm, but Blankfein knew he would have to measure up. Paulson had already proved he was ready to make tough decisions—including decisions on management succession.

With Blankfein on the board and installed as COO, Paulson had his succession in place. He and his board had rigorously reviewed each of the firm's twenty-five top leaders and agreed on how and why each senior seat would be filled. He was confident that Blankfein would prove that he could handle being CEO of a very complicated but now publicly owned, globalized, and stabilized Goldman Sachs. And as the environment changed, he believed Blankfein would be able to adapt well. As Paulson expressed it, "People knock Lloyd, saying he's a chameleon—always changing his color. But they might instead consider giving him credit for learning and growing. Lloyd is a unique talent. For a dozen years, I've watched him develop as a leader."

. . .

In May 2006, Henry M. Paulson got a call, not the first, from the White House to discuss his becoming Secretary of the Treasury. He told partners he wasn't going to take the job, and John Whitehead advised against considering it: "This is a failed administration. You'll have a hard time getting anything accomplished."

On Saturday, May 20, Paulson met more than once with White House chief of staff Josh Bolten—who had worked at Goldman Sachs—to discuss the basis upon which Paulson would agree to serve.[6] Bolten had begun the conversation: "Let's discuss for a few minutes what you would want to know this job was going to be—on the hypothetical assumption that you had accepted because those understandings were the way you wanted to work." The two men worked out an e-mail memorandum of understandings that would include "regular, direct access to the president; equal stature with Defense and State; principal spokesman on all economic and fiscal policies—even those not normally reporting to Treasury; chair the economic policy luncheons in the White House, and ability to choose his own staff." With that understanding, Paulson went into a meeting with the president.

Their conversation centered on family—Paulson's family and Bush's family—and on other personal matters before turning to what Paulson calls "philosophies and objectives" and agreement on having regular, direct access, chairing the weekly policy luncheon, and being spokesman for the administration on all fiscal matters. As the conversation continued into its next hour, the president invited Paulson to join the cabinet. Knowing that "no agreement means anything unless real trust is earned," Paulson would sleep on it. Next morning, he called to accept.

Paulson's priorities when he became CEO eight years before had been to effect a smooth transition from private to public ownership with the completion of the long-anticipated IPO, to operate Goldman Sachs as a disciplined public company with an effective board of directors, to build the international business, particularly in China, to expand GSAM and private-equity investing substantially, to develop capable leadership succession, and to position the firm's overall strategy so its evolving policies and objectives would be understood and well accepted. When he left, Goldman Sachs was recognized as the premier "solutions provider." It had the best working relationships with the largest number of major

corporations, governments, institutional investors, banks and private-equity investors; the best knowledge and understanding of companies, industries, economies, and markets; the largest appetite and capacity for taking risks of all sorts, with the ability to commit substantial capital; the strongest recruiting program; the highest compensation—and a well-accepted overall strategy for the future. Paulson had led the transformation of Goldman Sachs, and the experience in leadership had equally transformed him.

"The ultimate test of a CEO," Paulson says, "is that he worries about being sure no bad things happen, that he leaves the outfit in better shape and with a smooth leadership succession. I believe I left Goldman Sachs in materially better shape than it was in when I became CEO, both internally and externally." Even better, his colleagues at Goldman Sachs and his customers and competitors would agree.

While it would not have changed his decision to serve his nation and risk his reputation by joining the Bush administration, the irony, as some saw it, was that the financial benefit to Paulson of accepting the call of duty is surely greater than that enjoyed by any other public servant in U.S. history. Goldman Sachs has long had a policy that all deferred compensation becomes payable promptly to any partner who accepts a senior position in the federal government. Congress passed a law a quarter-century ago that people taking senior appointed federal positions who convert their investments into either an index fund or a blind trust can do so upon assuming office with zero taxable capital gain until such investments are later sold. If Paulson took advantage of these provisions, they enabled him to sell his shares in Goldman Sachs without raising any public questions and without tax and to diversify his large personal investments in a single stroke. For just over two years' service, the savings in Paulson's personal income taxes could have been as large as $200 million. Paulson had no interest in diversifying his investments and had never sold a share of Goldman Sachs stock. So these "benefits" were purely hypothetical.

There's another large irony. Paulson, who had encouraged others to diversify and stay at the firm, had never previously sold a share of Goldman Sachs stock. He sold his shares at $150, a price he believed deeply—and accurately—was low because 2006 was a very strong year, and he estimates that the timing of the sale cost him $200 million. He also had to liquidate his large private-equity

holdings—including a substantial position in the Industrial and Commercial Bank of China, which has since multiplied fourfold. The tax break was no great boon to Paulson: He plans to give most of his wealth to his charitable foundation.

Philanthropy and public service are more important to Goldman Sachs people—particularly its alumni—than to any comparable group. This makes sense because they earn substantial wealth and have been beneficiaries of cultural, educational, and medical institutions. Still, it is impressive to recognize that no other organization spawns so many trustees of colleges and universities, art museums, foundations, libraries, and hospitals. At Goldman Sachs, service and serious giving are expected, and leaders are expected to set the pace.

36

LLOYD BLANKFEIN, RISK MANAGER

While some of his partners still saw balancing Goldman Sachs's agency business with its principal investing as a worrisome choice, Lloyd Blankfein was sure it was instead a momentous strategic opportunity. At an internal meeting in London in 2005 he laid out his argument. It was a powerful extension of the strategic thinking that had originated with Friedman and Rubin and gathered force under Paulson—and could be traced all the way back to Gus Levy's business in arbitrage and block trading. For many years, Goldman Sachs had been able to do both—act on behalf of clients and invest aggressively for its own account—and keep them in acceptable balance. It accomplished that by emphasizing, particularly to clients and in public, the still-dominant agency business, particularly investment banking for corporations, research-based stockbrokerage, and investment management. The coexistence of agency and proprietary businesses had been feasible because proprietary activities were relatively small and incidental, and not in conflict most of the time with agency work for clients. So the choice between proprietary and agency had been deferrable, and deferring a choice had been profit-maximizing.

But both kinds of business were changing. No agency business had rising

profit margins, and most were requiring more capital and more risk-taking just to maintain market share. Brokerage commissions were being squeezed harder and harder by institutional investors, particularly mutual funds and pension funds, where managers argued that both fiduciary duties and competitive necessity compelled them to negotiate lower rates. Commercial banks were increasingly competing with loans they then securitized and sold to investors, and cutting prices to get more business in M&A advice and underwritings, particularly debt underwritings. The adverse trends had been developing for some years and could no longer be offset by increasing volume.

Meanwhile, principal businesses were growing, and profit margins were high and holding up because only a relatively few firms could seriously compete—and all the major competitors were smart enough not to ruin the party by competing on price. Real estate, a huge market, had moved away from a business of negotiated private deals into a business of transactions on both private and public markets. That played to Goldman Sachs's dual strengths in both private transactions and public-market transactions. Private transactions could be either principal deals employing the firm's own capital or controlled deals for the big funds the firm managed with capital raised from individual and institutional clients. Either way, the profit margins were much wider, competition was much less keen, and the scale of operation was now much larger thanks to Goldman Sachs's going public.

Goldman Sachs's competitors, notably the giant "universal" banks like Citigroup, JPMorgan Chase, Deutsche Bank, and UBS, increasingly used their balance sheets not only to extend credit but also to underwrite stock and bond offerings, and they used their credit relationships as leverage to get M&A mandates. Blankfein felt Goldman Sachs would either make a definite choice to go its own chosen way in this new world or it would lose the freedom to make its own choice and sooner or later—probably sooner—would have a clearly inferior choice imposed upon it. "How can Goldman Sachs survive in a world of the big balance-sheet firms of Citigroup and JPMorgan Chase?" was the question analysts asked year after year. Few believed Goldman Sachs could succeed as a stand-alone investment bank basing its business strategy on the agency business of giving advice.

Not only did the firm need to make a serious choice, it needed to make that

choice soon.[1] Given the pace of change in the world of finance, if Goldman Sachs was going to make that choice from a position of strength, it was probably now or never.

Blankfein made his case: Goldman Sachs's strategic opportunity—and, as he saw it, the firm's strategic imperative—was to integrate the roles of adviser, financier, and investor: giving astute advice and committing capital. The investment banking industry was reconverging after the repeal of Glass-Steagall: The merchant banking model of J. Pierpont Morgan, based on integrating lending with advice, was coming back. Goldman Sachs had the best advisory franchise in the world, but giving advice was not enough. Clients increasingly expected investment banks to help finance the transactions they recommended. The firm now had to be more willing to use its own capital on behalf of client transactions and for its own account.

As Blankfein asserted that day in London, Goldman Sachs had come of age and was no longer dependent on anyone or anything. With its worldwide operations *plus* its diversity of businesses *plus* its knowledge of economics, industries, companies, and markets *plus* its client relationships *plus* its capacity to embrace risks, the firm had developed for itself a unique strategic position. Each of those strengths was unequaled, and in aggregate they were unbeatable and unmatchable. Goldman Sachs was now free to capitalize on all the years of hard work and steady business development done by predecessors.

But it could all be lost.

Of course, it *would* be lost if the firm squandered its reputation or failed to anticipate, understand, and manage the many potential conflicts or failed to excel in its important agency businesses. It could be lost if the firm made the easy, obvious, familiar strategic blunder of designing its future strategy to replay old movies of its past success and staying too committed to the old agency business like stockbrokerege. Even Goldman Sachs could stabilize, stiffen, and lose bit by bit its vitality and its most valuable asset, the freedom to choose its own course. Shrinking profit margins would translate into inability to continue being Wall Street's most rewarding employer. And over time that would mean losing the unmatched ability to attract and keep the very best people. Already, the firm was losing a few star performers to hedge funds and private-equity firms. Everyone knew that Goldman Sachs did great recruiting and excellent training, so it was every

recruiter's favorite fishing ground—and not every great employee would love forever the long hours and the intensity of working at Goldman Sachs. Take away the remarkable rewards and then have two or three so-so years—or worse—and the war for talent would be in full force against Goldman Sachs.

But that bleak future needn't come to pass, Blankfein told his colleagues. There was an alternative—a better, more profitable alternative. "We have the capital and investment prowess; we have one of the fastest growing asset-management operations in the world; we have the risk-management skills; we have the proprietary research; we have the originating deal-flow through our thousands of corporate relationships and our dozens of major relationships with private-equity firms; we have the knowledge of all the major financial markets around the world; we have the creative, driven people; and so we have every opportunity to reorient our business around both the needs of our clients and the traditional strengths of our firm." The proposition had one *if*—and really only one: *If* the firm had the wit to recognize that the strategic choice was not agency *or* principal. The best choice was and would be agency and principal combined together in an unbeatable whole.

As Blankfein explained, "We definitely need to continue nurturing major relationships with corporations, central banks, funds, and investors because they provide us with more and better deal-flow than anyone else, and we always need to preserve and build that great strength as much as possible. It is vital to our ability to be profitable and attract outstanding people to Goldman Sachs. Agency relationships are crucial to the firm. But never forget: When combined with being a principal, this strategy of being an adviser, financier, and co-investor allows us to recruit and keep the best people and keep building our reputation as the preeminent investment bank in the world. But if we insist on anchoring our firm only to the pure agency service strategy of the past, we will surely, gradually at first but inevitably with acceleration, cease to be leaders and even lose our relevance."

The crucial differentiating advantage of Goldman Sachs would be one that outsiders might find surprising: Its complex variety of many businesses was sure to have lots of conflicts. Goldman Sachs, Blankfein said, should embrace the challenge of those conflicts. Like market risk, the risk of conflicts would keep most competitors away—but by engaging actively with clients, Goldman Sachs

would understand these conflicts better and could manage them better. Blankfein (who spends a significant part of his time managing real or perceived conflicts) said, "If major clients—governments, institutional investors, corporations, and wealthy families—believe they can trust our judgment, we can invite them to partner with us and share in their success."

By the time he gave this speech, Blankfein was well on his way to the top of Goldman Sachs. It had been a long, circuitous journey. Coming out of Harvard Law School in 1978 after Harvard College—both on scholarship, since his father was a Brooklyn postal clerk—he had tried for a job at Goldman Sachs but was turned down. He worked for a while at Donovan & Leisure but left that law firm (where his supervising partner said he was the only departing associate he truly missed) when a headhunter called him up and suggested he might be a fit with J. Aron. Blankfein wanted great success and was already perceiving that even with two Harvard degrees, his career in corporate law would be constrained and he would probably never create a fortune.

He wanted to manage a business and was intrigued with markets. He signed on at J. Aron when Herb Coyne was hiring people with law school training to solve complex problems and explain the solutions to clients. Where Donovan & Leisure was formal and uptight, J. Aron was informal—almost Wild West. With his delightful sense of humor and understanding of people, Blankfein soon became an unusually successful customer's man. He matched his obvious brainpower with unusual emotional intelligence and quickly developed acute numeracy to go with his verbal fluency. Unusually for anyone as bright as he was, Blankfein showed none of the frequently associated arrogance. Instead, he was accessible to others, so they too benefited from his perceptions, analysis, and judgment. And he was funny.

When J. Aron was acquired, Blankfein got into Goldman Sachs by the back door—and just barely. Fortunately, Mark Winkelman decided not to include him in the major layoffs and, against Bob Rubin's advice, encouraged Blankfein to switch from sales to trading. J. Aron expanded into risk-embracing trading in currencies as well as in oil and other commodities, and Blankfein flourished and rode the expansion to increasing authority.

Recognizing earlier than most that the major institutional investors were sure to continue squeezing the commission-based agency business, he concentrated on

doing business with hedge funds. Their focus was on making money, not on saving costs; they acted quickly and paid full fare, so they were more profitable and, while much smaller in assets than the major institutions, their high turnover made them more profitable accounts for Goldman Sachs. Far better than most securities firms, Goldman Sachs knew how to meet their needs in a win-win working relationship.

Principal, risk-embracing trading in currencies was extended into derivatives and on into fixed income where embedded options increasingly mattered. Simultaneously, competition—particularly from large commercial banks—drove the profits from investment banking lower and the need to deploy large capital commitments higher. As a result, the traditional strategic priority of Goldman Sachs and its core profitability declined persistently and substantially. Risk-embracing trading grew more and more important in scale and profitability while the old pure agency service businesses faded. Blankfein was gaining strength within the businesses that were getting steadily stronger.

As one after another rival got outmaneuvered, his power compounded, and he had the political prowess, the ruthless objectivity, the capacity to learn and adapt quickly, and the driving ambition to go all the way to the top. His standing, particularly with Hank Paulson, continued to rise as their articulated visions for the future Goldman Sachs came into closer alignment. Blankfein was always looking ahead at least several moves and understood what was really important to the organization and to his seniors. He was skillful at managing upward. "His seniors *all* thought he was just terrific," says a colleague from his early years. When unit heads at J. Aron were all asked to produce quarterly reviews of their units' operations, Blankfein somehow knew this was a major request. While other unit heads treated it lightly, he did a superb job and broke out of the pack.

"We all knew that in our crowd of bright, committed fast-track young professionals, Lloyd was the exception," says the former colleague. "So very smart. So very quick. What a wonderful, nice sense of humor. And so original in his perceptions and analysis. He had great perspective: time and again he was seeing things very differently, way outside the box. Mark Winkelman picked it up right away too. Mark never laughed, never smiled, and always seemed *so* serious, while Lloyd was always seeing the comic side. But the minds of those two had an amazing understanding and bonding right from the start."

Blankfein's detached rationality generated fear and respect—and cut out costs that were not producing profits. When he visited one of the international offices, he asked, "What are all these guys doing?" First the flowers and the big bowls of fresh fruit were gone. Then the free soda. Then 20 percent of the staff was gone. Then another 20 percent was gone. Costs were coming down and people were cut out—almost as easily as the fruit and soda. They were costs too.

Blankfein surrounds himself with unusually bright people he has learned to trust over years of working together. His past as a lawyer comes out as he questions and questions until satisfied. Those who know him well say he wants to be challenged—not to be proven right, but to get to the right answer. Others are not so sure. "Lloyd is really smart—and he knows it," said a former partner. "He wants really smart people who will anticipate market trends and client needs and anticipate what he'll want even before he decides. Lloyd is usually right, but his centralized way of making decisions means Goldman Sachs is not *my* firm anymore."

Seemingly always in a state of anxiety, Blankfein says, "If I weren't afraid to assert anything with any kind of confidence, I would tell you that I'm the most insecure person in the world."[2] He is certainly not alone. Even with the powers and successes of today's Goldman Sachs, those old-time anxieties and insecurities that characterized the firm when it was striving for acceptance decades ago—or entering the established markets of Europe or Asia as outsiders or launching new businesses that nobody had yet mastered—continue to lurk at the core of the firm. Blankfein muses that Goldman Sachs's culture is "an interesting blend of confidence and commitment to excellence, and an inbred insecurity that drives people to keep working and producing long after they need to. We cringe at the prospect of not being liked by a client. People who go on to other commercial pursuits frequently self-identify as a former Goldman Sachs employee long after they have left the firm. Alumni take a lot of pride in having worked here."[3]

His rationality enables Blankfein to see opportunities for useful "soft" moves away from habitual "tribal" mistakes like the long history of treating retiring partners as almost instant outsiders—with abruptly downgraded ratings of their formerly admired capabilities. While this may have been an understandable reflection of both ambitions and insecurities, it was also an enormous waste of opportunity. With most partners going limited in their late forties—with twenty high-productivity years still ahead of them and with experience, expertise, and

vibrant network relationships that would and did enable them to do great things elsewhere—it was a head-shaking wonder to see them feeling jettisoned by the firm they had served so well and were so committed to for so many years.

Blankfein is taking Hank Paulson's first steps—annual dinners for former partners with candid briefings on progress and a Web site—to a whole new level. A former partner has been meeting with all interested prior partners to learn firsthand what they would like the firm to do for them and what they would be interested in doing for the firm. The response has been positive, and the prospects for significant, profitable business are encouraging. Blankfein continues to increase the firm's commitment, and his own, to the Pine Street leadership development program. Notorious for asking questions, he seems to thrive on being interrogated by well-informed institutional investors. Where other organizations' leaders offer a set-piece presentation and give stock answers to a few questions, Blankfein likes to go directly to Q&A and often responds best to the toughest challenges.

Risk is complex and deceptive. There are known risks and unknown risks. And risk is not entirely quantitative. At the margin, managing risk is closer to an art than to a science and depends on experience and judgment. That's why the original J. P. Morgan so wisely emphasized character as the basis for extending credit.

Modern finance is based on one great simplifying assumption—that markets are efficient and that market prices reflect almost all that is known or knowable. So, if diversified to absorb imperfections, the aggregate portfolio will be "market efficient." Of course, for every rule there will be exceptions—exceptions that prove the rule—so when dealing with new or unusual securities, investors should diversify even more widely, adding a margin of safety so their portfolios will be protected against risks—except for the unusual and unexpected anomalies called black swans.

Too much faith in the rationality of the efficient market is *not* rational. In the vernacular, stuff happens. As chair of Goldman Sachs's audit committee, John Browne, the celebrated leader of BP, focused on risk management. Browne was pleased to see that discussions of risk—always complex and arcane in the securities business—were open, candid, and comprehensive at Goldman Sachs. Browne's

challenge after the IPO was to transform risk management from the "family style" of a partnership to the procedural formality appropriate to a corporation—without losing the advantages of individuals taking personal responsibility for vigilance and accountability. One risk in auditing or in risk management is for a leader to stay too long in the responsible position, getting to know and like people as people, and developing perhaps too much trust or tolerance. There is a risk of going from not knowing enough to knowing enough and then on to thinking you know more than you do. Those with substantial experience knew that analytical models like value at risk (VaR), however widely celebrated as the latest thing in risk controls, would catch all the normal risks, but not the "killer" risks—the toxic black swans that reside in the six-sigma "fat tails" of a normal bell-curve distribution of probable events.

Almost every element of risk—toxic or rewarding—was on display in the mortgage crisis that rocked the United States and the world in 2007. At Goldman Sachs, the structured-products group of sixteen traders is responsible for making a market for clients trading a variety of securities based on residential mortgages. Simultaneously but quite separately, members of this group trade or invest the firm's own capital or take the other side of a client's transaction, either because they see a good opportunity or to fulfill their role as a market maker. Because those businesses are separate, it's well understood by all parties that Goldman Sachs has no obligation to tell trading clients what it is doing in its proprietary activities—even when it is handling buy orders for clients' accounts and selling for its own account, as was the situation in 2007.

A year earlier, in yet another line of business, Goldman Sachs had been a major underwriter of securities backed by subprime mortgages. Because subprime mortgage-backed bonds traded only occasionally and only privately, a new family of indexes, called ABX, was created to reflect these bonds' values based on instruments called credit-default swaps. These are derivatives that pay the buyer if borrowers default on their mortgages and the mortgage-backed securities fall in price. The derivatives actually trade more often than the bonds themselves, with their prices rising or falling as investors' views of the risk of subprime defaults rise and fall. As expected within the firm's mortgage department, the introduction of the ABX was great for traders: The firm made $1 million on the first day, but volume was thin and the firm had to use its own capital on most trades.

In December 2006, David Viniar, the firm's highly respected, long-serving, and unflappable CFO, pressed for a more negative posture on subprime mortgages.[4] He wanted the firm to offset its long position in collateralized debt obligations (CDOs) and other arcane securities that it had underwritten and was holding in inventory to trade for customers, and to do so by shorting parts of the ABX or buying credit-default swaps. When traders complained they did not know how to price their portfolios, Blankfein ordered them to sell 10 percent of every position: "*That's* the market price. Mark to that." Since the market was so thin, it took months to complete hedging the firm's exposure. By February 2007, the firm had a large short position, focused on the riskiest part of the ABX.[5] That index would drop rapidly from about 90 to nearly 60.

In late April, Dan Sparks, head of mortgages, and two traders, Josh Birnbaum and Michael Swenson, met with a small group of senior executives and warned of a major problem with the firm's inventory of $10 billion in CDOs: It was heading south. Sparks wanted the firm to cancel underwriting any pending CDO issues, sell all the inventory it could, and make major bets against the ABX index. Sparks's recommendation was accepted and implemented. By midsummer, with its change in position, Goldman Sachs was making large profits for its own account—while two Bear Stearns hedge funds vaporized and rumors were rife of major CDO losses at other firms. During the third quarter, this one unit reportedly made $1 billion.[6]

The separation between business units—and, dramatically, between their results—was made starkly explicit by the firm's response to stunning losses in the Global Opportunities Fund and Global Alpha. The first was a pure "quantitative equity strategies" fund; the second was a "macro strategies" fund. Global Alpha was considered the flagship of Goldman Sachs Asset Management, and both were quantitative funds—committed to following computer-generated trading signals. They combined the firm's vaunted expertise in risk management with its leadership in the world's markets for stocks, bonds, currencies, and commodities. Regularly described as rigorously risk-averse and asset-protective, Global Alpha was designed to have volatility or risk similar to the S&P 500 with returns that were advantageously uncorrelated with the S&P. The fund had produced a series of strong results and, being highly salable, was gathering assets at such a rapid

clip that its managers spoke solemnly about limiting cash inflows to protect its ability to generate superior returns. Suddenly, in a single week in the third quarter of 2007, Global Alpha lost 30 percent of its value and Global Opportunities lost even more. The total loss in Global Alpha for the year was 37 percent.

During the same quarter, Goldman Sachs's reported profits increased 79 percent. While certainly not identical, the causes of the sharp loss and the strong gain were both connected to market reactions to the crisis in subprime mortgage-backed securities, whose roots traced back to years of sloppiness by credit providers and regulators.[7]

Global Alpha was highly liquid and could sell investments to reduce debt as assets fell. Global Opportunities was not liquid, so to prevent a highly visible failure, large amounts of new money were needed immediately, and there was too little time to raise the necessary capital from investors in the fund. Goldman Sachs injected $2 billion and raised another $1 billion from wealthy individuals like Eli Broad, in part to have an arm's-length validation of the terms for its own investment. CFO Viniar explained, "This is not a rescue. We believe this is a good investment." And so it would prove to be—from the depressed level at which it was made—for Goldman Sachs. The profit on the capital infusion was reported as $370 million in the first month.

As a partner reflects, "Only looking back could we see the real risk—the risk of arrogance. We didn't see it then, but it was there and it was growing because the outsiders of Goldman Sachs were no longer the outsiders. The firm was at the top. We had always been the best—always the top students and the best athletes and the class leaders. And now we were at the best firm—in our own self-appraisal. But that was the first step toward arrogance." Blankfein drew a similar lesson: "We're not that much smarter than the guys who got hurt so badly this time around, so we certainly can't be complacent."

While Global Alpha and its investors suffered major losses, and investors in securities underwritten by the firm experienced seriously disappointing performance, the firm and its own investors enjoyed the substantial profits Goldman Sachs produced by taking an astute and almost unique short position

in the subprime mortgage market. While some would question whether the firm did not have an overarching fiduciary responsibility to all clients and customers to share its expertise across all three areas, senior management was and is clear: Each business unit is responsible and accountable for doing its best to complete the mission of that particular business—period. No business is its brother's keeper. Each tub on its own bottom.

The firm presents itself as a problem-solving provider of solutions. As an organization of skillful, smart, experienced people connected to corporations, governments, institutions, and expertise all over the world—an organization with its own capital, access to all the major markets, and a formidable appetite for risk—it has the ability to draw reliably, repetitively, and rapidly on all these strengths to create solutions of its own design that address customers' problems in ways no other firm in the world can match. The firm's strategic objective is to be recognized widely as the world's best solutions provider so that it will get the first call and will always have the freshest information, the most traffic, and the best opportunity to innovate—at the highest profits.

As an intermediary's service becomes a commodity or gets automated, the importance of being capable and committed to acting as a risk-assuming, capital-based, multimarket solutions provider goes up a lot—and so do the profits. If General Electric had a complex problem ten years ago, Goldman Sachs might have earned a $10 million fee for working out the best available agency solution. Today, with more precise knowledge of the various demands in specific markets, the firm may divide the problem into a variety of new, specialized components and work out a series of actions component by component—some pure agency, some principal, some a blend of both—with a variety of risk characteristics and a range of counterparties that would have been unheard of ten years ago and may still be unknown to most competitors.

Goldman Sachs has again reinvented itself into a new kind of financial organization that is profoundly independent—no longer dependent on one or two lines or business, no longer dependent on any particular market, no longer dependent on the goodwill of any corporation or institution, and no longer dependent on any single technology.

As a past partner explains, "In the blend of agency and principal-with-risk business, it's the principal business that really rings the cash register. I loved old

Goldman Sachs and respect new Goldman Sachs. Respect is more important than a favorable regard to Goldman Sachs today." But another partner says, "Today Goldman Sachs is number one with clients and has arguably the best reputation and the dominant market share, and is best positioned to attract the brightest recruits. The firm has never been more focused on clients."

Yet Blankfein's self-professed insecurity, and even the traditional touch of paranoia, still very much has a place. The partnership, more than any private company, perhaps in the world, is free to choose its own future—unless, perhaps in a period of poorly performing global markets or because of catastrophic losses, the ultimate imperative of making larger and larger profits becomes too difficult. That would erode the edge that has enabled Goldman Sachs to attract, develop, motivate, and keep most of the financial industry's best people, always its strategic constraint.

The partnership is creating more successes than ever before, in more ways and places for more people, but it must always do better and better. That's why so many remarkable, capable, and ambitious people join the firm. And that's why Blankfein may have the toughest job ever as the leader of Goldman Sachs. And his successor's job will be harder still.

AFTERWORD

Friendship has been a vital factor in enlisting more than one hundred partners of Goldman Sachs to share with me their own recollections and stories about the firm. Our meetings, interviews, and critique-review sessions have renewed and enriched the many associations I so enjoyed developing while serving over three decades as a strategy consultant to the leaders of various parts of the firm in Asia, Europe, and North America. Readers should know that most of the conversations reported here are best-effort re-creations. In many cases I was not there, and those who were there are subject to all the familiar difficulties of precise recollection. That's why each conversation has been reviewed with those who know best what was said and how it was said. Not surprisingly, these reviews have reduced the amount of slang and the frequency of conventional expletives while increasing the substance.

Accuracy about names, dates, and facts is a strong habit—even a compulsion—for investment bankers generally and particularly for the partners of Goldman Sachs. Whenever possible, facts and perceptions have been verified by those partners of the firm who lived the experience. An example is telling: To check for accuracy and objectivity, I sent a draft of one chapter to one former

partner. Several errors of fact and one misunderstanding—or misrepresentation, depending on your own perspective—were identified. Within a week, to be certain the story was factually accurate, four senior partners who had been out of the firm for fifteen years, all still very busy people, had offered to meet with me. Three current partners also agreed to help get the story told as accurately as possible. Six other former partners were helpful via telephone.

The same kind of generosity—born out of caring for the Goldman Sachs they knew or know—was shown by Treasury secretary Hank Paulson's spending nearly two hours with me the day after he returned from an important negotiating trip to China; former Treasury secretary Robert Rubin's spending three hours in two meetings; former undersecretary of state John Whitehead's meeting six times (most recently between calls to UN secretary general Kofi Annan and New York mayor Michael Bloomberg) and, while on vacation in Africa, correcting names and dates in an early draft; John Weinberg's inviting me to his home several times for three-hour sessions; or Geoff Boisi, Frank Brosens, John Browne, Lee Cooperman, Eric Dobkin, George Doty, Gene Fife, Bob Freeman, Steve Friedman, Jim Gorter, Steve Hendel, Bob Hurst, Steve Kay, Fred Krimendahl, Bill Landreth, John McNulty, Bob Menschel, Richard Menschel, Robin Neustein, John Rogers, Peter Sachs, David Silfen, Frank Smeal, Roy Smith, Bob Steel, L. Jay Tenenbaum, Barry Volpert, Pat Ward, Peter Weinberg, Mark Winkelman, Richard Worley, Ray Young, and Roy Zuckerberg each meeting with me numerous times.

Spacious as this book has become, the story of Goldman Sachs is more spacious still. A few of the firm's landmark adventures have been squeezed out of these pages by compassion for the reader. Primary among them is the long series of wildly complex deals in which Goldman Sachs was involved in selling and buying New York's Rockefeller Center, and then selling it again, more than doubling the firm's investment in five years to $1.85 billion. For similar reasons, dozens of lesser fascinating or amazing stories have been relegated to the end notes that follow these pages.

As my interest in researching and writing a study of America's great professional firms increased, that interest had to remain an abstraction. I was totally immersed in a thirty-year all-out drive to lead Greenwich Associates in developing a worldwide franchise of research-based strategy consulting with senior management at professional financial services organizations. Our dream was to serve the leaders in all of the world's 135 financial markets. Developing colle-

gial relationships with each of these complex client organizations absorbed all the time and energy my partners and I had. All of us put aside other interests to focus on our own firm's immediate challenges.

By the mid-1990s, the demands on time had crested and other activities were permissible. Appointed to the Overseers' Visiting Committee at the Harvard Business School, I was delighted to note that John Whitehead would chair our group. I admired him as the finest strategist and organization leader-builder on Wall Street and as my most rigorous, through, and effective client. On a personal level, I liked him and found his high expectations inspiring. Besides, I had an idea for a book and would need John's cooperation.

Working with the clients of Greenwich Associates, I'd gotten acquainted with many of Wall Street's most interesting people and had heard stories of many others. My plan was to write insightful profiles of the most interesting contemporaries and collect the best available profiles of prior heroes—and villains—into an enjoyable weekend reader. I couldn't imagine such a collection without Whitehead. So, much as I intended to serve Harvard Business School in our two-day meeting, I also hoped to persuade John to let me write a profile of him. It wouldn't be easy: As a firm, Goldman Sachs has a near fetish about no publicity, particularly for individuals—which is why there had never been a profile on John Whitehead or John Weinberg—and Whitehead had already deflected me when I had first raised the subject. "That's not really our way here." But he had not said no.

Lucky me. During the social hour at the end of the first day of meetings at HBS, I noticed a slim, stylish woman I'd never met but everyone knew: the first woman to became a star television reporter—the young, assertive woman who reported on the Kennedy administration, Nancy Dickerson—Nancy Dickerson Whitehead.

Knowing she would understand the merits of visibility and recognition as a leader, I introduced myself: "I need your help. I'm writing a book about the great leaders in the world of finance, and your husband should be one of the people featured most prominently. Several others have already agreed to participate, and John Wiley & Sons will publish the book next year. Can you help me persuade your reluctant husband?"

"Sounds interesting, but I'll have to talk with John. He would have to decide."

Lucky again. After our meetings, I caught the early Sunday morning shuttle from Boston to LaGuardia. The plane was nearly empty—but John and Nancy Whitehead were already on it. With a quiet smile Nancy said, "Call John on Monday."

When I called and made an appointment for an interview, I knew that the "weekend reader" book of profiles would make it.* More important, that interview with John Whitehead would be the first step taken toward the present book. The second was when John Weinberg decided that if his friend and partner was participating, he probably should too. We met several times on Sundays at the Weinberg home. I became sure that an objective study of Goldman Sachs could and should be done. I was determined to do it.

Over the next few years, I met with and interviewed the partners and former partners I had known best. The more I learned, the more I was sure that a serious book about Goldman Sachs would be interesting to do and very interesting to read, and that to be accurate it had to be an up-close and personal study. However, at Goldman Sachs—perhaps because the firm was going public, perhaps because firm leadership had changed, perhaps due to a resurgence of the firm's traditional reluctance to have any outsiders write anything that the firm does not control—willingness to see a candid study done as a book slowed way down. This came to me in the person of the firm's longtime public relations specialist, Ed Novotny, who called to say he understood I was interviewing various Goldman Sachs alumni for a possible book and that he would like to meet me. We met for lunch at the Yale Club across from Grand Central Terminal, and Ed explained that senior management had asked him or one of his people to accompany me on all my interviews; if that condition was not accepted, the firm would pass the word to everyone not to cooperate with me in any way. He hoped I would understand.

Having no alternative, I agreed to give it a try, but it soon proved hopeless. A "chaperone" from Public Relations would come to each interview. While everyone was polite, the character of the interviews changed from candid and interesting to cautious and dull. The difference was decisive—and depressing. I was getting pablum. I would have to give up on something for which I had had such high hopes.

* It was published by Wiley in two volumes as *Wall Street People* in 1996.

Coincidentally, I happened to have lunch at Michael's Restaurant on Fifty-fifth Street in Manhattan with two old friends. After a while, one of them, Gershon Kekst, the preeminent public relations consultant to corporations, asked me, "So, Charley, what's important in your life these days?"

"You're a week too late with that question, Gershon. Last week I could have told you, but not this week."

"What happened?"

"Last week I was all excited about writing a serious book about Goldman Sachs and how it became the leading securities firm in the world, but that's now over. They've started sending chaperones to sit in on my interviews, so I'm not getting the spontaneous candor or insights you really need to tell the story accurately, and I'm only going to do such a book if I can do it right—and that means 100 percent objectivity, warts and all, which is never going to happen with those chaperones."

Kekst reflected on this lament briefly and, looking straight at me, said quietly, "Call my office—after four." He then explained that he was a public relations consultant to the firm and would be glad to speak on behalf of the project.

At 4:01 that afternoon, I called Gershon, who mentioned a name at Goldman Sachs and added, "He's expecting your call. He'll work it out with you." While I'll never know for sure, Gershon must have said something like "A book on Goldman Sachs is inevitable, so why not cooperate with someone the firm knows who will produce a serious book?" The simplicity of the arrangement was all I could ask for: I would have access to the firm's archives and could interview all the alumni I wanted, come back with a draft of several chapters, and work from there together. Word would be passed that anyone interested should participate; that Goldman Sachs would help with factual accuracy; that one executive would read drafts for warts-and-all objectivity; and that final decisions on content, style, and evaluations would be entirely mine to make.

The previous time this book nearly never got written was in 1973, the second year in the early torturous struggle to bring Greenwich Associates into being. With just $3,000 of capital, a one-room walk-up office, no clients, no experience in consulting, one employee, and just enough savings to go for a year without any income, Greenwich Associates and I began the scramble to make it. The early seventies were not a great time in financial services: As the stock market fell and

interest rates increased again and again, investment banks, commercial banks, and bond dealers were all cutting costs; they had no compelling need for a new, untried kind of research-based consulting service from a new, untested firm.

In this grim environment, I was surprised to receive a call from Inez Sollami, secretary to Gustave Levy, the senior partner of Goldman Sachs: "Mr. Levy wants to see you Wednesday morning." For weeks I'd been trying to see someone—anyone—at Goldman Sachs, the leading institutional stockbroker, so this was a real break. As I reached for my appointment calendar, she continued, "At seven thirty sharp." I'd never heard of anybody having a business meeting in the office that early in the morning and didn't know what train might get me there, but I certainly didn't care. "Thank you. I'll be there."

On arrival at Goldman Sachs, I was taken to Levy's curious and unique office in the middle of the trading room.

"I understand you have a report on Goldman Sachs and Company."

"Yes, Mr. Levy."

"Call me Gus."

"Yes, sir. We do have such a report, but—"

"I'd like to see it."

"I'm sorry, but I was about to say we cannot offer it to you. Like an underwriting, we offered our service starting nearly two months ago and couldn't get anybody at Goldman Sachs interested before the offering period closed for this year—over a week ago. So I'm sorry to say it's no longer available this year."

"We both know it can't cost you more than $20 to make another copy. And I think you do know I can get what I want on Wall Street."

"Yes, I know. But we promised our clients."

Levy must have thought I was the dumbest guy he'd ever met. He waved his hand in dismissal and turned his attention quickly to other things.

As I left, it dawned on me that I now would have to tell my friend and partner, Allan Munro, that I had not only turned down a fee we desperately needed but also surely jinxed for all time any chance of ever working with Goldman Sachs by offending its legendary senior partner. As it happened, Allan was in California and we had no chance to talk together for two days. By the time we did, I had seen Goldman Sachs partner Bob Menschel while walking along Wall Street: "Hear you saw Gus yesterday." My heart sank: Was Levy so offended by my declining

his offer that he had actually discussed it with his partner? Warmly, Bob continued, "Gus thought you were okay."

I was so relieved—and elated—that as soon as I was far enough along the sidewalk that Bob would not notice, I jumped into the air and clicked my heels, thinking, "Just wait until next year!" We were almost certain to have Goldman Sachs as our client then, because our research on the performance of all the major firms showed good news for Goldman Sachs: It was one of the best.

In the decades since then, one of my great pleasures has been to witness the remarkably consistent, gracious, and professional way that staff members bring to life every day the Principles of Goldman Sachs.

The last time this book was nearly never written is now. Given the remarkable talents and the driving ambitions of the many people of Goldman Sachs, it cannot be surprising that strong differences are experienced at all levels. Some differences are philosophical, some are personal. In the urgency to get on with the business, many hurt feelings and mistakes were never addressed or resolved. Many are revealed here for the first time. If a vote of the partnership were taken today, this book would surely be scuttled.

ACKNOWLEDGMENTS

William S. Rukeyser, as editor extraordinaire, has been my partner, mentor, and friend in the multidimensional challenge of converting draft chapters into a finished book. Sometimes admonishing, always genial, and superbly skillful, he has worked his magic on many levels—therapist, teacher, coach, trainer, cheerleader, and chaplain. We met and worked together when he was establishing *Money* as the best consumer magazine in personal finance and investing. I wrote a short piece, which he edited with a combination of grace, skill, and impact that astonished me over thirty years ago. We lost touch, but when I met another Rukeyser, I asked, "Do you know Bill Rukeyser?" and learned I was speaking with one of his brothers. Getting contact information, I reached out hoping Bill could, perhaps, nominate a capable editor for me to work with. Mercifully, he agreed to edit a book on Goldman Sachs himself. He is a master. Over more than a year of intense work, our relationship continues to be increasingly effective and fun.

Working with deadlines—by taking on too many commitments—has always been part of my career, beginning with sprints across the Harvard Business School campus to slip my written analysis of a case, or WAC, into the slot that would shut tight on the ninth bell for 9:00 on Saturday night, and at least once only making it by the eighth bell. Even though work on this book began twenty-five years ago

and has been a priority commitment for most of the past ten years, as we zoomed toward the final few days when no extensions could possibly be granted, I was precommitted to working in Seoul and Singapore and, despite substantial jet lag, requested a wake-up call at 2 a.m. to keep up with Bill in an hour-long, last-minute final rewrite of a particularly complicated chapter. Even that was fun.

John Gaddis, one of Yale's most popular professors and a superb historian and friend, introduced me to Andrew Wylie, my literary agent, who took a précis for this book to dinner on Shelter Island with John Makinson of Penguin. After discussing several book ideas, Makinson said, "What I really want is a book on Goldman Sachs." Smiling, Andrew pulled out my précis and, before he left the table, a deal was done. Ann Godoff and Vanessa Mobley have made the challenge of meeting submission deadlines—adjusted mercifully three times—more than stimulating and quite inspiring. As our main editor, Vanessa beautifully balanced personal grace and decisive good judgment.

Catharine Fortin and Kimberly Breed have joined with patience and goodwill in the numerous challenges of typing longhand drafts in illegibly small writing with imperfect pens and crotchety facsimiles. Ed Canaday of Goldman Sachs graciously took charge of fact-checking all dates, names, and amounts, but all remaining errors are clearly mine alone.

Linda Koch Lorimer—my beloved wife and best friend—reviewed and critiqued an early draft with her usual unusual ability to provide perceptive insight and advice. Eli Jacobs and David Darst both improved the final text significantly by tightening up the story and the telling.

More than one hundred partners of Goldman Sachs and the nearly as many competitors who have helped me understand the achievements of Goldman Sachs and the world in which they were accomplished have individually and collectively made writing this book one of my most treasured experiences in a very fortunate life. I am forever grateful.

My one regret is that most of the people who make Goldman Sachs the great firm that it is, and most of the work that they do, must go unreported in this necessarily selective sampling of their wide, deep, and continuous collective determination to excel. That's the irony of selfless dedication to teamwork in an organization where exceptional talent, skill, and drive are so consistently "usual." And that's what makes Goldman Sachs the greatest financial institution in the world today.

NOTES

Chapter One Beginnings

1. DeCoppet & Doremus, Charles M. Schott, and John H. Jacqueline.
2. Paul Sachs retired from the business in 1914 and joined the faculty of fine arts at Harvard, where, years later, he and his wife entertained Sidney's son, John Weinberg, for regular Sunday luncheons during his student years at Harvard Business School. Weinberg continued his learning in later life by reading books, particularly on Abraham Lincoln, and collecting Lincolniana. He eventually received honorary degrees from Harvard and Yale.
3. *New York Times*, July 24, 1969.
4. Paul Cabot.
5. Walter Sachs.
6. Joseph, born in Wurzburg, Bavaria, in 1817, had served as tutor to the daughter of a well-off goldsmith named Baer; he eventually fell in love and eloped with the girl, Sophia Baer, and sailed in 1848 to Baltimore, where they raised five children. Just before the Civil War, Joseph moved his family to New York City, where he established a school for boys.
7. Walter joined the firm actively in 1908 and stayed involved until his death at ninety-six in 1980.
8. Walter E. Sachs, Memoirs from Columbia University Oral History Collection, p. 46.
9. Sachs, p. 50. Their New York agent then was Winter & Smillie.
10. Sachs p. 53. The business was run by Siegfried Bieber for many years until he returned to Germany to be a director of Berliner Handelgesellschaf.
11. Sachs, pp. 60–62.
12. A combination of three cigar manufacturers: Wertheim & Schiffer, Hirschorn Mack & Co., and Straiton & Storm.
13. Father of Maurice Wertheim, founder of Wertheim & Co., now part of Schroders.
14. Stephen Birmingham, *Our Crowd* (New York: Harper & Row, 1967).
15. Sachs, p. 79.
16. Her husband, Samuel Hammerslough, who sold men's haberdashery, was Rosenwald's uncle. Reputedly, one of his customers in Illinois, who could never find trousers long enough to fit, was Abraham Lincoln.
17. Kleinwort & Sons had little or no distribution

capability—selling was considered crude and was socially disdained—so they simply held the stocks they had underwritten until World War II. They made a paper fortune, but it didn't last. During the war the British government expropriated all foreign investments of British subjects, and the Kleinworts patriotically put the money into "Daltons"—low-interest government bonds with no fixed maturity date. A decade later, the bonds' market value had dropped by 85 percent.

Chapter Two Disaster: Goldman Sachs Trading Corporation

1. Stephen Birmingham, *Our Crowd* (New York: Harper & Row, 1967), p. 336.
2. Hard feelings continued to exist between the two firms until 1956, when Sears Roebuck decided to set up a sales-acceptance (financing) subsidiary and Sidney Weinberg called on Robert Lehman, Philip Lehman's son, to invite Lehman Brothers to resume its historical place in Sears's financings. Even then, there was continuing rivalry over which name would go first. When Gimbel's department store was brought to market, Bobby Lehman said he wanted to honor his father by listing Lehman Brothers in the preferred position. Sidney Weinberg protested: "We can't honor my father—he was a tailor!" Weinberg prevailed, as usual: Goldman Sachs stayed first.
3. Albert Gordon, in discussion with the author, November 2000.
4. Written in collaboration with William T. Foster.
5. In 1923, for example, Thomas McInnerney, president of Hydrox Ice Cream in Chicago, merged his company with Rieck-McJunkin Dairy Co. of Pittsburgh to form the nucleus of National Dairy Products, which then acquired a series of other dairy companies. Postum went public with an issue led by Goldman Sachs, Lehman Brothers, and E.F. Hutton; with acquisitions of such brands as Maxwell House and Jell-O, it eventually became General Foods. Goldman Sachs financed Warner Brothers's conversion to the "talkies."

Chapter Three The Long Road Back

1. Al Feld, November 17, 1996.
2. The firm had only three hundred to four hundred employees during Weinberg's years.

In 2007 Goldman Sachs employed nearly thirty thousand.

3. *Time*, August 1, 1969, p. 69a.

4. At his peak, Whitney had borrowed over five million dollars in unsecured loans from friends and business associates, plus $2,897,000 from his brother George Whitney and $474,000 from J.P. Morgan & Company. He pledged $657,000 in bonds from the New York Stock Exchange's Employee Gratuity Fund, as well as several clients' securities, to collateralize the large personal loans with which he raised money to meet margin calls. In 111 different transactions, he borrowed money to repay loans that totaled nearly twenty-five million dollars.

7. *Fortune*, June 1937.

8. Sachs, p. 175.

9. Arranged through a Goldman Sachs partner, Ernest Loveman, who had developed longstanding friendships with the principals.

10. Kahn.

11. *Fortune*, August 2, 1989, p. 84.

12. Musica had been in and out of trouble with the police and had been in prison twice—once for bribing customs officials and once for grand larceny—but he was charming. When a detective sighted him at Grand Central Terminal and called out, "Hello, Phil!" Musica, who was well into his years of impersonating F. Donald Coster, didn't miss a beat. Explaining confidently that he had gone straight and had a new business in Greenwich Village, he urged the policeman to "come on down for a visit."

13. *Fortune*, August 2, 1989, p.84. Musica, the deputy treasurer, and an agent of McKesson were found, when fingerprinted, to be brothers who had executed a carefully planned scheme to embezzle the funds.

14. *Harper's Monthly*, 1937, p. 586.

15. *Newsweek*, August 4, 1969.

16. *Journal-American*, October 22, 1937.

17. The invitation came through retiring Ambassador Joseph E. Davies. In August 1939, Weinberg crossed the Atlantic on Davies's luxury yacht, *Sea Cloud*. "You were the life of the whole party and with your wit and humor you kept us all in a good frame of mind and made the trip enjoyable and full of interest," wrote another passenger, Richard S. Whaley, chief justice of the U.S. Court of Claims.

18. Weinberg had another reason: His wife and sons would not have gone because it would require taking the boys out of school.

19. *New York Post*, April 26, 1938.

20. *Time*, December 8, 1958, p. 91.

21. Told by Charles Wilson, *New York Herald Tribune*, January 6, 1950.

22. *BusinessWeek*, January 27, 1951.

23. Kahn.

24. Walter Sachs.

25. Kahn.

26. Sachs, p. 203.

27. The sixteen other banking houses named as defendants were Morgan Stanley & Co., Kuhn Loeb & Co., Smith Barney & Co., Lehman Bros., Glore Forgan & Co., Kidder Peabody & Co., White Weld & Co., Eastman Dillon & Co., Drexel & Co., First Boston Corp., Dillon Read & Co., Blyth & Co., Inc., Harriman Ripley & Co., Stone & Webster Securities Corp., Harris Hall & Co., and the Union Securities Corp. Attorneys from ten eminent law firms represented the various defendants, spearheaded by Arthur Dean of Sullivan & Cromwell, Ralph Carson of Davis Polk Wardwell Sunderland & Kiendl, and William Dwight Whitney of Cravath, Swaine & Moore.

28. Continental Can, B.F. Goodrich, McKesson & Robbins, Lambert Co., and Madison Square Garden (for all of which he also served on the executive committee), plus General Foods, Sears Roebuck, National Dairy, Cluett Peabody, and General Cigar. Weinberg averaged 250 meetings a year for twenty years.

29. Revered as the man to see even two decades later, Sidney Weinberg was called on by Dan Lufkin in 1959; Lufkin wanted to tell him about his plan to form a new firm—Donaldson Lufkin & Jenrette—and sought Weinberg's advice. "I won't say you can't do it. And I won't say you won't make it. But getting people to change the firm they rely upon for the money they need is at least as hard as getting people to change their religion. You'll have a long, long road ahead of you and you will have to do everything right to earn the reputation you'll need to have with each organization you want to

be a client." Then he added knowingly: "And the competition on Wall Street is tough."
30. Kahn.
31. Mrs. Weinberg died in 1967. Treasury Secretary Henry Fowler flew from Greece to attend her funeral, and then flew back to Greece.
32. *New York Times,* August 1, 1969.

Chapter Four
Ford: The Largest IPO

1. E. J. Kahn Jr., "Profile: Director's Director," *New Yorker,* September 8, 1956, pp. 50–54.
2. Ibid.
3. The work of Ted Yntema, the CFO, and his successor, Ed Lundy. The complete—and completely private—practice annual reports were produced for several years.
4. Blyth later merged with Eastman Dillon, which merged into PaineWebber, which sold out to UBS.

Chapter Five
Transition Years

1. Whitehead tells this charming story about an experience while stationed in Scotland for D-day training: "On my first night off, I stopped at a little store near the boat landing to buy a newspaper, always a scarce luxury aboard the ship. There was a very pretty girl behind the counter. Her name was Nanette MacGregor. She was seventeen and I was twenty-one. We struck up a conversation and she invited me home for dinner. She had a wonderful family: parents and two younger brothers. A little home cooking was very welcome after several months of navy fare. And so for about a month, I spent my liberty evenings with Nanette. She was very sweet. We'd talk about the war and what we hoped to do with our lives. I grew very fond of her, but it was a pure and platonic relationship. I continued to feel committed to Anne Burnett [whom he had begun dating in college], whose picture was on my bureau on the ship.

"Al MacIntyre had a very different experience on his shift. He met up with a girl who couldn't wait to get to the hotel room in Glasgow. According to Al's reports at breakfast, she was quite insatiable. He said that he'd never before seen anything quite like it, even though he'd gone to Princeton. He actually lost weight because they never got around to dinner. One day, after about a month, Al arrived at breakfast looking particularly badly. I asked him what was wrong. He replied, 'Nanette got drunk and passed out, and I finally had to leave her in the hotel room to get back to the ship on time.'

"'Who did you say?' I asked. 'Nanette,' he replied. 'That's the name of the girl I've been seeing." My heart sank. 'What's her last name?' I asked, and he replied, 'MacGregor.' I could not believe we'd both been seeing the same girl, but as we exchanged more information, we both knew it was true. That night was my last liberty night and I caught the train to Glasgow. Neither of us ever saw her again."
2. Coming out of HBS, Whitehead had two choices on Wall Street: joining Goldman Sachs or joining Equity Corporation with David Milton, who was married to the Rockefeller brothers' sister, Mary.
3. John C. Whitehead.

Chapter Six Gus Levy

1. His widowed mother failed in her hope of marrying one of the daughters to a wealthy European and felt she couldn't face staying in New Orleans, so she moved to the Bronx, where she worked as a seamstress and depended in later years on her son for support.
2. A cousin of Bernard Baruch who adopted a different spelling.
3. Walter Sachs.
4. Janet Wolf Levy's father was a limited partner in Goldman Sachs from 1935 to 1945.
5. Sachs, p. 59.
6. Ibid.
7. Menschel began in 1952 by joining his uncle, who was a floor specialist. "My parents were very pleased: Here I was, twenty-three years old, fresh out of Syracuse University and already a member of the New York Stock Exchange! And my uncle, who had no sons, was also pleased. He taught me the business."
8. Members of the committee included John Whitehead, John Weinberg, George Doty, Ray Young, and Ed Schrader.
9. Michael C. Jensen, *The Financiers* (New York: Weybright & Talley, 1976).
10. Carl H. Tiedemann of DLJ.

11. Among his many other philanthropic commitments, he was treasurer of American Friends of Canada, president of Jewish Philanthropy of New York, treasurer of the International Synagogue at JFK Airport, trustee of the Jewish Museum, trustee of Fordham University and Reed College, and on the Board of Visitors of Tulane University. He received honorary degrees from Syracuse, Tulane, and Mount Sinai School of Medicine.
12. Levy was also chairman of Mount Sinai Medical Center and the Mount Sinai School of Medicine.

Chapter Seven The Wreck of the Penn Central

1. At the time of Penn Central's bankruptcy, total commercial paper outstanding by all issuers was nearly forty billion dollars. Commercial paper came in two types. The larger part was issued directly to investors by giant finance companies like GE Credit, GMAC, and Ford Motor Credit, and $17.8 billion was issued by industrial corporations through commercial paper dealers, of which Goldman Sachs was the leader.
2. Goldman Sachs filed a creditor claim with its insurance company for $87.5 million.
3. Jonathan O'Herron, who had been at the Buckeye Pipe Line subsidiary. *Forbes*, December 15, 1973, p. 22.
4. Robert E. Bedingfield, "SEC's Study of Pennsy," *New York Times*, August 8, 1972, p. 41.
5. Paul A. Gorman.
6. "High Cost Money Hurts the Penn Central," *BusinessWeek*, June 6, 1970. By December 31, 1969, on a consolidated basis Penn Central's long-term debt (including obligations due within one year) was $2.6 billion. Of this, almost one billion dollars was due as payments of principal during the next five years. Payouts of $228 million were due in 1970, $156 million in 1971, $172 million in 1972, a staggering $270 million in 1973, and $160 million in 1974. Making this future even bleaker was the Penn Central's increasing difficulty in borrowing more money to refloat this debt, because there was so little unencumbered collateral left. As the Penn Central prospectus noted: "Substantially all investments and properties included in the balance sheet and substantially all properties of the transportation company . . . have been pledged as security for loans."
7. Actually a subsidiary called Pennsylvania Company.
8. It was hardly normal for a railroad whose chief predecessor companies at one time were gilt-edged investments to borrow short-term Eurodollars and Swiss francs or borrow by issuing commercial paper. Even more unusual, neither the Pennsy nor the Central—unlike a majority of U.S. railroads—had ever before been through the wringer of bankruptcy proceedings. One result was that the Penn Central had never simplified its complex debt structure. It was, instead, a maze of bonds issued by some sixty subsidiary railroads, leased lines, affiliates, and other properties.
9. "The Penn Central's Misguided Gamble," *BusinessWeek*, June 27, 1970.
10. Michael C. Jensen, *The Financiers* (New York: Weybright & Talley, 1976).
11. On February 4, 1970, Goldman Sachs officials were "shocked . . . into immediate action," according to "Goldman Sachs Ordered to Pay," *Wall Street Journal*, December 30, 1970, p. 11.
12. H. Eric Heinemann, "Goldman Sachs Is Sued," *New York Times*, November 17, 1970, p. 63.
13. Including one brought by American Express, which had declined to participate in the November 1970 lawsuit, for $4.8 million, and one by Fireman's Fund for $1.9 million.
14. Peat Marwick Mitchell, the accounting firm named in the action, said in its statement that "the commission has before it no credible evidence which justifies action against the firm" and asserted, "The commission, once again, has seen fit to include auditors in its apparent program to offer scapegoats to the public."
15. In general, a consent agreement is an administrative decision expediting the disposition of cases involving alleged violation of federal securities laws. Although binding on the defendant because of the court's participation, it is not an adjudication because nothing has to be proved or disproved. It is similar to, but not the equivalent of, a plea of nolo contendere, since no admission or denial of charges is made, but usually grows out of an offer by the defendant to settle.
16. "Fraud at Penn Central?" *Newsweek*, May 13, 1974.

17. "Heavy, Heavy," *Forbes*, August 15, 1971.
18. Deposition read in Southern District Court of New York on September 12, 1974.
19. Southern District Court Reporter's transcript, p. 1459 for September 23, 1974.
20. Dun & Bradstreet won dismissal of a suit by Mallinckrodt Chemical charging fraud and negligence in NCO's giving Penn Central a prime rating. The court concluded that NCO had acted in good faith and had sent copies of Penn Central's poor earnings reports at year-end 1969.
21. Robert J. Cole, "Goldman Sachs Loses Case," *New York Times*, October 10, 1974, p. 69.
22. "Goldman Sachs Is Said to Pay," *Wall Street Journal*, March 20, 1975, p. 20.
23. "A Suit Is Averted," *New York Times*, March 22, 1975, p. 41.
24. "Goldman Sachs Ordered to Pay $500,000 in Suit Tied to Penn Central Collapse," *Wall Street Journal*, December 30, 1975, p. 4.
25. "Goldman Sachs Wins Suit," *Wall Street Journal*, June 14, 1976, p. 10.
26. "U.S. Appeals Court Overturns Ruling," *Wall Street Journal*, August 12, 1976, p. D-7.
27. The other 15 percent of the stock would be owned by Conrail employees through an employee stock ownership plan (ESOP).

Chapter Eight Getting Great at Selling

1. After graduating from the University of Pittsburgh, where he studied finance and accounting, Young had gone to Harvard Business School with 240 others in the accelerated program run for the navy. Derwood "Dee" Algar headed sales before Young became a partner in 1958.
2. In 1960, when the firm had 550 people, sales had seventy-four, with thirty-six of them over fifty.
3. Dick Menschel graduated from Syracuse, where he managed the humor magazine; joined the air force; then, with polio, spent eight months at Walter Reed Hospital and Warm Springs, Georgia, before going off to Harvard Business School and eventually joining Goldman Sachs in 1959. He held management roles thereafter. "My first assignment was a real break: working on the issuance of the Federal Street Fund under Mr. Weinberg." The "deal book" for that offering half a century ago sits on the credenza in Menschel's office. In 1968 Menschel became partner in charge of the institutional sales department, selling both stocks and bonds.
4. Mnuchin had joined Goldman Sachs in 1957, straight out of Yale and the army. A champion bridge player with superb card sense, he was almost predestined for Levy's trading desk. "I always knew I wanted to be a trader," he recalled, "even though I didn't know anybody in Wall Street or anything about trading. After Yale and two years in the army as the most undecorated soldier in history, I went to Goldman Sachs, where Gus hired me." (Levy knew Mnuchin's father, a lawyer, through philanthropic work.) Told to report a few weeks later on a specific day at 8 a.m., Mnuchin went in at seven thirty hoping to get off to a good start and make a favorable impression. No such luck. "Gus had forgotten all about hiring me. But he was quick on his feet and said, 'You'll work in bonds for now.'" Mnuchin quickly figured out the real reason he was assigned to bonds: "That had to be because all the seats in equity trading—seven on one side and seven on the other side of the trading desk—were already assigned." After thirty-three years at Goldman Sachs (and earning $8.7 million in his final year), Bob Mnuchin left in 1990 and with his wife, Adriana, renovated and opened the luxurious Mayflower Inn in rural Connecticut. In addition, he built a major art dealership and she developed two retailing chains—Tennis Lady and Cashmere, Cashmere.

Chapter Nine Block Trading: The Risky Business That Roared

1. Managed by Jack Meyer, who went on to head investments at the Rockefeller Foundation and then to head investments at Harvard before establishing his own investment firm, Convexity Capital.
2. At the same time, the New York City pension fund, which had a disproportionate holding in the "Big Mac" bonds created to deal with the city's fiscal crisis—tax-exempt bonds in a tax-free portfolio—was selling those bonds in a wonderfully imaginative way. It conducted highly visible competitive-bid sales of fifty-million-dollar tranches of the bonds to the best bidder among a

group of major banks. All these sales were well covered by the press. Then, using that "fair pricing," the fund sold billions of those same bonds in strict secrecy to large insurance companies.

3. Two firms specialized in odd-lot retail transactions of less than one hundred shares to accommodate smaller trades made by numerous small retail accounts, packaging orders of fewer than one hundred shares into one-hundred-share round lots.

4. Truman Bidwell, a day trader at the NYSE, encouraged both Goldman Sachs and Donaldson Lufkin & Jenrette to engage in block trading. Dick Jenrette recalls, "Biddie came to me because we were both members of Chi Psi fraternity and explained how we at DLJ could do a very good business—at the old fixed-rate commissions—if we would commit a moderate amount of capital to 'inventory' or 'position' blocks of stock or, more often, parts of blocks when the other side was not fully available at that time and at that price." DLJ, Bear Stearns, and Shields & Co. joined in the business, but Goldman Sachs was always the clear leader.

5. Reciprocal business—called "recip" in the jargon of Wall Street—soon resolved into semiformal arrangements at understood rates, such as the equivalent of 8 percent interest for demand deposits maintained at banks or 6 percent of the value of mutual fund shares sold—with both sides keeping close track of the amounts of commission business promised and paid.

6. Sam Stayman, inventor of the Stayman Convention in bridge and one of the managing partners at Strand & Company, a hedge fund, and a friend and bridge partner of Mnuchin's, agrees: "There's a great similarity between trading and duplicate bridge tournaments. In tournaments, you have to imagine what's happening at the other tables, have a feel for the psychology of the situation at the moment, and Bob can do the same with markets."

7. *Institutional Investor,* October 1971, p. 53.

8. Ibid.

9. Ibid.

10. Who went on to be the powerful treasurer of the World Bank.

Chapter Ten Revolution in Investment Banking

1. Admission to partnership required Whitehead to put up five thousand dollars, which, as the firm knew, was all the capital Whitehead had.

2. Weintz recalls that after serving in the air force, "I knew from my years at Norwich Academy, an all-boys school in Vermont, that college for me had to be two things: coed and in a warm climate. So I went to Stanford. Then into sales with Vicks VapoRub. I was very good at it, but it wasn't the career for me. Still, it was great training before going on to the Harvard Business School. Coming out of HBS, I wasn't sure what to do next, but a classmate, George Strong, urged me to interview with Goldman Sachs, saying, 'It'll be great practice for you because they're *very* thorough.' So I did and met [partner] Vern Horton, who had a great personality, and we hit it off well. This was even after he asked me if I'd taken any finance courses and, when I told him which ones, he'd asked, 'They're required, aren't they?' and I'd sheepishly said yes. Anyway, they invited me down, and I agreed because at the very least it was a free trip home. One Saturday morning, I was told, 'General Doriot wants to see you!' I ran right over with no shave and no tie. [Georges Doriot, an austere Frenchman, had served in U.S. Army procurement during World War II and, while a popular and influential professor at Harvard Business School, continued to use his military title.] "Doriot hit the roof when he saw me so disheveled and promptly sent me back to my dorm to get shaved and dressed. He'd been called by Goldman Sachs to ask what he thought of me. Doriot was not at all keen on Wall Street but acknowledged it would be useful to 'have a few of my boys down there' and encouraged me to go. During the next few weeks of job interviewing, Goldman Sachs was *everywhere*. I interviewed at Owens Corning Fiberglas—with Jim Weinberg. At U.S. Steel, I interviewed with Bay Estes, who had been at Goldman Sachs. And it was the same at another place. I called my father and said, 'Dad, this Goldman Sachs is really wired in. They're really in on what's going on.' So I joined Goldman Sachs in 1954 at $4,200."

3. *Institutional Investor,* June 1987, p. 29.

Chapter Twelve
The Two Johns

18. *Financial Times,* January 18, 1993, p. 31.

Chapter Thirteen
Bonds: The Early Years

1. And father-in-law of partner Roy Smith.
2. With Jim Gorter, Henry Fowler, Richard Menschel, Ray Young, and Levy.
3. Simon was offered the same 5 percent of the partnership that Weinberg and Whitehead then had.
4. After graduating from Dartmouth in 1961, Downey went into the army and then joined Liberty Mutual in sales before moving to R.W. Pressprich.
5. Not all niches were created equal: There was a strong negative public reaction against large corporations getting a tax break by doing huge industrial revenue bond financings—U.S. Steel had a one-billion-dollar issue—and in 1968, such financing was prohibited except for pollution-control projects. However, as Whitehead correctly anticipated, "There will be other types of municipal financing."
6. Michael Mortara in mortgages was a stellar exception: He accepted and was accepted by Goldman Sachs and became a major contributor until his premature death in 2000.
7. The Black-Derman-Toy model used the binomial tree framework of the Cox-Ross-Robertson model for valuing equity options.
8. Emanuel Derman, *My Life as Quant: Reflections on Physics and Finance* (Wiley, 2004), p. 285.

Chapter Fourteen Figuring Out Private Client Services

1. Goldman Sachs had been in the individual or retail brokerage business since the late 1940s—but with little volume. In those days, one hundred thousand dollars of gross annual commissions with a payout to the salesman of thirty thousand dollars was considered good business.
2. Compensation was changed from a share in commissions generated—which had encouraged transactions and turnover—and linked to asset-management fees. While it would take time to build a base of business large enough to generate comparable income for the individual salesman, the rearrangement aligned individual incentives with the firm's business objectives. Personal incomes and firm profits both rose. Private wealth advisers, as they were now called, could concentrate on the core decision—setting the right asset mix—for each investor and leave the complexities of continuous implementation to investment specialists. This division between marketers and execution specialists, so reminiscent of John Whitehead's revolutionary restructuring of investment banking, converted PCS from an

"eat what you kill" hunter business to a sustained "agricultural" business that contributed steady, highly valued fee-based earnings in time to make an important positive contribution to the success of the firm's IPO.

3. Born into a lower-middle-class family in Buffalo, Dan Stanton lost his father when he was four years old. His mother became a high school teacher and put herself through law school, became a state attorney general and a judge, and eventually served on the New York State Supreme Court. Dan went to a Jesuit college, sold encyclopedias for Britannica, earned an MBA at Columbia, and got a job at Goldman Sachs in 1981.

Chapter Fifteen J. Aron: Ugly Duckling

1. Trading in interest-rate futures began in 1975 and developed slowly in the first few years.

2. Tom Israel of A.C. Israel & Co., a commodities firm.

3. Customers were given code names or account numbers because the central banks of major countries insisted on privacy and everyone knew that an employee might, intentionally or unintentionally, tell somebody something somehow about a major country's monetary secrets.

4. The imperfection in the hedge was that London gold bars weighed four hundred ounces, while New York or Comex bars weighed one hundred ounces, so there was a small specific risk of having to pay a premium price to convert from one size to the other.

5. Metallurgy Hobshen of Belgium.

6. ACLI, a successor firm to A.C. Israel, was acquired by Donaldson Lufkin & Jenrette during this same period. Salomon Brothers's first major experience with commodities had come in the late 1960s when it went to A.C. Israel to get help deferring partners' taxable income. The technique arranged was to go long September "old crop" cocoa and short December "new crop" cocoa. This arrangement worked far better than expected: Not only were taxes deferred, but September cocoa went to unanticipated high prices, making a memorable profit for the partners of Salomon Brothers—and creating a very favorable view of commodities.

7. Endlich, p. 95.

8. *New York*, November 14, 1983, p. 16.

Chapter Sixteen Tender Defense, a Magic Carpet

1. After earning his MBA at Wharton in 1969, Bob Hurst joined Merrill Lynch, built up his clientele over the next five years, and became that firm's youngest vice president. In 1974, when a senior Merrill Lynch executive was transferred into investment banking and started calling Hurst's clients and acting as though he was their main banker, Hurst called Bob Conway at Goldman Sachs to say that he might be interested in a switch. Interviews were arranged with Ross Traphagen and Jim Weinberg in IBS. They went well, so Hurst met with John Whitehead. "He gave me the best 'negative' sale you can imagine, saying things—one right after another—like: 'You're doing so very well at Merrill Lynch, surely you wouldn't want to have to start all over from the bottom of the ladder at Goldman Sachs'; 'We are very reluctant to bring people in laterally, and you would be seen as an outsider'; 'You must recognize that it will take considerable time for you to prove yourself externally with the companies you'll be assigned and even harder to prove yourself internally at Goldman Sachs.' By the time Whitehead had put down all these negatives—which, of course, I assured him, challenging as they might be, I was sure I could overcome—he had me selling myself on a switch to Goldman Sachs in the most effective way!"

Chapter Seventeen The Uses and Abuses of Research

1. Bowen was an early president of the New York Society of Security Analysts.

2. After four years as an undergraduate at Columbia University and one unhappy year at Columbia Business School, Ellis got a job in research at Bank of New York under Carter Bacot, who went on to become CEO. Ellis's father was a retailer, and Joe had worked in the store, so he became a retailing analyst at BoNY. After five years at the bank and a second recruiting invitation, he joined Goldman Sachs, where he became the first analyst without managerial responsibility to become a partner. He stayed twenty-eight years.

3. Einhorn went to Rutgers and the University

of Illinois for its PhD program, but his plans for an academic career got aborted by a phone call. "I was teaching a course in investments using the textbook written by Cohen, Zinbarg, and Zeikel and was looking for a summer job. My dad knew an HR manager at Prudential and found there might be an opening in economics. One evening, I was startled by a phone call—from Ed Zinbarg, one of our textbook's authors. He was chief investment officer at Prudential. I started there and then went on to Goldman Sachs."

4. Patrick McGeehan, "Goldman Sachs Releases Stock Analyst," *Wall Street Journal*, May 28, 1999.

5. The fifty million dollars intended for investor education ran into a political squall within the SEC and got stymied. The professionals who had volunteered to serve the public interest all resigned in protest.

6. Patrick McGeehan, "Goldman Sachs Moves to Tighten Stock Analysts' Independence," *New York Times*, February 20, 2002.

Chapter Eighteen
John Weinberg

1. The IRS guidelines, structured to prevent individual investors in small companies from unfairly getting capital-gains tax treatment on distributions that were really dividends, specified exactly what constituted maintaining an investor's percentage ownership and therefore what constituted a dividend rather than the proceeds of a sale. The arrangement between DuPont and Seagram followed the guidelines precisely but achieved a result directly opposite to the IRS's expectation. Using derivatives and a time-structured agreement, the payment from DuPont to Seagram was clearly a dividend as defined by IRS guidelines. (Under Canadian tax law, which affected Seagram, the dividend was also tax-free at the Canadian corporate level.) Specifically, Seagram was paid one billion dollars in cash and $7.3 billion in ninety-day notes with equity warrants worth $440 million, and it retained 8.2 million shares. The warrants would allow Seagram to purchase forty-eight million shares of DuPont at $89 for a period of sixty days in 1997, fifty-four million shares for sixty days in 1998, and fifty-four million at $114 in 1999. Because Seagram got warrants to buy 156 million shares—exactly equal to the 156 million shares it sold—it was deemed to have maintained exactly the same beneficial equity interest in DuPont. The reality that the warrants would never be exercised simply didn't matter. Soon after the repurchase, Congress introduced legislation to change the law governing this type of transaction.

2. *American Lawyer,* November 1981. Weinberg's serving on Seagram's board of directors also precluded Goldman Sachs from engaging in lucrative arbitrage.

3. *New York Times*, August 16, 1984.

4. John Weinberg's other directorships included Knight-Ridder, Witco Chemical, McKesson & Robbins, Cluett Peabody, Cowles Communications, Bulova, General Development, Van Ralte, Capital Holding—as well as Seagram and DuPont. Weinberg also served as a charter trustee of Princeton and on the boards of Deerfield, Teachers College, New York Hospital, the Japan Society, the China Medical Board, the Economic Club of New York, and the American Arbitration Association. He was the only investment banker on the Business Council, the prestigious group organized by his father at FDR's request.

5. One cheery paternal invitation to "come for dinner and stay the night" was given without concern that the room and board would be proffered at J. P. Morgan's stately home in Washington, D.C., being used during the Korean War by Sidney Weinberg and his two senior colleagues on the War Production Board, General Lucius D. Clay and Charles E. "Electric Charlie" Wilson—or concern that the younger Weinberg was then a very junior officer in the Marines.

6. *New York Times*, August 16, 1984.

7. Robert J. Cole, "Low-Profile Leader Takes Charge," *New York Times*, August 16, 1984, p. D5.

8. Dorothy Rabinowitz, "A Cautionary Tale," *New York*, January 8, 1990, p. 35.

9. "Goldman Suffers Some Blemishes," *Wall Street Journal*, January 18, 1990, p. C-1.

10. Weinberg and his wife, Sue Anne, who studied for a doctorate at Columbia Teachers College, were married for over forty years.

11. Managing director of Sumitomo Capital Markets Inc., Kondoh was a brilliant maverick, fluent in English, and a high-ranking graduate of the elite University of Tokyo. Assigned to interna-

tional planning, he performed a key role in a two-million-dollar 1985 strategic planning exercise for Sumitomo by McKinsey & Company.
12. Morgan Stanley's market value at the time was a little higher—three and a half times book.
13. Roy Smith and Michael Coles were both on Gant's negotiating team. After going limited, Coles served as an adviser to Sumitomo's New York branch. (He gave his retainer fee to charity.)
14. Voting rights were never offered and never requested.
15. Before the first five years were up, Bob Rubin wanted to press for an extension. Don Gant would have waited longer, knowing that Sumitomo wouldn't want to lose face by having the deal come apart and believing that waiting could create time pressures that might enable Goldman Sachs to obtain more favorable terms, such as reducing the 12.5 percent to 10 percent. Rubin, Gant, and Weinberg went to Tokyo for a spectacular ceremonial dinner with Sumitomo executives, at which Rubin said Goldman Sachs would like to extend the relationship ahead of schedule. The Japanese were more than pleased.
16. Gant was well advised by Rodger Cohen, who had had an office in Japan and who later became managing partner of Sullivan & Cromwell.
17. Fifty years after the war, Weinberg recalled how harsh combat had made both sides: "The Japanese never signed the Geneva Convention on war conduct, which covered taking and holding prisoners. If you took a pillbox or something, Japanese soldiers would come out with their hands up—holding grenades behind each hand—until they got close enough that you might see the grenades and then they would throw them at your unit. The battalion commander came around saying, 'This will not be in writing, but we are not accepting any more surrenders.' We captured a group of Japanese soldiers in an old copper-mine tunnel. I went over thinking I'd sit in the shade in the tunnel. My sergeant suggested I go elsewhere. I said I'd planned to sit in the shade. I was eighteen then, too young for what they planned to do. So my sergeant says, 'Sir, get the fuck away from here!' And off I went. My gunnery sergeant was a real old-corps Marine who asked me one day if I'd ever killed a guy. "Not that I know of." So my sergeant tells me that won't do and sets up to change it. I was a pretty good shot in those days . . . so it didn't take very long."
18. Weinberg joined the Marines in World War II as a private, rising to second lieutenant. Called back to service in the Korean War, he mustered out as a captain. At his funeral, the honor guard folded the American flag into the traditional perfect triangle for presentation to Sue Anne Weinberg. The recessional was the "Marines' Hymn."
19. Weinberg's home was in the nearby town of Greenwich.
20. *Economist*, September 29, 1990, p. 93.

Chapter Nineteen
Innocents Abroad

1. Brown's father had been in the Occupation forces, so he grew up speaking Japanese. He joined the Jesuits, who sent him to teach and learn economics at Harvard Business School, but in Boston he met a Japanese woman who was studying at the New England Conservatory of Music, fell in love with her, left the church, and joined Citicorp, where he worked in a joint-venture consulting company with McKinsey.
2. Coles was born in England, skipped college, flew in combat in Korea for the Royal Navy, fell in love with an American, and applied to and was accepted by Harvard Business School before joining Goldman Sachs.
3. Four years later, the firm had three times as many people—180—and was moving into offices in the Old Bailey office complex.
4. Established as First International Bank Ltd. in 1973 by the First National Bank in Dallas, the unit had been one of the more aggressive UK merchant banking subsidiaries of a U.S. commercial bank until reined in by its parent in 1979, which caused several senior people to quit. When acquired by Goldman Sachs, it had a dozen employees and loans outstanding of only forty million dollars.
5. After Big Bang, J.P. Morgan nearly acquired Wood Mackenzie but called off their deal at the altar. Wood Mackenzie subsequently merged with the merchant-banking firm Hill Samuel & Company, and the merged firm was later combined into NatWest Securities, the stockbroking arm of National Westminster Bank.
6. Another strategic opening not taken can be

traced back to Whitehead's experience at Haverford College. Edmund Stennis left Germany in the early thirties because he was so opposed to Hitler and taught at Haverford College, where his students included Whitehead, who recalls that Stennis rebuilt his family fortune through astute investing while teaching. As Whitehead explains, "Stennis had contributed about one-third of the capital Siegmund Warburg needed to launch New Trading Company—which fledgling firm later became S.G. Warburg & Company—so it was not surprising that Stennis introduced me to Siegmund Warburg. We became good friends and I visited him several times at his home in Switzerland. Siegmund maintained in public that he'd retired from Warburg's, but he actually kept very tight control with telex instructions on very specific operational matters—three times every day."

Goldman Sachs might have combined with S.G. Warburg: One firm was the leader in the United States but not significant in the UK; the other firm was powerful in the United Kingdom but not in America; Neither was strong on the European Continent—and both needed to become strong in each other's market to be truly "international." Whitehead explained why that didn't happen: the subject "had never been even considered because we just don't believe in expanding through acquisitions. Besides, we would have had problems with their having several quite powerful but much, much older partners. Also, they have a tendency, as we saw it, toward what might be patrician to some, but to others could seem like arrogance. Slow and cautious we may well be, but we always want to build up our own, one step at a time."

7. Mulvihill was the same "uncle" who advised younger stars: "Weddings, bar mitzvahs, and funerals are all once-in-a lifetime events in the employee's life. Go to every one you possibly can—and always get there at least fifteen minutes early, so you'll have plenty of time to make friendly small talk with the other people who care too."

8. Ward and Mayhew later became friends. Mayhew's son got a job at Goldman Sachs and Ward spent weekends at Mayhew's country home. Knowing Mayhew was an old Etonian but not a college graduate, Ward decided on another occasion to have some fun with him. "What did you study at Cambridge, David?"

"I didn't go to Cambridge," came the quick, quiet reply.

"Oh, not Cambridge. Well then, what was Oxford really like?"

"I didn't go to Oxford," came a still quieter reply, and then, in a combination of apology and drawing a "do not cross it" line in the sand, Mayhew went on: "In my day, most young boys did not bother going to university."

Chapter Twenty-one How BP Almost Became a Dry Hole

1. The market fell 12.8 percent on October 28, 1929, "Black Monday," the worst single day of the 1929 crash.

2. James Hanson, chairman of Hanson Trust, had secretly called on Chancellor of the Exchequer Nigel Lawson at No. 11 Downing Street in May 1985, offering to buy the whole block of BP. Lawson declined, explaining that a wide shareholding would be sought, not a single buyer.

3. Nigel Lawson, *The View from No. 11*, p. 758.

4. Two smaller government companies had already been privatized: Amersham for seventy-one million pounds, followed by Britoil for £549 million.

5. Clement Attlee's Labour government gave five reasons for nationalization in 1945: improve labor relations; promote full employment; increase productivity; make regulation of monopoly more efficient; and replace short-term expediency with broader national priorities.

6. Most British underwriters kept 5 percent of their total participation; BP's advisers—Rothschild and S.G. Warburg—kept 10 percent. Schroders's loss on its £10 million underwriting was only a very tolerable £1.5 million.

7. Lawson, *View from No. 11*, pp. 774–75.

8. The Labour Party's spokesman had apparently resolved in advance to attack Lawson's decision; he evidently had been led to believe Lawson would simply defer the matter. Surprised by Lawson's announcement, he immediately reversed his own argument, saying the issue should have been postponed and opening himself up for a classic parliamentary putdown as Lawson, who knew Gavyn Davies had worked in the past for Labour,

mocked him in swift reply: "The Labour Party today is simply the friend of Goldman Sachs!"
9. The same accounting treatment was used for the Maxwell settlement and for the fine in the so-called Analysts settlement.
10. Lawson, *View from No. 11*, p. 275.

Chapter Twenty-two
Changing the Guard

1. Rubin had a subtle, graceful style and a quirky sense of humor that had special meaning for the brilliant young people who worked with him. Some of the most treasured stories were trivial in substance but not in their meaning to the insiders. For example, Rubin and Brosens often shared a cab uptown. Rubin always got out first and always paid the fare, tipping generously. One night, Brosens protested that he should at least split the fare. Rubin shook his head. Smiling, Brosens reached into his pocket and pulled out a quarter, which he ceremoniously presented to Rubin, who looked at it solemnly, paused, and then observed quietly with exaggerated ceremony, "You're overpaying me," and then paused again before saying, "Let me think about that." After a still longer pause, he came to his considered, final conclusion: "No. that wasn't really right. You wouldn't be overpaying me. You'd be *way* overpaying me"—and smilingly piled out of the cab.
2. Linda Sadler, "Goldman Is Being Aggressive," *Wall Street Journal*, January 9, 1985, p. 4. The market-share numbers came from Securities Data.
3. Rich Friedman (no relation) was the operating head of the unit.

Chapter Twenty-three
Transformation

1. Fischer Black had understood the power of technology in trading securities early, and in 1971 wrote a prescient paper: "Toward a Fully Automated Exchange."
2. Black and Scholes wrote a paper in 1973 showing both their derivation and Merton's, but it was so arcane that professional journals repeatedly rejected it until, after several years, Merton helped them get it published.
3. Partly at the suggestion of Jack Treynor, who had known him at Arthur D. Little.
4. Perry Mehrling, *Fischer Black and the Revolutionary Idea of Finance* (John Wiley & Sons), p. 219.
5. Mehrling, *Fischer Black*, p. 12: Svi Bodi interviews with Fischer Black in July 1989.
6. Stanley Diller, former professor at Columbia Business School, made a similar contribution in fixed income.
7. In February 1990, Black moved over to the fixed-income management group in GSAM, and in late 1992 he moved to fixed-income research.
8. Mehrling, *Fischer Black*, p. 241.
9. Ibid., p. 284.
10. Ibid., p. 97.
11. The arithmetic average of 1 and 3 is $(1 + 3)/2$, or 2, while the geometric average of 1 and 3 is $(1 \times 3)/2$, or $1\frac{1}{2}$.

Chapter Twenty-four
False Starts in Investment Management

1. Capital Group Companies manages the American Funds group of mutual funds for individual investors, Capital Guardian Trust for institutional accounts, and Personal Investment Management Services for wealthy-family funds. Capital Group Companies is one of the world's largest and most capable investment-management organizations. (See my book, *Capital*, published by John Wiley & Sons, 2004.)
2. Later, in the 1980s and 1990s, Merrill Lynch, Morgan Stanley, and Credit Suisse First Boston each built a large investment management business.
3. Later James Coxon came over from London to head up sales. He did do some successful selling.
4. Anise Wallace, "New Division Is Planned by Goldman," *New York Times*, May 9, 1989, p. D5.
5. Michael Siconolf, "For Just $1,200, You Too Can Be Goldman Client," *New York Times,* April 6, 1990, p. C-1.
6. Barbara Donnelly, "Goldman Offers Fund of Its 'Top 50' Picks," *Wall Street Journal*, June 21, 1991, p. C-1.
7. McNulty nearly went to another firm when he came out of Wharton. "Do you have any plans?" asked George Ross, head of Goldman Sachs's office in Philadelphia and a repetitively successful

recruiter of Wharton's best MBAs. It was a Sunday afternoon. "Yes, I'll be joining Salomon Brothers on Monday," said McNulty. Stormed Ross in reply: "I'll be goddamned! No way! You be near your phone tonight, ready for a call!" Later that evening Ross called to say he had talked with Richard Menschel and he was now making a firm offer. McNulty accepted and joined PCS to work in Florida. "Goldman Sachs had a very special feeling about it. Joining was like coming home. The work was a true vocation."

8. Smirlock paid the SEC a fifty-thousand-dollar fine to settle the charges.

Chapter Twenty-five Robert Maxwell, the Client from Hell

1. Maxwell had a twenty-million-pound life insurance policy underwritten by several Lloyd's of London syndicates. The policy would not pay off if death were due to natural causes, such as a heart attack, but would be triggered if death were due to an accident or murder. Dr. Iain West, head of forensic medicine at a London hospital, prepared the British pathologist's report.

2. Gordon Thomas, *Gideon's Spies: The Secret History of the Mossad* (New York: St. Martin's Press, 1999), p. 219.

3. Nick Davies, *Death of a Tycoon* (New York: St. Martin's Press, 1992), p. 339.

4. The terminology used by British regulators.

5. In late 1985, Maxwell acquired a substantial stake in Britannia Arrow (previously called Slater Walker Securities), which had acquired the investment firm MIM from Aetna. Britannia Arrow later acquired Invesco Capital Management. The investment firms were combined and took the name Invesco MIM PLC in early 1990.

6. Department of Trade and Industry, Report, 1974, p. 7. Under British law, the pension funds were not required to have trustees.

7. Ibid.

8. Ibid., p. ix.

9. Maxwell organized Bishopsgate Investment Management, whose sole business was managing the MCC and Mirror Group pension funds. All but one of BIM's directors were directors of Maxwell's private companies. Inexplicably, Britain's Investment Management Regulatory Organisation licensed Bishopsgate under the Financial Services Act of 1986, which is why Maxwell had access to the funds' assets. As a result, the British government arguably had a moral responsibility to recover the funds lost or purloined.

10. Ibid., p. xv.

11. Ibid., p. xvi.

12. Only arm's-length transaction business was to be done. Goldman Sachs was not to act as an agent for Maxwell, and he was not to be a client of the firm.

13. Peter J. R. Spira, *Ladder and Snakes* (privately printed, 2005), p. 280.

14. His talent as a trader was real. In 1991, when the Vuitton family wanted to sell a $320 million block of LVMH shares, their traditional banker, Banque Paribas, offered to buy the shares at a discount, but Sheinberg won the trade by bidding at the market. He then outmaneuvered short-sellers by buying two hundred million dollars more shares and then, as the shorts bid up the price to cover their short positions, reselling to institutions on the basis that a premium was justified by the unique company, its unique value, and a unique opportunity to obtain good-size positions. Sheinberg played his cards skillfully—and, as a trader, made a profit of over ten million dollars.

15. Department of Trade and Industry, Report, 1991, p. 25.

16. John Mason, "Maxwell Trial," *Financial Times*, September 23, 1995, p. 6.

17. Fife's personal share of the settlement was four million dollars. Reserves—at a larger amount—had been taken in 1991, 1992, and 1993, so charges would have to be shifted back and changed to the correct amount now that the settlement had been set at $254 million.

18. Anita Raghavan, "Goldman Sticks to Plan on Allocating Settlement Lost," *Wall Street Journal*, April 14, 1995.

19. Norma Cohen, "Sheinberg Steps Down," *Financial Times*, November 29, 1994, p. 30. Mirror Group Newspapers's pension fund trustees filed lawsuits in New York seeking fifty-seven million dollars from both Sheinberg and Goldman Sachs. As the *Wall Street Journal* reported: "Despite the fine, Goldman tried to distance itself from the Maxwell matter. 'The regulatory glitches have nothing to do with Robert Maxwell,' said

Gregory Palm, a Goldman partner and co-general counsel. 'They really aren't Maxwell related,' he said. 'They were back-office accounting and computational errors that had nothing to do with who was on the other side of the trade.' He added: 'In any transaction of the same type, the same problem could have arisen.'" The Financial Services Authority's disciplinary order specified that "SFA did not conclude that Goldman Sachs or any of its personnel participated in any illicit conduct with, or were aware of illicit conduct by, Maxwell or any entity controlled by or associated with him."

20. Michael Siconolfi and Nicholas Bray, "Britain Orders Goldman Sachs to Pay a Penalty," *Wall Street Journal*, June 17, 1993, p. A-6.

21. DTI Report, p. 28.

22. G. Rascal Zachary, "Goldman, Coopers Are Cited in Report on Maxwell Collapse," *Financial Times*, April 2, 2001.

23. "Maxwell Trial: Goldman Sachs May Have Wrecked Deal," *Financial Times*, October 19, 1995, p. 11.

Chapter Twenty-six Making Arbitrage a Business

1. Calm and smooth as he usually was, Tenenbaum was not *always* detached. On occasion, Tenenbaum's frustrations reached overload and he showed a terrific temper—once pulling the telephone out of the wall and throwing it across the trading room.

2. Robert Rubin grew up in Miami, Florida, and came to Goldman Sachs after Harvard College, London School of Economics, Yale Law School, and two years of practicing law at Cleary Gottlieb.

3. During the 1970s—as the stock market averages fell, inflation rose to record highs, underwriting volume plunged, and profitability on Wall Street dried up—most of the other firms cut back on arbitrage, but Goldman Sachs got even more active. With almost no real competitors, it nearly had the market—and the profit opportunities—to itself.

Chapter Twenty-seven J'Accuse

1. Lisa Endlich, *Goldman Sachs: The Culture of Success* (New York: Little Brown, 1999), p. 113.

2. James Buchan, "Handcuffs on Wall Street," *Financial Times*, February 16, 1987.

3. "Suspicious Trading," *Wall Street Journal*, February 12, 1988, p. 1.

4. By selling and promptly rebuying, Freeman effectively deferred settlement by a few days while maintaining his position. The "financing" cost him one-eighth of a point in price change and would lead to a massive change in his life.

5. Siegel was the first in his family to go to college, determined to advance as far and as fast as possible and not repeat his father's going bankrupt at forty-seven. Robert Siegel and his brother had owned three shoe stores serving a middle-class market near Boston. They struggled to survive as retailers of American-made shoes in competition with low-cost imports and efficient chain operations.

6. Siegel was close with Ivan Boesky, investigators found. He had invited Boesky to play tennis in the spring of 1982. Boesky arrived in a pink Rolls-Royce. When Siegel, then thirty-four, expressed concern about the future of his firm and said he was sure it was cramping his own business, Boesky offered a position in his firm, Ivan F. Boesky & Company. Boesky called that summer and invited Siegel to meet at New York City's Harvard Club for a drink. Guiding the conversation to personal finances, Boesky renewed his job offer. Siegel demurred but had an alternative: He could consult to Boesky on possible takeover situations and earn consulting fees on the side or a year-end bonus. Both men knew just what they were saying, without being explicit. Since Boesky was such an active trader in so many stocks, Siegel's tips would be easily mixed in with Boesky's other trading and go unnoticed, particularly if the trades were done well in advance of any specific deal. "Let's have coffee" became their telephone signal for a personal meeting.

7. Other call holders in the arbitrage department agreed and sold too. One arbitrageur was away that day and did not sell: Bob Rubin.

8. Sarah Bartlett, "A Top Trader at Goldman Sachs Pleads Guilty," *New York Times*, August, 1987, p. 1.

9. In a case involving Equity Funding and an analyst named Ray Dirks, who first identified a massive fraud, the SEC argued that when

an expert got an apparently innocuous piece of data that he could fit with other pieces to form a decisive insight, he had made himself an insider. The Supreme Court rejected this approach for outsiders with no fiduciary responsibility to the corporation.

10. James B. Stewart, *Den of Thieves* (Simon & Schuster, 1991).

11. Levine was, in fact, typical of the people who lie, cheat, and steal in various fields: counterfeiters of papal bulls in the Middle Ages, scientists who falsify data on experiments to get publishable results, housewives who cheat on their husbands, and citizens who play games on expense reports or on income taxes. Deceivers typically focus on their own immediate gain and deny or discount the penalties and percentages of getting caught, wrapping themselves and their thoughts in private delusions. While each delusion is singular in its details, they follow an intriguingly consistent pattern. Most get involved gradually, never quite recognizing or admitting to themselves that they have broken their own promises or have broken the norms of the community in which they live. Most deceivers are new to their community—which is partly why most feel so little loss in flouting community rules. They have little invested in their connections with the established norms, the reasons the norms were established, or the reasons for adhering to them.

12. *New York Times,* January 10, 1986.

13. James Sterngold, "Goldman Aide Tied to Insiders," *New York Times,* October 9, 1986.

14. *The Economist*, February 21, 1987, p. 81.

15. Endlich, *Goldman Sachs,* p. 118.

16. Confirmed recently directly to the author by the then head of investment banking at Kidder Peabody and the then CEO of Drexel Burnham.

17. *Den of Thieves,* p. 155.

18. Boesky's total position of 1.8 million shares worth $42 million was four times the peak position at Goldman Sachs.

19. Christopher Byron, *New York* magazine, September 1989.

20. Edward Oakley Thorp, *Beat the Dealer* (New York: Blaisdell, 1962).

21. "Small Securities Firm Links Drexel's Milken, Goldman's Freeman," *Wall Street Journal*, April 6, 1988, p. 1.

22. Thorp was never involved in or even aware of the activities that were questioned. His office was in Newport Beach, two thousand miles away from Princeton. Thorp was engaged in quantitative research and the development of sophisticated investment ideas.

23. "Freeman's Attorney's Battle," *Wall Street Journal,* November 28, 1989, p. B14.

24. Laurie P. Cohen and Milo Geyelin, "Freeman Sentenced," *Wall Street Journal,* April 18, 1990.

25. Freeman tutored and coached basketball at Boys Harbor Inc., a social-service agency in East Harlem, New York. He was free to act as an unregistered investment adviser and, after three years, to act as a registered investment adviser.

Chapter Twenty-eight
Building a Global Business

1. Fife had offered to go two years before, but Bob Conway got chosen. Then Fife's first wife died after a long struggle with a virulent cancer. Jim Gorter raised the question of Fife's going to London as the two men were driving away from the meeting at which they had arranged the sale of Bank of America's headquarters building for $555 million—a price chosen because the building was at 555 California Street—to Shorenstein Properties. That price was much higher than any other bid, but real estate prices were low and soon to rise substantially, so the investment was a great success. Fife had started his career at Blyth & Company and transferred to Goldman Sachs's San Francisco office as a vice president in investment banking.

2. In the equities division, language fluency was more common than in investment banking. Partner Bill Landreth spoke French.

3. When Fife arrived, Goldman Sachs had three hundred people in London; a decade later, it had two thousand—a nearly sevenfold increase.

4. Exceptional leaders already building business in London included Bill Landreth in security sales and James MacLaren in investment banking.

5. Philip Rosen was retained to identify Goldman Sachs's public relations weakness and produced a list of twenty-five things wrong about Goldman Sachs.

6. Originally leased by Bob Wilson, who was exiled to London after presiding over the Penn

Central commercial-paper fiasco, and later used by Roy Smith and Bob Conway.

7. De la Dehesa was Secretary of State for Economy and Finance. Sheinberg knew him because he covered central banks.

8. By 1991, "country adviser" was replaced by "international adviser" to reflect the reality that many advisers were actively involved across the world in the firm's activities and sometimes only a little in their home countries. The vice-chairman title was dropped.

9. Mayoux graduated from Ecole des Hautes Etudes Commerciales (HEC) and Ecole Nationale d'Administration (ENA), was appointed Inspecteur de Finances, and served as a special adviser to the minister of Finance. For twelve years, he was CEO of Crédit Agricole, Europe's largest retail bank, chaired various reform commissions, and reorganized the steel industry as CEO of Sacilor. He then served as CEO of Société Générale, the bank where he is now honorary chairman. He is a commander of both the Légion d'Honneur and l'Ordre National de Mérite. Despite his many distinctions, Mayoux was not an immediate success when he first met senior people in New York. Bob Rubin, Steve Friedman, and Geoff Boisi did not go for him. But nobody said Fife could not hire Mayoux, so he went ahead.

10. Prodi defeated Silvio Berlusconi, who defeated Prodi in the next election and then lost to Prodi again a few years later. Berlusconi won reelection in April 2008.

11. When the telephone system of Greece announced its intention to privatize, Goldman Sachs couldn't find a way to avoid paying a bribe. So the firm opted out. The mandate was won by Morgan Stanley—but years later the deal had still not come to fruition.

12. Sutherland had also been attorney general of Ireland and commissioner of Competition for the European Community in Brussels.

13. After Telefónica, privatizations of other big Spanish concerns—Repsol and Endesa—and ADR offerings for giant private banks—Bilbao Vizcaya and Banco Santander—followed, and Goldman Sachs was regularly earning fees of $20 million every year for its work in Spain. Success in Spain helped open opportunities in Latin America, as well as across Europe. And success with Telefónica soon led to a series of telecom privatizations in Holland, Denmark, and Mexico, where Goldman Sachs was chosen to manage the massive privatization underwriting for Telefonos de Mexico (Telmex)—with a $20 million fee. The grand finale was the privatization of Deutsche Telekom with a fee close to $40 million.

14. Goldman Sachs had not developed the giant BP privatization transaction into a business relationship.

15. Plaut took over from Paul Achleitner, who led Goldman Sachs's German business for five years before he left to be finance director of Allianz, the giant insurer based in Munich.

16. Siemens was also the first major German corporation to use management consultants. In the 1980s, it retained both McKinsey and Boston Consulting Group to do studies and to have a direct comparison to see which firm did the best work—at the best fee.

17. In February 1999—right at the peak of the Internet bubble—Goldman Sachs helped Siemens spin off its semiconductor business in an €8 billion IPO. At €35 per share, demand was so strong—retail customers oversubscribed the issue an incredible 250 times—that follow-on investor bidding took the price up nearly threefold to €100. A few years later, the share price was at €8. "I should have known we were in a bubble," says Plaut sheepishly. "Capital Group took zero shares and Fidelity simply flipped it."

18. Klaus Luft also arranged an "impossible" mandate as a German working with Bob Rubin: NCR's defense against AT&T.

19. ICBC has 20,000 branches and 100 million retail customers, and is about twice as large in assets as the next largest bank in China.

Chapter Twenty-nine
Steve Quit!

1. The Bishop Estate had been a customer of bond salesmen Fred Stack, who developed a close relationship that led to discussion of a possible investment similar to Sumitomo's. Corzine met the Estate's key people at a Marriott near Dulles Airport for a preliminary discussion and then flew to Hawaii for a brief closing session.

2. Anita Raghaven and Michael Sicondolfi, "Fried-

man Steps Down as Goldman Chairman," *Wall Street Journal*, September 14, 2004, p. C1.
3. Ibid.
4. Michael Carroll, "Inside Goldman's College of Cardinals," *Institutional Investor*, October 1994.

Chapter Thirty
Collecting the Best

1. Goldman Sachs was the first to recruit Harvard MBAs in the 1920s. The Depression ended that practice.
2. Robert Levering, Milton Moskowitz, and Michael Katz, *The 100 Best Companies to Work For in America* (Reading, Mass.: Addison-Wesley, 1993).

Chapter Thirty-one
Jon Corzine

1. Corzine grew up in Wilkie Station, Illinois (population 500), and earned an MBA at the University of Chicago. He met his future wife, Joanne, in kindergarten. They grew up together and were married for thirty-three years, but divorced when he went into politics.
2. Don Gant led the 1987 negotiations and Jon Corzine led the 1989 negotiations.
3. Corzine asked partner Bob Litterman, a stellar "quant," to study risk management and develop one overall risk management system to replace the two-inch-thick daily computer printout he was then getting with reports of positions in each of dozens of separate trading units. Applying VaR (value at risk) metrics, Litterman made it possible to establish risk limits for each trade. Previously, as most traders accumulated trading profits, their self-confidence rose and their risk taking grew geometrically. Surprisingly, once VaR was established, most traders preferred knowing their limits.
4. Boris Groysberg, Sarah Mathews, Ashish Nanda, and Malcolm Salter, "The Goldman Sachs IPO," Harvard Business School Case 9-800-016, revised April 14, 2006, p. 11.
5. Laura M. Holson and Andrew Ross Sorkin, "Telecommunications Powerhouse; Goldman Sachs Rules as Industry Is Transformed in Europe," *New York Times*, December 13, 1999, p. C1.
6. A major dinner meeting with AIG that included Corzine was organized by others.
7. Corzine says he wasn't entirely alone. He recalls taking with him Chris Flowers, the banker in charge of financial institutions, who went on to a spectacular success in private equity after leaving Goldman Sachs.

Chapter Thirty-two Long-Term Capital Management

1. Sandy Weill had comparably great motivation for ordering his traders to unwind all their "perfect arbitrage" positions: The merger of Salomon Smith Barney and Travelers with Citibank was scheduled for completion that same October.
2. The main role of the Fed was to protect the group from charges of illegal collusion.
3. Corzine's recollection differs: He says the discussions with Buffett were fully disclosed to the entire group of bankers.
4. Today Corzine says the management committee knew—or at least Roy Zuckerberg knew, with the implication that he must have told all the others. This is the kind of explication that earned Corzine the nickname "Uncle Approximate" and so upset his senior partners.

Chapter Thirty-three Coup

1. It was determined at the executive committee meeting that Paulson would immediately be made co-chairman and then, at the June partners meeting, would additionally be made co–senior partner by vote of the partnership.
2. "Chief Resigns from Shared Post, at Goldman" *New York Times*, January 12, 1999, p. C1.

Chapter Thirty-four
Getting Investment Management Right

1. In Investment Banking, Suzanne Donnahoe had worked with Milton Berlinski on sales and acquisitions of investment-management firms. In the mid-1980s, David Blood went directly from Harvard Business School into the investment banking division. Soon, even before being made a vice president, he was heading the debt capital markets division with David George and Jon Corzine. Because Blood had lived in Brazil and spoke

both Spanish and Portuguese, he was assigned to cover Latin America in 1989–90 from New York City. In 1992, he joined John Thain in the bond division for four years and transferred to London.
2. Their first strategy was actually "2 × 2 × 2"—$200 billion in assets with $200 million in profits by the year 2000.
3. In 1995, investment manager Cliff Asness got a $5 million bonus—the largest paid to any nonpartner—but he knew it was just a small fraction of the profit he had made for the firm, so he quit to launch his own hedge fund and took three credit analysts with him. There was a silver lining to the storm clouds: partner Bob Litterman, the firm's risk manager for trading, transferred over to develop a global risk-management capability for GSAM called PACS. It matched portfolio construction to each client's specific investment goals, using rigorous product specifications with "risk budgets" of "tracking error" and risk measurement based on the concept that 100 percent of the risk accepted by each client should be used to achieve superior long-term performance.
4. Later Berlinski negotiated the ultimate purchase of RCM by Germany's Dresdner Bank—which also bought Kleinwort Benson, the distinguished London merchant bank with a sizable asset-management business that had participated in Kleinwort Benson McCowan.
5. Commodities Corporation was based on Helmut Wyman's theories of profits in speculative markets.
6. GSAM was managed by Ford and Blood until Ford went limited, after which Blood managed the organization for four years from London.

Chapter Thirty-five Paulson's Disciplines

1. After William Clay Ford Jr., CEO of Ford, got an allocation of 400,000 shares of Goldman Sachs in the IPO—the largest allocation to an individual—a Ford shareholder sued, alleging the allocation was a reward for Ford Motor's business with Goldman Sachs and claiming that any gain on the shares belonged to the company. While a Ford committee concluded that Mr. Ford had not acted improperly, the company agreed to settle in November 2004, and Goldman Sachs agreed to pay $13.4 million—$10 million to a Ford charitable trust (relieving Ford of a prior commitment) plus legal expenses. The firm, denying any wrongdoing, said that Mr. Ford was the kind of long-term investor it most wanted. Ford sold his shares immediately and gave the $4.5 million profit to charity. John Thornton is a Ford director and had befriended Ford at Hotchkiss School. (Jenny Anderson, "Ford Settles Investors' Suit Over IPO of Goldman," *New York Times*, November 4, 2004, C-4.)
2. *BusinessWeek*, May 17, 1999.

5. Neil Weinberg, "Fear, Greed and Technology," *Forbes* 165, no. 11 (May 15, 2000), p. 170.
6. President George H. W. Bush and his wife, Barbara, were in the residence, so Paulson got a chance to renew his acquaintance with "41."

Chapter Thirty-six Lloyd Blankfein, Risk Manager

1. While Blankfein did not use the term, his presentation is described by others as "Lloyd's 'fork in the road' speech." Blankfein's unorthodox persistence was adumbrated early in life by his strategy in dating a Wellesley College student who lived in Kansas City: He took a summer job at Hallmark to be near her. They did not marry.
2. Bethany McLean, "The Man Who Must Keep Goldman Growing," *Fortune*, March 17, 2008, p. 131.
3. Ibid.
4. David Viniar went to Bronx High School of Science and Union College, graduated from Harvard Business School in 1980, joined Goldman Sachs, and made partner in 1992. He served under John Thain and became CFO in 1999.
5. Specifically, the focus was on ABX 06-2 and a subindex of it linked to the lowest-quality credit.
6. Kate Kelley, "How Goldman Won Big on Mortgage Meltdown," *Financial Times*, December 17, 2007.
7. The creation and collapse of the subprime mortgage securities market and the harm done to many marginal borrowers and the enormous losses taken by financial institutions were malign exam-

ples of how wrongly financial markets can behave when free of well-established internal disciplines or regulation by industry umpires or governments. The impact of the collapse was enormous. The hurt to leading institutions—Citigroup, UBS, Merrill Lynch, Morgan Stanley, and many others—was large, swift, and visible. The hurt done to individual families will be largely private, personal, and invisible—but dream-destructive.

Traditionally, a mortgage lender's loan officer was trained in credit judgment and, while rewarded for making loans, was penalized for bad loans. His or her career depended on doing good conservative work to build profitable volume while not making mistakes. The mortgage lending institution acted as principal, lending its own money and keeping the loan on its own books.

All this changed with the securitization of mortgages, particularly the subprime mortgage loans most colorfully defined as "ninja" loans, made to individuals—usually young, first-time home-buyers—with *n*o *i*ncome, *n*o *j*ob, and no *a*ssets. Many of these borrowers saw house prices rising steadily, knew interest rates were low, and could borrow on interest-only (IO) terms, with no principal payments due for the first five years. Since house prices were rising faster than the rate of interest, increasing numbers of borrowers appeared to make money on the expanding differential—so, increasingly, houses got bought on speculation. Meanwhile, mortgage bankers who originate mortgages sold off their loan portfolios as securitized assets through Wall Street firms that competed for the lucrative underwriting business. Competing for volume, mortgage banks gave their officers incentives to drive for volume and made it easier to produce volume by cutting the traditionally required down payment from 20–25 percent of the purchase price to just 5 percent—or even less.

Wall Street underwriters made large profits selling securitized mortgages. They competed for market share, paying large bonuses to those who won the most volume. Credit agencies, competing with each other for the fees they got paid by the issuers, gave high ratings to mortgage-backed securities. As the underwriters eased into mortgages of lower and lower quality, nobody called out "The emperor had no clothes!" and the volume increased—increasing profits and incentives to originating lenders, profits and bonuses to underwriters, and profits and market share to rating agencies, while borrowers appeared to profit on the ever-expanding speed between the interest cost of the mortgage and the rising price of the house.

Mortgage securities, collateralized by larger, diversified portfolios of mortgages, were then "sliced and diced" into several different tranches, each with its own creditworthiness and its own credit rating. When individual mortgages in that portfolio went into default—as some were sure to do—the highest-quality tranche was fully protected because the portfolio of collateral was larger than the volume of securities sold. In addition, insurance against loss was purchased in order to obtain the best possible interest rates. Not surprisingly, a few insurance companies specialized in this type of insurance and competed with each other for more business.

The different tranches—with credit ratings ranging from AAA to BBB—offered different rates of interest and were sold to different groups of buyers. Since the lowest-quality tranche could not be sold, banks had to keep the worst "junk"—but could, according to the banks' permissive accountants, off-load them to Cayman Islands companies created for that very purpose and thus called Special Purpose Vehicles.

Meanwhile, all over the world, investment managers, banks, insurance companies, pension funds, and others reaching for higher-interest securities with high credit ratings, bought more and more securities backed by mortgages of lower and lower quality taken out by ninja borrowers.

Thirty years ago, the median down payment required of a first-time buyer was 18 percent. In 2005–2006, the median payment was only 2 percent—and half the buyers put nothing down. The tiny equity could be okay if house prices always rose, but in 2007 the average house price dropped nearly 9 percent. As a result, some fifteen million homeowners owed more on their mortgage than their houses were worth in the market.

Several factors combined to appear to justify AAA ratings, which were, in retrospect, miscalculations of several risks: relying on historical loss experience without adjusting for real changes

in the whole system of mortgage origination; taking too much comfort in geographical diversification when other factors had become more powerful and were not diversified; taking too much comfort in the history that house prices in the United States had never, on average, declined year-to-year; and an inability to model or predict borrower behavior—including fraud—in a declining market for house prices.

Then house prices, instead of rising at record rates, began to fall—for the first time since the Depression—because the ratio of house prices to rental rates had gotten way above trend; because mortgage terms could not get even easier and had already attracted marginal house buyers and speculators; because overbuilding was flooding the market (leaving numerous vacant houses with overgrown lawns and FOR SALE signs), which pulled prices downward; and because borrowers had zero or even negative equity in their houses, making it more rational to walk away than to keep paying on the now-too-large loans. While no one or two of these problems would have had serious consequences, the confluence of adversities created combinations that were cataclysmic, particularly in California.

ABOUT THE AUTHOR

Charles D. Ellis is the author of fourteen books, including *Winning the Loser's Game*, *Capital*, and the biography *Joe Wilson*. For thirty years he was managing partner of Greenwich Associates, the international strategy consulting firm he founded that serves virtually all the leading institutional financial service organizations around the world. A graduate of Yale, Ellis earned his MBA from Harvard and his PhD from New York University. He has taught the investment management courses at both Harvard and Yale, and consults on investing with international clients in America, Australia, New Zealand, Singapore, Saudi Arabia, and Vietnam. Ellis has served on the boards of Harvard Business School and Phillips Exeter Academy, and is currently chairman of the Whitehead Institute for Biomedical Research, a trustee of the Robert Wood Johnson Foundation, a director of Vanguard, and a trustee and chair of the investment committee at Yale University.

The IMF, World Bank and WTO

(Second Edition)

Richard Peet

About the author

Richard Peet is Professor of Geography at Clark University. He grew up near Liverpool and attended the London School of Economics, the University of British Columbia and the University of California, Berkeley. His main interests include development, policy regimes, globalization, power, social theory, philosophy and Marxism. He was for many years editor of *Antipode: A Radical Journal of Geography*. He also co-edited *Economic Geography* and is now editor of *Human Geography*, a new journal. He is the author of twelve books, including (with Elaine Hartwick) *Theories of Development* (2008), (with Michael Watts) *Liberation Ecologies* (2004) and *Geographies of Power* (2007).

Prefaces

Preface to the first edition

This book comes from the committed efforts of a group of faculty, graduate students and undergraduate students at Clark University, Worcester, Massachusetts. The idea was to produce a critical study of three powerful global institutions – the International Monetary Fund, the World Bank and the World Trade Organization – set in the historical context of a study of the Bretton Woods agreement, and in the ideological context of a critical survey of the principles of neoliberalism. The way we wrote the book went something like this. The process began with an initial survey of the three institutions by one of the student authors in summer 2000. In autumn 2000 and spring 2001 small groups of graduate and undergraduate students researched and wrote first drafts of the four main chapters (2–5). Between summer 2001 and autumn 2002, the senior author rewrote most of the texts contained in the drafts, composed Chapters 1 and 6, and did extensive additional research (with help from two of the graduate student authors) on all the topics covered, before delivering the manuscript to the publisher in early October 2002. The senior author is therefore responsible for the accuracy of the statements made in the book and for the opinions expressed in it.

The book covers some complex ideas; however, we have tried to write in a style understandable to people who are far from being experts in this area, but wish to know much more about globalization and global institutions. At times the going gets to be difficult as we cover a lot of complicated history, and some closely argued contentious issues, quickly but densely. The reader, of course, can work through all this in any way she or he wishes, including skipping most of the boring parts to get to the 'good bits,' usually toward the end of each chapter. But we put a huge amount of time and effort into those detailed parts, including not a few headaches, at least on the part of the senior author, and we ask that you persevere rather than throw the book down in exasperation or, worse, read it as an alternative to counting sheep. The critical conclusions that we reach are based in the histories of the institutions. Note that we do not

say based 'on' these histories, for the reading and the discussion we engaged in tended to intensify rather than form our opinions – that is, we found even more than we were indeed looking for! The main thing is, the book is best when read in its entirety.

Richard Peet would like to thank Robert Molteno of Zed Books for his informed help and his patient endurance. Richard particularly thanks Elaine Hartwick, his wife, for her deep and loving support during the eighteen months of hard work that made this book possible, and for her direct help, especially in the closing days of the book's completion, in editing parts of the manuscript and subjecting the ideas to critical scrutiny. He also thanks his children, Eric (aged two) and Anna (aged two months), and hopes that when they get to read this some time in the future they will understand why Daddy had to burrow in the basement when they wanted him to play … not always, though! We hope that this sacrifice to the Trinity is worthwhile.

LEOMINSTER, MA
OCTOBER 2002

Preface to the second edition

Things changed so much after 2002 that we had to update the book and change its emphasis in 2008. All the chapters have been significantly altered. And the concluding chapter is entirely new. The senior author did the writing and is now solely responsible for the book. Many of the ideas in the book came originally from the junior authors of the first edition: Beate Born, Mia Davis, Matthew Feinstein, Kendra Fehrer, Steve Feldman, Sahar Rahman Khan, Mazen Labban, Ciro Marcano, Kristin McArdle, Lisa Meierotto, Marion C. Schmidt, Daniel Niles, Thomas Ponniah, Guido Schwarz, Josephine Shagwert, Michael Staton, and Samuel Stratton. Their hard work and critical thinking is acknowledged with gratitude. He again thanks Elaine Hartwick, for listening, discussing, and contributing her ideas, as well as putting up with his frequent disappearances down into the depths of our basement. And we both thank our kids, Eric, now eight, and Anna, now six, for their endurance too. Eric tells me he doesn't believe in God. I advise him: don't tell anyone.

ONE
Globalism and neoliberalism

Capitalism has been international in scope since the Europeans went out to 'discover the world' some five hundred years ago. Ideas, capital, labor and resources drawn – with not a little violence – from societies ranged across the globe made possible the rise of European capitalism. And measured by mass movements across global space, such as the migration of people, or direct investment, capitalism in the early twenty-first century is only as international in scope as it already was by the late nineteenth. Yet, for some time now, a new sense of globalism has grown among people who think for a living and, what is more, whose ideas command respect. The recent intensification of long-distance interchange, many people think, has resulted in a new global era and, perhaps, a new, more worldly type of human existence.

What is this thing called 'globalization'? Definition of the term is still being contested. But there are several, similar uses, with fairly wide acceptance. The sociologist Roland Robertson (1992: 8) understands globalization to be 'the compression of the world and the intensification of consciousness of the world as a whole.' Anthony Giddens (1990: 64), another sociologist, speaks of 'the intensification of world-wide social relations which link distinct localities in such a way that local happenings are shaped by events occurring many miles away.' And the geographer David Harvey says that late-twentieth-century people 'have to learn to cope with an overwhelming sense of *compression* of our spatial and temporal worlds' (1989: 240; original emphasis).

These brief descriptions reveal two consistently related themes: global space is effectively getting smaller ('compressed') in terms, for instance, of the time taken for people, objects and images to traverse physical distance; as a result, social interactions are increasing across spaces that once confined economies and cultures. So change seems to have occurred in the scale at which even daily life is led, especially in terms of the reception of images and information, the more spatially fluid of the many elements that influence opinions, beliefs and tastes.

The human experience has globalized as the times separating spaces have collapsed. Putting this a little more realistically, an increasing proportion of people now live a geographically schizophrenic life in which the intensely local intercuts with the extensively global. Understood this way, globalization offers beautiful opportunities for disparate peoples to know and, perhaps, appreciate each other by living 'closer' together. A globalized humanity, still composed of somewhat different peoples, at last becomes possible. In this sense, globalization should be welcomed as the last act of the Enlightenment.

Behind these optimistic statements, however, lurks the possibility of something quite different. For the particular *way* in which globalization is brought about might destroy its inherently liberating potential. Giddens, for instance, goes on to refer to globalization as 'influence at a distance.' And this raises the question: whose influence? Globalization might be accompanied, even caused, by a concentration of power. So the 'communications media' that technically annihilate space saturate everyone with the same images, creating a new and more unpleasant future by homogenizing what necessarily becomes merely a virtual experience. The multinational corporations that integrate production systems into one global economy might use the opportunity simultaneously to dominate competing labor forces and to manipulate more effectively a world of consumers. Finance capital concentrated in New York, London and a few other global cities could more efficiently invest, disinvest, speculate and operate in every corner of the world. And global governance institutions, such as the World Bank or the International Monetary Fund (IMF), might bring huge swathes of entire continents under the same pernicious, undemocratic control. So rather than disparate peoples simply interacting more as space collapses, we might instead have a process in which one culture dominates the others, or one set of institutions controls all others. That is, as the space of a single global experience expands, the institutions that control economies and project cultural themes accumulate into larger entities and condense into fewer and more similar places ('world-class cities'). Or putting this again more realistically, we find a tendency toward the concentration of power accompanying globalization – and ruining its humanitarian potential.

Yet as the dialectic suggests, for every tendency toward homogenization there is a counter-tendency that reacts against it, in the direction of the reassertion, sometimes even the resurrection, of difference. And for every move in the concentration of control, there

is a counter-move that decentralizes power. So we find globalization as Westernization contested by diverse counter-tendencies, social movements ranging from sea turtle activists to al-Qaida terrorists. This contestation cannot be described simply as a clash of civilizations along regional 'fault lines' as with Samuel Huntington (1996) – the interpenetrations and interactions are far too complex to be comprehended by such a simple geographical imagination. For example, many environmental activists adhere to Eastern religious principles, while al-Qaida militants communicate via the Internet. Globalization is much more of a geographical mix. Understanding globalism, its cultures and institutions, requires careful attention to detail. Yet this need not mean waffling around in that academic style where almost saying something is regarded as declarative adventurism. There are some dependable generalizations that can be made, certainly about global governance institutions, and the hegemonic ideas these propagate, which yield insights into the present set of complex processes that make up globalization.

In this book I take the side of those critical of the way the existing global economy has emerged, and I take exception to the way in which it is currently organized, controlled and run. I am particularly critical of the objectives pursued by governance institutions, in terms of the economies that have resulted and the consequences for peoples, cultures and environments. I argue that globalization has been accompanied by the growth in power of a few prodigious institutions operating under principles that are decided upon undemocratically, and which drastically affect the lives and livelihoods of a world of peoples. I argue that the world has become more unequal and unstable as a result of financialization, private and quasi-public. But I concentrate on one particular type of institution, what is sometimes called the 'global governance institution,' as the focus of this book. In this phrase, 'governance' refers to quasi-state but unelected control and regulation of economic plans and programs, 'institution' refers to a centralized body of experts who share a common ideology, and 'global' refers to the area being governed. I concentrate on the increasing influence, within these institutions, of a single ideology that I, and many other critics, term 'neoliberalism.' So I am dealing with neoliberal globalization, not just globalization as a neutral spatial process. And neoliberal globalization is the focus of my critique, not globalization in general, and certainly not as potential.

Consequently, I argue that many of the social movements that

appear to resist globalization in general actually resist the *kind* of globalization produced by neoliberal ideas, policies and institutions in particular. I argue further that this distinction, between globalization as humanitarian potential and neoliberal globalization as dominating reality, is under-appreciated, to the point of being disastrously misunderstood. This is because the neoliberalism that now informs even conventional thinking about globalization has achieved the status of being taken for granted or, more than that, has achieved the supreme power of being widely taken as scientific and resulting in an optimal world. So resistance to neoliberal globalization is seen as resistance to globalization in general, a new kind of Luddite opposition to the technically and economically inevitable. For instance, resistance to free trade is seen as protest against trade in general, when what the protesters want instead is fair trade. When thousands of people demonstrate at each world economic summit the lament is that the protesters, 'prone to violence,' simply don't understand, are divided, misled, propose ridiculous things such as the end of capitalism, and have no idea what they want instead. Protest against the actually existing, neoliberal globalization is taken as an offense against Reason, Progress, Order and the Best World Ever Known to Man. Yet a global system that cannot know its own faults, no matter how disastrous their consequences, is the reverse of that humanitarian potential, open to a world of difference, that I envisioned earlier as globalization's promise. How did this happen?

From liberalism to Keynesianism

The central economic beliefs of Western capitalism were first set down systematically by philosophers and political economists such as Thomas Hobbes, John Locke, David Hume and Adam Smith, writing mainly in seventeenth- and eighteenth-century Britain. These founding philosophers thought hard on behalf of a new class of manufacturing entrepreneurs then coming to the fore. Essentially their philosophies rephrased more exactly modern beliefs emerging from new kinds of economic and social practice. Adam Smith's *The Wealth of Nations*, published in 1776, laid out a liberal theory of individual economic effort in a society characterized by competition, specialization and trade (Smith 1937). For Smith, capitalism left to itself had its own silent rationality ('invisible hand'), which magically transformed private interest into public virtue – with 'virtue' interpreted as an efficiently organized, growing economy capable of providing benefits for every-

one. This classical liberalism was progressive in that it questioned the authority of the landowning nobility, the grand merchants and the monarchical state, with their conservative ideas of divine rights, family values, feudal loyalties and patriotic duties. By comparison, classical liberalism was on the side of science, evidence, rationality and at least partly reasoned values (God still being needed as moral guarantor). This early liberal doctrine reacted critically against an even earlier mercantilism, in which governments intervened directly to guide the development of national economies in the interests of the accumulation of state power. By comparison, liberalism championed the rational, acquisitive but philanthropic entrepreneurial individual and the organizational efficiency of self-regulating (as opposed to state-regulated) markets. 'Natural liberty implied free competition, free movement of workers, free shifts of capital, and freedom from government intervention' (Lekachman 1959: 89).

The economic principles first elaborated by Smith were refined into a political-economic theory of liberal reform by the 'philosophical radicals,' a group active in London in the 1820s and 1830s. The most important of these was David Ricardo, a self-made millionaire from speculating in the London financial markets, and a writer of pamphlets, tracts, books and letters to the *Morning Chronicle*. Ricardo's formulation of trade theory, containing what Nobel laureate Paul Samuelson later called 'four magic numbers' representing the labor needed to produce wine and cloth in Portugal and England, became established as the classical source of the theory of comparative advantage that has guided liberal and neoliberal trade theory ever since. Ricardo (1911 [1817]: 80–81) argued that 'each country producing those commodities for which by its situation, its climate, and its other natural or artificial advantages it is adapted, and by their exchanging them for the commodities of other countries' would result in an increase in global production and the 'universal good of the whole.' He then argued that Portugal should specialize in wine production (mainly agricultural), for which it had the largest comparative advantage, and England should specialize in cloth production (mainly industrial), for which it had the least comparative disadvantage. Yet exactly this specialization had already resulted in centuries of unequal exchange to the concentrated benefit of Britain (Sideri 1970). 'Free trade' actually creates a spatial arena open to domination by economically and politically powerful countries, like Britain in the eighteenth and nineteenth centuries, and dominant

classes, like the British industrial bourgeoisie. In other words liberal theory was completely committed to class and national interests, while posing as a fine set of principles good for everyone.

Then, in the second half of the nineteenth century, these same economic ideas were further reformulated into mathematical, 'scientific' laws of market economies by neoclassical economists. Basically, neoclassical economic theory asserted that, under conditions of perfect competition, markets yield a long-run set of prices that balance, or equilibriate, the supplies and demands for each commodity. Given certain conditions – such as the preferences of consumers, productive techniques, and the mobility of productive factors – market forces of supply and demand allocate resources efficiently in the long run, in the sense of minimizing costs and maximizing consumer satisfaction. And finally, all participants in production receive incomes commensurate with their efforts. Capitalism is therefore the best of all possible economic worlds.

The market economies, however, organized by individualistic liberal principles, proved to be susceptible to system-threatening depressions. Also the vast material benefits generated by competitive productivity stuck stubbornly to the hands of the new class of entrepreneurs. As these gross deficiencies were revealed, political struggles, marked by violent and widespread protests, were enlarging the voting franchise from one restricted to property-owning men to one that included property-less working men, and women, who had previously been deemed 'sub-rational.' Then, too, soldiers returning from two great wars demanded that the freedom for which they had risked all include a greater share of the material benefits they themselves were producing. This entailed a new kind of political state that intervened to regulate the economy not merely in its own (state) interest, as with the earlier mercantilism, but for the benefit of the great majority of the peoples of the Western democracies. In other words, the bourgeois liberal state of the nineteenth century was forced by crisis, protest, wars and enfranchisement to become, by the mid-twentieth century, the liberal ('New Deal') state in the United States and the socially democratic, more interventionist, state in western Europe.

Politics in these new kinds of social economies included the right of the state to intervene directly to regulate the market economy and the new powers of democracy to redistribute wealth and equalize incomes. Post-war political economy used state intervention, exercised through various levels of planning and public ownership, in

its social democratic versions, and fiscal and monetary policy in its liberal-democratic versions, to stabilize economies and redistribute income through welfare programs, unemployment compensation, the subsidization of education and the free provision of social services. At the same time, in the colonial countries, nationalist movements for independence frequently included the socialist ideal of state direction of economies in the interests of popular social and economic development. In the Third World, dependency theory argued that accepting a production position allocated by the existing global division of labor meant accepting agricultural- and resource-based specializations that transferred income to the already rich countries at the centers of power. Most dependency theorists called, instead, for greater national economic autonomy, import substitution industrialization, and various levels of state ownership of key economic activities. All these political-economic doctrines favored state intervention in guiding what otherwise were usually staunchly capitalist economies. For this exact reason they faced strong opposition – from business interests and orthodox cultural institutions, from elements of the Republican Party in the United States, and from reactionary fractions of conservative parties elsewhere.

The economic theory informing this new kind of twentieth-century liberal capitalism came from John Maynard Keynes (1883–1946). Keynes was skeptical about many of the postulates of the neoclassical approach – for example, the notion that wage-earners were maximizers or that unemployment was voluntary. He argued that the level of employment was determined by demand for goods and services and that real investment by businesses was the crucial component of this demand. In turn, business investment resulted from decisions made by entrepreneurs under conditions of risk, with the key variable being 'expectation,' or the degree of investor confidence. The government could influence this confidence through interest rates and other monetary policies, although Keynes himself doubted that merely changing interest rates would be sufficient to alter business confidence and thus investment significantly. Subsequently, conservative Keynesian economists have seen the manipulation of interest rates as a relatively non-bureaucratic, non-intrusive method by which the central bank of a country tries to influence national income and employment. Liberal Keynesian economists, by comparison, see government deficit spending as a more effective measure: the 'liberal' part being that deficit spending can be used by the state to improve

social and welfare services. While favoring the latter course, Keynes thought that mere government *spending* was the crucial bit. When capital was scarce, saving was beneficial to an economy. But when unemployment rose, thrift impeded economic growth, and the government should spend and spend again. In general, Keynes proved theoretically what depressions had long shown in practice: that free markets do not spontaneously maximize human well-being (I discuss Keynes at greater length in Chapter 2).

In the post-war period, Keynesian economists tried to design policies that would maintain full employment in the liberal social democracies of the West. Keynes's ideas were elaborated further by the Cambridge economist Roy Harrod, who looked at how economies could be made to grow at a steady rate, and the US economist Evsey Domar, professor at Brandeis University, independently investigating the circumstances under which a growing economy could sustain full employment. The resulting Harrod–Domar model focused Keynesian theory on the relations between savings, investment and output. For Harrod the chances of a capitalist economy growing at a steady state, with full employment, were low. Instead an economy would fluctuate between periods of unemployment and periods of labor shortage. Interest rate policies and public works, put into effect by interventionist states, could decrease fluctuations and increase the possibility of steady growth. In the Domar (1947) version of the theory, emphasis was placed more on the savings rate, which financed investment and achieved a desired rate of growth. In the synthetic Harrod–Domar model, increasing economic growth basically involved increasing the savings rate, in some cases through the state budget. Development policies based on Harrod–Domar were used in left-leaning countries in the 1950s – for example, India's first Five Year Plan between 1951 and 1956. In general, post-war Keynesian economic theory established the legitimacy of state intervention in market economies with the aim of achieving growth and employment levels decided on the basis of social policy. Since Keynes, economists have divided into camps favoring the invisible hand of the market or the visible hand of state planning in guiding economic growth. And for thirty years following the end of the Second World War Keynesian intervention generally prevailed, certainly in the western European social democracies, less certainly and in a different form in the East Asian industrializing countries, but in a far more muted form in the United States. As Walter Heller, chairman of Lyndon Johnson's Council of Economic Advisors, said in

1965, in the 'age of the economist' the American political elite had to accept Keynesianism, a sentiment echoed a few years later in Richard Nixon's phrase 'we are all Keynesians now!' (Gilpin 2001: 70).

Neoliberalism

The main opposition to Keynesianism came eventually not from the external threat of communism, as most histories have it, but from internal movements for 'reform' started by neoliberals. Neoliberalism is an entire structure of beliefs founded on right-wing, but not conservative, ideas about individual freedom, political democracy, self-regulating markets and entrepreneurship. Neo*liberalism* renews the beliefs of early modern, and especially nineteenth-century, British 'classical' liberalism. *Neo*liberalism relates positively to its nineteenth-century ancestor, but critically to its twentieth-century predecessor, especially social democratic Keynesianism. So the classical liberal past is remembered in the neoliberal present not merely as received wisdom, but also through a series of creative re-enactments that respond to changed circumstances. Hence contemporary neoliberalism's obsession with the deregulation of private enterprise and the privatization of previously state-run enterprises, this time in critical reaction to Keynesian social democracy rather than liberalism's earlier reaction to mercantilism. Classical economic liberalism is recalled too within a new domain of geopolitical power relations. It openly, proudly and self-righteously displays a right-wing, ideological, political zeal, stemming from the West's 'defense of freedom' during the cold war, when liberal capitalism battled totalitarian communism. Likewise, it basks in the aura of a market triumphalism stemming from the collapse of the Soviet Union in what Francis Fukuyama (1989) mistakenly called 'the end of history' – that is, the apparent ending of all political alternatives to liberal democracy (he forgot about Islam and its many political offshoots). And when this aura was rudely disturbed by the events of 11 September 2001, neoliberalism revealed what had been there all along – American militaristic domination based on an ability to kill in quantity, anywhere in the world, within twenty-four hours of a presidential declaration of emergency.

Classical liberalism was remade into a more exact neoliberal ideology at a number of coordinated centers of influence and persuasion: the Austrian School of Economics in Vienna in the early twentieth century, the London School of Economics in the 1930s, the Institute of Economic Affairs, the Centre for Policy Studies and the Adam Smith

Institute, all in London, the ordo-economics school of Walter Euchan and Franz Bohm at Freiburg and the Hoover Institution at Stanford University in California, to mention but a few. The intellectual capital of neoliberalism, however, is undoubtedly the Chicago School of Political Economy. This influential school of thought was started by Frank H. Knight, a liberal in the nineteenth-century sense, a critic of New Deal (twentieth-century) liberalism and a believer in the ideal of the creative, active, free individual. Knight was followed by a second generation of liberal revivalists, including Milton Friedman, George Stigler, James Buchanon, Gary Becker and Robert Lucas, who likewise favored self-interested, competitive behavior in economy, polity and just about everything else – Becker, for example, thinks that knowledge of markets illuminates questions of race, education and the family. The rightist politics of the Chicago School were translated by Friedman into the apparently scientific, neutral mathematical codes of monetarist economics (that is, the idea that macroeconomic problems such as inflation and indebtedness derive from excessive government spending driving up the quantity of money circulating in a society). These ideas were spread in popular versions carried by sympathetic mass media, an industry that also abhors state regulation. So Friedman's articles were regularly carried by *Newsweek*, while Friedrich von Hayek's *The Road to Serfdom* (1956) was carried in shortened form by *Reader's Digest*. Neoliberalism vitally affected the return of economics to its classical and neoclassical past. Thus the Smith of the neoliberal revival is a proponent of individual selfishness – 'give me that which I want, and you shall have this which you want' (Smith 1937: 14) – rather than Smith the modern moralist (Smith 1976), who thought that selfishness should be both self-regulated and externally limited. (Indeed, Smith himself preferred 'self-interest,' as with personal striving mitigated by virtue, as the prime motivator of economic behavior. Rather than pure selfishness, he said, justice should be the basis of society – Fitzgibbons 1995.) And the later, nineteenth-century economics remembered by the neoliberal revival is all marginalist calculation and mathematical equilibrium, rather than the ethical economics of John Stuart Mill or Alfred Marshall.

All neoliberal revivalists, however, even the almighty Friedman, pale in comparison with neoliberalism's guru, the early critic of Keynes and 'socio-philosopher of economics,' Friedrich von Hayek. Von Hayek trained at the Austrian School of Economics, where he was a protégé of Ludwig von Mises, a major critic of central planning,

who argued that, without markets, means of production could not be optimally combined. Von Hayek became a professor at the London School of Economics (1931–50), the University of Chicago (1950–61), and Freiburg University in West Germany (until his death in 1992). Von Hayek was also mentor to the Mont Pelerin Society, begun in 1947 at a hotel in Switzerland, attended annually by the leading lights of neoliberalism and dedicated to the 'exchange of ideas about the nature of a free society and … the ways and means of strengthening its intellectual support' (Leube 1984: xxiii). Essentially von Hayek's philosophy rested on two positions.

First, the growth of civilization comes from the freedom of its individual members to pursue their own ends in the context of private property rights. Social institutions, primarily the market, work best when derived from the voluntary and spontaneous collaboration of free men. Market competition generates an economic order (*cosmos*) that is the product 'of human action but not human design.'

Second, governments should therefore be democratic, with fixed limits on the sphere of their command, especially their powers of coercion. Planned economic orders (*taxis*) can handle only limited complexity. In particular, collectivist economic planning (even of the social democratic kind) leads inevitably to totalitarian tyranny (von Hayek 1984, 1988).

Von Hayek combined an ability to make broad, philosophical pronouncements like these, which seemed to derive from a deep knowledge of human history, with a more practical economic competence sufficient to oppose Keynes in terms that gained respect among professional, neoclassical economists – in the 1930s 'the new theories of Hayek were the principal rival of the new theories of Keynes' (Hicks 1967: 203). Or, putting it differently, von Hayek was one of a few 'dismal scientists' who could almost philosophize and get away with it. The efforts of von Hayek, Friedman and the Mont Pelerin Society to revive nineteenth-century liberal, classical and neoclassical principles, particularly in the discipline of economics, were reinforced by anarcho-capitalist notions developed in political science (that is, the idea that the free market can coordinate all functions of a society currently carried out by the state) and published in works written mainly by Austrian- or Chicago-connected political theorists, especially Murray Rothbard and David Friedman. The ensemble of economic and political ideas that made up neoliberalism moved rapidly from right-wing quackery to recognized convention in 1974 when von Hayek was awarded the Nobel Prize at a

time of widely supposed crisis in post-war Keynesianism (specifically, problems such as stagflation, which could not readily be solved using Keynesian fiscal and monetary policy).

In a landmark study that brings the work of Karl Polanyi up to date, Mark Blyth (2002) argues that what we, in this study, call neoliberalism was actually made up of four intersecting ideas: at base, a monetarist analysis of inflation developed by Friedman, which culminated in the position that markets were self-equilibriating in the long run and that intervention by the state was deleterious, if not perverse; the theory of rational expectations, which says that rational optimizing economic agents discount interventionist strategies pursued by governments, making state intervention 'at best a waste of time and money … [and] more likely downright dangerous … [indeed] governments *cause* recessions and depressions by their very actions' (ibid.: 144); supply-side economic theory, a resuscitaton of Say's law (supply creates its own demand) in the extreme form, proposed by Arthur Laffer, that tax cuts, especially for the rich, were self-financing (through an increase in production and, consequently, tax revenues); and public choice theory, in which politicians are analogs of market actors, maximizing votes by providing goods to constituents and therefore making democratic governments prone to generating inflation. The four theories combined in concluding that inflation, due to intervention by the state in an otherwise naturally self-equilibriating economy, was an all-encompassing social crisis treatable not by Keynesian policies (for these were the cause) but by neoliberal, market-oriented means.

American big business moved from reluctantly accepting Keynesian state regulation of the economy during much of the post-war period to actively supporting neoliberal deregulation in the mid-1970s: large US corporations and banks that had previously supported (twentieth-century) liberal research foundations, such as the Brookings Institution, switched allegiance and financial backing to right-wing think tanks, such as the Heritage Foundation, which became increasingly wealthy and influential (Kotz 2000). Blyth (2002: ch. 6) argues specifically that governmental policies put into place in the radical late 1960s and early 1970s persuaded American corporations that they must reinvigorate collective business institutions such as the National Association of Manufacturers, the American Chamber of Commerce (which quadrupled its membership during the 1970s) and the Business Roundtable, whose members controlled half the GNP of

the USA. Concluding that institutions responsible for the production of ideas, especially the media and universities, had become dominated by their critics, business not only re-established control of the political process, especially by financing political action committees, but went farther to produce ideas in support of free enterprise. The main means of doing so were the think tanks, such as the Heritage Foundation (bankrolled by the conservative Olin Foundation, headed by William Simon, secretary of the Treasury in the Nixon administration), the Hoover Institute and the American Enterprise Institute. Perhaps the single most important intellectual influence pushing policy to the right came from Martin S. Feldstein, a rightist economist who has long taught 'Ec10,' a 'decidedly anti-tax, free market-leaning introduction to economics' to thousands of students at Harvard University, many of whom have gone on to prestigious positions in the US Treasury Department (Leonhardt 2002), and who, as president of the National Bureau of Economic Research, provided a more serious rationale than Laffer for cutting taxes. The conservative business foundations, especially Scaife and Olin, also financed the diffusion of neoliberal ideas to the public through financing television documentaries and neoconservative journals, such as *Public Interest*, and by supporting right-thinking social scientists, writers and journalists. The *Wall Street Journal* acted as synthesizer and proselytizer for this disparate collection of ideas. In terms of global attitudes, US corporations, particularly those operating in emerging areas such as information technology, realized that they could compete in a neoliberal global space of free commodity movements and open capital markets liberated from 'miles of red tape.' Neoliberal economic policies were eagerly adopted by 'supply-siders' in the Reagan and Thatcher governments in the early 1980s. Following Milton Friedman's (1958) lead that 'millions of able, active and vigorous people exist in every underdeveloped country' and 'require only a favorable environment to transform the face of their countries,' neoliberal policies – aimed at creating 'more competitive markets with brave, more innovative entrepreneurs' – took over a previously liberal, interventionist development economics in the 'counter-revolution' of the 1970s and early 1980s (Straussman 1993; Toye 1987). By the mid-1980s, neoliberal economics had come to dominate a previously social democratic and Keynesian development discourse.

This domination extended to the global governance institutions. While the IMF and the World Bank have long used neoclassical

economics as the theoretical basis for policy formation, starting in the mid-1970s for the IMF and the late 1970s for the World Bank, the controlling faction of economic belief shifted to the right under the combined impetus of two growing tendencies. The first was a change in the discipline of economics away from Keynesianism and toward a neoclassicism influenced by the Austrian School's trust in markets, as opposed to state regulation, and by the monetarist theories of Milton Friedman, which likewise minimized state intervention in the economy. The second was a rightward shift in political opinion at the end of the 'long decade of the sixties' (that is, stretching well into the 1970s) marked by the elections of Margaret Thatcher and Ronald Reagan – Thatcher, for example, read von Hayek as an Oxford undergraduate and proclaimed that Hayekian ideas were what a right-wing Conservative Party should believe in (Yergin and Stanislaw 1999: 107) – and by the appointment to high posts in the US Treasury Department of dedicated right-wing ideologues who forced Hayekian principles on the Fund and the Bank on threat of withdrawal of US funding. As Reagan said to the annual meeting of the World Bank in 1983:

> The societies that achieved the most spectacular, broad-based economic progress in the shortest period of time have not been the biggest in size, nor the richest in resources and certainly not the most rigidly controlled. What has united them all was their belief in the magic of the marketplace. Millions of individuals making their own decisions in the marketplace will always allocate resources better than any centralized government planning process. (IBRD 1983: 2)

This is a statement drawing intellectual power directly from von Hayek, the Austrian School and Friedman. And this was a statement warning the Bank to move decisively against state-led development, or else! Under the control of neoliberal beliefs ever since, the global institutions governing the development of the world economy have consistently advocated a set of economic policies virtually identical to those of national governments.

The Washington Consensus

One account widely referred to in describing these policies has been advanced by John Williamson, senior fellow at the (Washington, DC) Institute for International Economics. Some time ago, Williamson (1990, 1997) coined the term 'Washington Consensus' to refer to

the set of policy reforms imposed when debtor countries in Latin America were called on to 'set their houses in order' and 'submit to strong conditionality.' By 'Washington' Williamson meant the political Washington of the US Congress and senior members of the administration, and the technocratic Washington of the international financial institutions, the economic agencies of the US government, the Federal Reserve Board and the think tanks, such as the one at which he himself works. And by 'policy' he meant policy instruments rather than more general objectives or eventual outcomes. The set of 'policy instruments' derived from the Washington Consensus and applied to borrowing countries by the World Bank and the IMF were said by Williamson to include:

Fiscal discipline. Large and sustained fiscal deficits are a main source of macroeconomic dislocation in the forms of inflation, balance of payments deficits and capital flight. These deficits result from lack of political courage in matching public expenditures to the resources available. An operational budget deficit in excess of 1–2 percent of GNP is evidence of policy failure.

Reducing public expenditures. When expenditures have to be reduced the view is that spending on defense, public administration and subsidies, particularly for state enterprises, should be cut, rather than primary education, primary healthcare and public infrastructure investment.

Tax reform. The tax base should be broad, tax administration improved, and marginal tax rates cut to improve incentives.

Interest rates. Financial deregulation should make these market-determined rather than state-determined, and real interest rates should be positive to discourage capital flight and increase savings.

Competitive exchange rates. Exchange rates should be sufficiently competitive to nurture rapid growth in non-traditional exports but should not be inflationary – the conviction behind this is that economies should be outward-oriented.

Trade liberalization. Quantitative restrictions on imports should be eliminated, followed by tariff reductions, until levels of 10–20 percent are reached – the free trade ideal, however, can be temporarily contradicted by the need for protecting infant industries.

Encouraging foreign direct investment. Investment brings needed capital, skills and know-how and can be encouraged through debt–equity swaps – exchanging debt held by foreign creditors for equity in local firms, such as privatized state enterprises.

A competitive economy. All enterprises should be subject to the discipline of competition – this means privatizing state enterprises in the belief that private industry is more efficient, and deregulating economic activity in the sense of reducing state controls over private enterprise.

Securing property rights. Making secure and well-defined property rights available to all at reasonable cost.

In brief, said Williamson (1990: 18), the economic position Washington concurred on in setting policy for the rest of the world (but did not necessarily follow itself) could be summarized as 'prudent macroeconomic policies, outward orientation, and free market capitalism.' This list of policies making up the Washington Consensus, he said, stemmed from classical mainstream economic theory, if Keynes can by now be counted as 'classical.' Essentially, by 'mainstream theory' Williamson meant neoclassical economics.

In a bit more detail, these policies favor an outward-oriented, export economy, organized through markets, with minimal state regulation, along with privatization, trade liberalization and limited (state) budget deficits. Economic policies stemming from the neoliberal perspective are promoted by global institutions regardless of national circumstance, such as cultural tradition or social structure, and regardless of previous tradition in the political economy of development. For their adherents, neoliberal policies produce a rapidly growing, market-oriented, profit-driven economy that generates sufficient jobs and taxes to rectify any social or environmental problems that might occur along the way. For their opponents, neoliberal policies ruin whatever ability Keynesian state intervention once had to produce capitalist economies complemented by social justice. Indeed, critics think that global capitalism is now in the midst of a series of interlinked financial, resource and environmental crises originating exactly in unregulated, pro-financier, neoliberal economic growth. We now have two polar opposite views on neoliberalism: what became the conventional wisdom, that neoliberal policy is the best economic science has to offer; and what has become the unconventional, dissident belief, that neoliberalism is a recipe for global economic, social and environmental disaster.

The institutional framework

In terms of the institutional formation of recent neoliberal economic policy the term Washington Consensus can be used to refer to an agreement among some of the main interest groups: the poli-

tical interests that brought right-wing 'progressive-reform' ideals to Washington in the mid-1970s and early 1980s, for instance; or the bureaucratic-technical interests whose professional training in neoclassical economics proved readily amenable to Hayekian and Friedmanesque persuasion. But interestingly Williamson downplays the academic component of policy formation, as with what I have called the Cambridge (Harvard–MIT) connection, and forgets almost entirely the economic interests, well represented in Washington, but headquartered elsewhere. The World Bank and the IMF operate primarily as bankers to the central banks of nation-states. Banks have power over policy formation because they control access to capital accumulations. And capital accumulations are institutionally controlled by commercial and investment banks. These banks are headquartered outside Washington in commercial cities such as New York, Boston, London, Zurich and Tokyo. Any conception of the formation of economic policy by global governance institutions has to take this broader connection with the banking world into account. Jagdish Bhagwati has called this connection the 'Wall Street–Treasury Complex' (in Wade and Veneroso 1998: 18), while Joseph Stiglitz (2002a: 230), no stranger to Washington policy circles, says that the IMF in his experience follows 'an ideology that was broadly consonant with the interests of the financial community.' Let us expand on these brief allusions by following some connections to the Wall Street financial community.

When we look at the actors crucial in setting up the neoliberal economic policies used for more than twenty years by the World Bank and the IMF, and when we glimpse beneath the surface of WTO policy-making (courtesy especially of leaked documents), we find evidence of a far broader circle of consent than that formed in Washington, DC. As our discussion has shown, neoliberal policy became evident in the mid-1970s when Washington was controlled by the Nixon and Ford Republican administrations, and was solidified (in the sense of being codified into the Washington Consensus) in the 1980s, under the Reagan and (first) Bush Republican administrations. Some of the key players making policy at the time were:

- William E. Simon, deputy secretary and later secretary of the Treasury in the Nixon and Ford administrations, US governor of the IMF and the World Bank, the Inter-American Development Bank and the Asian Development Bank. Simon had previously been

a partner at Salomon Brothers, a prominent Wall Street investment banking firm, and was active in the Investment Bankers Association of America.

- James A. Baker III, secretary of the Treasury in the Reagan administration between 1985 and 1988, previously with the Houston, Texas, law firm of Andrews and Kurth from 1957 to 1975 and, after public service, senior partner in the law firm of Baker and Botts and senior counselor to the Carlyle Group, a private global investment firm.
- Richard Darman, assistant secretary of commerce for policy in the Ford administration and deputy secretary of the Treasury (1985–87) in the Reagan administration. Darmon was a graduate of the Harvard Business School and had been a partner and managing director of the Carlyle Group and managing director of Shearson Lehman Brothers, a Wall Street investment banking firm. After public service he returned to the Harvard University Kennedy School of Government in 1998, where he had previously been a lecturer from 1977 to 1980.
- Nicholas F. Brady, appointed secretary of the Treasury by President Reagan in 1988, and continuing in office throughout the Bush administration, was former chairman of the New York investment banking firm Dillon, Read and Co.
- David Mulford, under-secretary for international affairs, and senior international economic policy official at the US Treasury under Secretaries Regan, Baker and Brady, was a lead actor in Republican administrations' international debt strategy and was formative in the development and implementation of the Baker and Brady Plans. He had been managing director and head of international finance at White, Weld & Co., an investment banking firm. After public service he became vice-chairman of Credit Suisse First Boston and a member of the executive board.

This pattern continued in the Clinton Democratic administration of 1992–2000, with the main players being:

- Robert E. Rubin, secretary of the Treasury for much of the Clinton administration and previously co-senior partner and co-chairman of Goldman Sachs and Company, a Wall Street investment banking firm. After public service Rubin became a director at Citigroup Inc., a New York commercial bank, and a member of the Citigroup Management Committee. Citigroup owns Citibank,

a commercial New York bank, and Salomon Smith Barney, an investment services company, together with insurance companies and many other financial service corporations.

- Lawrence H. Summers, who followed Rubin as secretary of the Treasury, had been president of development economics and chief economist of the World Bank. Previously he was professor of political economy at Harvard, to which he returned as controversial university president in 2001.

In terms of the backgrounds and private sector affiliations of the key players, in terms of the knowledge and expertise that they brought to bear and, more controversially, in terms of the interests they served, the 'Washington Consensus' might more accurately be described as the Washington–Wall Street Alliance, an institutional complex centered on the US Treasury Department, the IMF and the World Bank, with an intellectual offshoot to Harvard University and MIT, particularly the Harvard Business School, whose MBA, doctoral and executive education programs train the corporate and banking elites, but with the leading role being played by Wall Street bankers, especially investment bankers.

Investment banking is a specialized part of the US banking industry, created by the Bank Act of 1933, more commonly known as the Glass–Steagall Act. The Act was supposed to separate the banking and securities businesses and led to a division between commercial banking, taking deposits and issuing short-term loans, and investment banking, concerned with corporate finance (advice on raising capital by issuing stocks and bonds and marketing them on Wall Street), corporate mergers and acquisitions, arbitrage (buying and selling in world commodity and currency markets), underwriting and dealing in corporate and other securities – the most important part for our purposes is that the investment bankers deal in long-term loans. The largest investment banking concerns were: Salomon Smith Barney; Merrill Lynch, Goldman, Sachs; Morgan Stanley-Dean Witter; and Shearson Lehman Brothers. Since the repeal of Glass–Steagall in 1999, commercial banks, such as Chase Manhattan Corporation and Citibank, have developed, or acquired, investment banking facilities, as well as a range of insurance and stock brokerage services, to produce the largest financial conglomerates in the world – indeed, the most powerful corporate institutions in the world in terms of capital controlled. In the crisis of 2008 the investment banks folded, were absorbed

into commercial banks, or became commercial banks. Banking is an 'economic interest' combining two particular concerns: the banking interest directly, in terms of the practical necessity of conserving control over capital stocks placed with bankers to earn interest; and the corporate interest more generally as bankers advise and represent their corporate clients in return for fees of up to $100 million a year, with the banker-brokers rewarding corporate CEOs with IPOs (Initial Public Offerings of stocks) that are worth millions.

Adding the Wall Street connection, meaning the banking and securities businesses, to the Washington Consensus, meaning the political and bureaucratic apparatuses, enables a more revealing analysis of the power of policy practicality. For example, it enables us to understand why well-meaning presidents of the World Bank, like James Wolfensohn, persisted in practicing pernicious policies. Private financial interests, especially investment banking, acting most forcefully through the US Treasury Department, as well as through direct consultation, and deriving ideas and talent from the elite universities, have greatly influenced, even determined, the formation of policy in the IMF–World Bank–WTO governance complex. (For example, at the September 2002 meetings of the IMF and World Bank 'international bankers, investment executives and other financial specialists attended a gathering a few blocks away from the official meetings' at the Institute of International Finance, an encounter described by Klaus Friedrich, an advisor to Allianz-Gruppe/Dresdner Bank of Germany, as 'a lot of bankers with problems in their briefcases' – Blustein 2002c.) These financial interests prevent serious consideration of alternative policy directions through their control over expertise and their underlying command of capital. If we re-read the 'Washington Consensus' policies from the bankers' perspective, we can see that minimizing state spending, increasing competitiveness, securing property rights (including those of foreign companies), export-orienting economies to produce hard currency, all maximize the loan capacity of 'developing countries' and ensure, to the fullest extent possible, the ability of an economy to repay principal and interest. I am not, on the whole, suggesting some kind of cynical conspiracy by bankers and multinationals to create puppet economic regimes, despite the evidence that meetings recur among banking and governmental allies. And I recognize that once appointed to bureaucratic positions, bankers have considerable freedom to interpret what remains, however, the banking point of view. But an export-oriented, privately controlled, market economy *is* the

banker's conception of the good economy, even when considered in terms of the more general common good.

The problem is that this notion of a 'sound economy' does not sound too commonly good to those about to be made unemployed, cut off from public services, and paying exorbitant prices for water, electricity and other privatized services. And the notion that a 'sound economy' formed in this way will be good for everyone in the future is a matter of faith that shows every sign of rebounding, as financial capitalism comes into mounting crisis in 2007 and 2008. The Washington–Wall Street alliance has established, protected and reinforced a neoliberal policy regime that served to deregulate the world economy (in terms of national state intervention), freeing the way for global, and particularly US, corporations, the trading of industrial commodities without interference, and the movement of capital assets across national boundaries that have been reduced in significance. Rather than a 'sound' global system, the result is a wild economy of colliding interests, speculation and losses beyond the control of any particular interest or institution (see Chapter 6).

Here I must raise the most difficult question of all – what about 'The Market'? Saying that Wall Street is the most powerful actor in setting the policy model used by global governance to discipline countries the world over implies a more conscious collective actor than is actually the case. The central 'institutions' of Wall Street are the equity and bond markets, and these no one controls. While financial analysts may objectively 'study the numbers' in evaluating whether to invest client capital in bonds issued by a country or the corporations of a country, the decision is rendered into a subjective judgment by Keynes's uncertainty about the future, when the bonds will be repaid. George Soros, who knows more than most as head of the Quantum Fund, 'the best performing investment fund in history,' says of financial markets:

> Each market participant is faced with the task of putting a present value on a future course of events, but that course is contingent on the present values that all market participants taken together attribute to it. That is why market participants are obliged to rely on an element of judgment. The important feature of bias is that it is not purely passive: It affects the course of events that it is supposed to reflect. This active ingredient is missing from the concept of equilibrium employed by economic theory. (Soros 1998: 47)

The international financial market, then, is a meeting point where biases collide and where speculative subjectivities interact. The collision of uncertainties on the market determines the economic fate of nation-states and the global economy. As John Gray says: 'National governments find themselves in environments not merely of risk but of radical uncertainty … governments often cannot know whether the response of world markets to their policies will be merely to make them costly or to render them completely unworkable' (Gray 1998: 74–5). This is the model that the IMF wants to expand by further freeing capital markets from national controls? This is the best that 'economic science' has been able to imagine for determining the livelihoods of billions of people? This is the organizational matrix of the finest civilization ever known? No. This is the system that has plunged the global economy into financial crisis.

Hegemony and policy discourse

Professional economists subscribe with surprising frequency, in these days of social theoretic sophistication, to the view that policy prescriptions derive from a logically exact, mathematical economic science backed by quantifiable, truthful, empirical evidence. Even reworked as neoliberalism, neoclassicism is better than Keynesianism, because it has been proved to be the case. Yet there are many Keynesians with fine academic credentials, whose ideas are taken seriously even in conventional policy circles – Paul Krugman, columnist for the *New York Times*, for instance, or the Nobel Prize-winning Joseph Stiglitz, formerly chief economist at the World Bank. And the historical evidence, examined carefully, suggests that state intervention produces both economic growth and social development – see, for example, Robert Wade's (1990) 'governed market' theory of East Asian industrialization. Once the notion that policy derives from scientific truth has been treated with a healthy dose of skepticism, the need arises for a different approach to the analysis of economic policy formation, one emphasizing context, power and political interest. In this contrary view, economic theories are seen as symbolizing political interests and ideals, rather than deriving from the neutral findings of an exact social science. Even more, economic policies are seen as cultural and political statements that claim power by cross-dressing in the legitimizing garb of science. In brief, economic policy analysis is a cultural, political and social endeavor, rather than a study of the application of proven, scientific truth.

When big corporations pay millions of dollars to political parties in return for the promise of access to the president, they do so in the expectation that their donations will influence future governmental policy. Money buys influence, especially on policy. In this sense, any critical understanding of policy formation has to begin with the basic notion that policy serves economic and social interests. Here the most useful connection between interest and policy is the Marxian term 'ideology.' For Marxists, a dominant social power, conceptualized as a class, naturalizes and universalizes beliefs and values that are congenial to its interests. That is, statements are made by power interests in order to have politically legitimizing effects in the face of opposing interests (Eagleton 1991: ch. 1). But while the notion of interests begins an analysis, this crucial insight is insufficient. It has to be amended, by Antonio Gramsci's notions of civil society and hegemony. With Gramsci 'civil society' is a system of social and cultural institutions (family, Church, schools, and so on) outside, and parallel to, the state in a broad conception of 'civil and political superstructure.' Gramsci believed that ideological hegemony was established mainly by civil rather than state institutions. In this formulation, hegemony is a conception of reality, spread by civic institutions, that informs values, customs and spiritual ideals, inducing, in all strata of society, 'spontaneous' consent to the status quo. Hegemony is a world view, so thoroughly diffused that it becomes, when internalized, 'common sense.' Gramsci seems to include in this 'sense' the formation of economic behavior in civil society: 'Every social form has its homo economicus' (Gramsci 1971: 208). So Gramsci (ibid.: 412–13) saw economic rationality responding to material necessity by constituting a complex of convictions and beliefs, from which concrete goals were proposed to collective consciousness. This brief review of Gramsci moves the analysis from the ideological level – the socio-political production of *what* people think – to the hegemonic level – the sociocultural production of the *way* people think.

With my present concern about policy, however, I am interested in a particularly formalized system of producing good economic sense. This is an area of cultural-political production inhabited by highly trained, experienced individuals – 'experts' – and well-established, abundantly financed institutions – government departments, think tanks, banking associations, and the like. The entire social process of high-level institutionalized thinking, and the cultural process of producing insightful (but limited) ideas, employs a certain kind of

symbolic representation for which even the Gramscian term 'common' sense is insufficient. While thinking may begin at the common-sense level, and return to it when policies are explained by 'spokespersons' to the 'general public,' the intermediate stage of theorization and policy formation takes place at a different, theoretical order of symbolization – theories being experientially based, but highly rationalized, dense statements. On to a Marxian–Gramscian base we might therefore graft Michel Foucault's notion of 'discourse.' Foucault (1972, 1973) was particularly interested in the careful, rationalized, organized statements made by experts – what he called 'discourses.' In *The Archaeology of Knowledge* (1972) Foucault saw the human sciences as autonomous, rule-governed systems of discourse. Within these discourses, Foucault claimed to discover a previously unnoticed type of linguistic function, the 'serious speech act,' or statements with validation procedures made within communities of experts (Dreyfus and Rabinow 1983: 45–7). At the other end of the scale serious speech acts exhibited regularities in what Foucault called 'discursive formations.' Discursive formations had internal systems of rules determining what was said, about which things. Discourses had systematic structures that could be analyzed archaeologically (identifying their main elements and the relations that formed statements into wholes) and genealogically (how discourses were formed by institutions of power). We take from this the notion that discourses are carefully rationalized, organized systems of statements, backed by recognized validation procedures, bound into formations by communities of experts. Discourses assume, as one, particularly significant propositional form, the shape of economic policies suggested by experts to governing bodies. In other words, hegemony in the policy arena is theoretically backed, political and economic good sense produced by experts in the symbolic form of discourses.

Thinking in this Gramscian–Foucauldian way, economic policy does not come from science's ability to mirror social reality in a structure of truthful statements called exact theories. Instead, policy is socially produced by a community of experts who agree, more by convention or political persuasion than factual backing, to call a certain type of thinking and speaking 'rational.' Briefly returning to Foucault (1980), calling a certain proposal to organize an economy 'rational,' 'efficient,' 'optimal' or even 'sound' is a way of claiming power, and such terms place the reputation of science behind what is really just one, class-biased, opinionated way of thinking.

Furthermore, once a claim to rationality (or optimality, etc.) has been widely accepted, once a group of experts is deemed to speak the truth, further discussion is limited to a narrow range of economic topics (e.g. growth), thought with a prescribed set of theories (e.g. neoclassical economics), using a prescribed set of terms (e.g. equilibrium). Within this narrow thought system, formal analysis uses an intellectual code that specifies approved categories and terms. Simply using these terms restricts what can be thought, said and imagined. That is, the depth of hegemony resides in the ability of a discursive formation to specify the parameters of the practical, the realistic and the sensible among a group of theoreticians, political practitioners and policy-makers. A discourse operates negatively by producing and enforcing silences on disapproved topics, terms and approaches. I propose that positive reinforcement and negative compulsions of silence are concentrated in 'restrictive discursive spaces' – places where insider status is paramount, where only one discourse is effectively permitted, where critical discussion is limited to variants of a given discourse, where other positions are disciplined as irresponsible, and where using a different discursive terminology means that real critics are simply not heard. I regard these as places characterized by an arrogance of expert power.

The crucial part of this limitation on thought and expression is the institutional production of what might be called a 'practicality,' by which I mean a social sense of the content and boundaries of the pragmatic. That is, in the present case, the appropriate policy response to a given economic situation comes from a limited set of theories and range of alternatives that is socially, institutionally designated as 'practical.' This practical position, established by consensus among experts – who agree in general, while often disagreeing on particulars – draws on its extremes, inevitability and optimality, depending on the severity of the crisis that is faced. So a sense of 'inevitability' backs policy in the most politically contested situations – 'there is no alternative' or 'TINA' – while optimality backs practicality in less compelling circumstances – 'this is the best of all possible worlds.' A social sense of practicality precludes serious consideration of (theoretical and policy) alternatives by producing an ambiance of sober responsibility. 'Responsible spokespersons' operate only within its strictures using code words that, designating insider status, make other positions unrespectable – think of Henry Kissinger invoking 'the national interest' and you will get what I mean. In all

this, the trick lies in converting a politics, which represents a distinct class interest, and consists essentially of a set of opinions, into a practicality that appears to come from theory, and seems to express the common, rather than the partial, good. Phrasing this differently, if a little densely, the politics of hegemonic policy-making takes the form of the conquest of the common sense of practicality by a committed expertise.

There are, of course, competing tendencies within a hegemonic expertise, each responding to a somewhat different interest, with its own politics of interpretation, based on a variant of the dominant political belief. In terms of the formation of economic policy by the state, three groups of experts holding somewhat different versions of an overall prevailing view seem to be important:

1 conventional, talented theorists in the elite universities, especially those attended by future elites – the *ideological interest*;
2 key players outside the state apparatuses, but linked through exchanges of personnel, through frequent consultations, and other discursive mechanisms – in the main, the *economic interest*;
3 elected heads of state (president or prime minister) and the appointees controlling key state agencies, as with the Treasury or State Departments in the USA, together with the civil servants staffing government agencies, especially the upper echelons where policy is debated – I call this the *political interest*.

Competing tendencies among these interests create instabilities within the most established policy hegemony. Yet, at any time, a small number of leading political ideals expressed by key personalities establish the new styles that keep a policy discourse fresh. They employ persuasive new vocabularies, using innovative terms, even an archetypal aesthetic in the design and expression of the ideas they present, which come to permeate an entire hegemonic complex, with no small part of the motivational drive coming from interpersonal competition for reputation, power, status and consultancy fees. At the same time a power complex has its concentrated weak spot, often its institution of conscience, that serves to legitimize a hegemony by displaying sympathy, but can turn toward real conscience in times of crisis in a discursive formation.

Discourses with hegemonic depth originate in a few power centers where only a limited set of ideas are allowed 'responsible' presentation and elaboration. In analyzing these spaces, the clusters of economic

and political institutions that carry out the production and legitimization of theories, and the dissemination of policy prescriptions, are the crucial agents. Policy discourses are invested with power by the wealth and might of the geographical place of their intellectual origin and their most conspicuous application. In Western modernity the dominant centers of discourse production are embedded in the cultural region of the formation of scientific rationality (Peet 2000, 2007). Following a Weberian conception of the space of rationality, the centers of modern power are dominantly located in Protestant western Europe and North America, symbolized by the two Cambridges, in England and New England, home to the finest institutions of knowledge production in the anglicized world. The organized, systematized ideas behind an economic discourse often originate in theories or ideas 'floated' in the public arena by academics in the elite institutions embedded in this culture region – usually the elite universities, with large endowments stemming from long-established capital accumulations, collections of the world's finest intellects, whose very density lends 'truth effects' even to casual statements. Professionals from the academic world, especially the leading universities, and particularly the leading law departments, business schools, economics departments and the well-funded research institutes, carry policy discourses directly into the state when they are appointed to head government departments. The choice by an incoming administration of an academic to become part of the state – for example, serving a term as deputy secretary in the US Treasury Department – is partly determined by academic status and reputation. But the decision tends to be more directly motivated by political adherence tempered by ability – that is, the academic's ability to translate a political position into the technical terms of a policy document. Elite academia also trains the personnel staffing the upper reaches of political and economic bureaucracies. Thus academia serves as source of theory, domain of policy formation, provider of committed expertise and trainer of personnel.

The ideas behind a policy discourse also emerge more directly, however, and perhaps more forcefully, from economic activity as interpreted especially by business and financial elites. Here the discourse is more practical than theoretical, while power rests not so much on intellectual foundations as on control over wealth, capital accumulation, and technical expertise flowing from crucial positions in the economy – banking, for instance. Depending on the degree of

ideological sophistication, ideas flowing from highly committed interpretations of commercial practice are rephrased into universalistic value formats, by business associations, chambers of commerce and specialized institutes and similar elite economic organizations – there is a link here with the complex of elite law firms and specialized lobbyists representing business interests that cluster around centers of political power to 'mold the democratic process.' Increasingly, as market relations penetrate cultural production, economic discourses supporting business interests are conceived on contract by researchers working in 'think tanks' financed by grants from (often conservative) corporations. Indeed, wealth can produce its own 'science' by hiring consultants, sidelining studies that do not conform and widely publicizing those that do. Ideas and personnel continually move among business, academic, and quasi-academic institutions and the higher reaches of governmental bureaucracies, especially the treasuries and departments of finance, where real state economic power resides.

Some of the ideas propagated by academic and institutional agents, and processed into policies, are picked up by the information media – especially, in the economic case, the business sections of respectable, national and international newspapers, economic dailies or weeklies, popular magazines, news and commentary shows on television and radio (so powerful now that they form their own interest group with autonomy from the rest of the business world). For example, the nightly news carries brief sound bites from a small circle of 'responsible' think-tank experts that serve to anchor stories in 'the truth.' The media comment on policy from the perspective of their own economic interest as big corporations, but also help decide among competing policy directions by responding 'on behalf of' public opinion. Here we find the clearest links with commodification and the advertising revenues that underwrite the apparent neutrality of 'all the news that's fit to print' (or more cynically 'all the news that's fit to surround advertisements'), although my claim is that the entire discursive process, from ideological conceptualization to policy implementation, is structured by class, gender and ethnic power interests.

These ideas are formed into practical policy in political power centers, where government and governance institutions cluster, and high-powered experts endlessly 'circulate.' These centers of global power are exclusively cities in Western capitalist countries: either the capitals of leading national powers, overwhelmingly New York (for example, the United Nations) and Washington, DC (the International

Monetary Fund and the World Bank), or definitely Western, but officially neutral, political spaces, as with Geneva, Switzerland (the World Trade Organization and many UN agencies). So in terms of its geography, 'global' has come to mean the spatial expansion of the field of the exercise of power accompanied by the spatial concentration of control in a few Western cities. In the twin terms of class and space, a few thousand people, clustered in a small space, control the lives of billions of others, the world over.

The regulatory space, or hegemonic extent, of a dominant theoretical and policy discourse comes from its ability to persuade or coerce institutions of power across broad swathes of territory, where policy practices might otherwise be conditioned by narratives, discourses and theories deriving from greatly different interpretive traditions applied to diverse regional experiences and varying needs – for example, basic needs in developing countries as compared with wants and desires in developed countries. Discourses produced in these centers of power achieve hegemonic extent by exerting discipline (persuasion, coercion and the power of practicality) over spatial fields of influence – in this way they become 'globally hegemonic discourses.' The boundaries of a global hegemony are extended and reinforced by a series of formal-institutional mechanisms. Political/military interventions enforce adherence at times of crisis, when competing hegemonies collide in geopolitical space. Cultural/media systems are particularly adept at extending the boundaries of possibility for economic domination. Hegemonies are mostly policed by policy means, as when structural adjustment forces borrowing countries to adopt hegemonic models of economic growth. Hierarchies of centers of persuasion organize spatial flows of policy discourse that result in a series of articulations between universal and regional discursive formations. These diverse articulations, between the global and the local, can be described using a set of geopolitical terms that combine the political-discursive-rational dimension with the geographical-organizational-power dimension. So hegemony takes the following geopolitical forms: the dominant hegemony, produced in leading cultural-political-economic centers of symbolic production – I will argue that these are located in financial rather than political capitals; the sub-hegemonies yielded by processes of translation as dominant hegemonies are imposed in modified formats in relation to the contexts provided by local circumstances; the global hegemony produced through relatively stable correspondences among a hegemony and its various sub-hegemonies; and counter-

hegemonies that confront both global hegemony *in toto*, and its various sub-hegemonic forms (Peet 2002, 2007).

Counter-hegemony

Globally hegemonic discourses are confronted in the peripheries by alternative conceptions deriving more directly from the experiences of oppressed peoples. As the Marxist cultural theorist Raymond Williams insisted, 'the hegemonic' is neither total nor exclusive. Rather oppositional cultures continue to exist. For Williams (1977: 125), these alternatives may be 'residual' – based on experiences lived in the cultures of previous social formations; or 'emergent' – in the sense of the creation of new meanings and values, new significances and experiences, that are not fully incorporated into the dominant. Even with intensive globalization, different spaces exist in discontinuous time sequences, so that oppositional groups contend with the residues of dominations discarded elsewhere or, more realistically, long integrated into synthetic, new kinds of domination – contentions with feudal social formations, for instance. Continuing exclusion from material benefits is the main experiential base projecting residual resentments into emergent alternatives as fully fledged counter-hegemonies. Intellectuals marked by class, ethnic or gender difference often serve as spokespersons for what otherwise can amount to sullen resistance, or defiance phrased in narrative forms restricted to a local culture. These intellectuals have their own bases in alternative power complexes, situated around social movements or unions, and often represented locally and internationally by non-governmental organizations (NGOs), different in that they employ more informal media of thought, discussion and dissemination. Sometimes counter-hegemonic formations receive limited financial backing from liberal funding sources in the center. They have their own media outlets, both directly, as with committed, leftist publishers, or (more precariously) indirectly, as with conventional media that see profit potential in the residues of the real expressed by protest movements.

In the process of translation, as radical academics or liberal professionals translate emotion, anger, poems, songs, testimonies and assertions based in residual resentment into rationalized policy prescriptions, press releases, books and lots of scholarly articles that represent emergent counter-hegemonic discourses, some degree of disciplining is inevitable. The very process of translation from popular narrative into formal discourse is part of what might more

generally be termed 'colonization' – the tendency for the hegemonic to penetrate and control the counter-hegemonic. Translation nearly always involves reimagining local grievances, and ideas for solutions based in interpretations of local experience, in terms of outcomes already intellectualized in the various liberal, social democratic and socialist traditions that formed the oppositional counter-hegemonies in the established centers of Western critical thought. Important too is intellectual capturing, especially of the radical academic mind, by grants, institutional recognition, media coverage, Western championing and invitations to visit Harvard for a corrupting while. The uneasy articulations between sub- and counter-hegemonies yield ranges of contradictory locations, hybrids that result in sudden shifts of allegiance as contexts, opportunities and life choices change. Contestations between the hegemonic and the counter-hegemonic are, however, still punctuated by episodes of violence, with riots that leave bodies dead on the streets. This is because counter-hegemonic discourses more fundamentally derive their persuasive powers from the collective wills of oppressed peoples, from the experiences of the poor and downtrodden, from pangs of hunger and the cries of sick children, from the loss of respect in the death of a culture. It is on behalf of the dispossessed at the margins that acts of spectacular violence penetrate into the heart of hegemony.

The rest of the book

This book uses ideas of power, political interest, hegemony, discourse, responsibility and the power of practicality to examine critically three global governance institutions: the International Monetary Fund (IMF), the World Bank and the World Trade Organization (WTO). All three institutions play roles greatly different from those originally agreed under the charters that set them up. Indeed, we argue that a shifting stance with regard to governance is inevitable, because there lies at the heart of the present policy regime a contradiction that constantly threatens to rupture its hegemonic order. All three govern an economy that their neoliberal ideology insists is best left institutionally ungoverned. This contradictory position leaves global governance open to diverse but powerful criticisms. From the right, and largely within hegemony, more extreme versions of neoliberalism insist that economic problems are best left for self-adjusting, free markets to solve. From conservative allies comes the criticism that private associations can better solve economic problems. From

the nationalists they hear the refrain of global totalitarianism. From democrats they learn that no one elects them. From the counter-hegemonic left they are assaulted for the policies they impose on victim peoples. What's an institution to do? In what follows, we take a historical approach to critical understanding, believing that the policies presently followed by these three institutions derive from a considerable record of experiments, retreats, reassertions and yet the overall accumulation of power and influence. All three have achieved positions of seeming permanence by assuming a stance that combines institutional rigidity with procedural fluidity. Or, to put it more critically, and referring especially to recent years, all three have learned that a little spin and some confessions of partial failure ('we have a lot to learn') excuse many abuses in the exercise of power.

Chapter 2 looks at the political and economic conditions that made possible the Bretton Woods conference setting up the IMF and the World Bank. The chapter deals with two types of conditions: the conditions of political economic reality dominated by the decline of British geopolitical domination, the exigencies of the Great Depression and the rise to world power of the United States; and the conditions of economic theory, especially the breaking of the sanctity of the classical–neoclassical paradigm and the rise of the Keynesian amendment. These two great changes intersected in the formation of a kind of global Keynesian club, the Bretton Woods institutions, the international financial institutions (IFIs) designed to regulate international economic relations in such a way that the world would never again suffer the threat of total disruption. The institutional framework of the new global hegemony might seem to have come from consultation and discussion among equal-member nation-states. The historical reality is quite different. Of all the 'great powers' the USA had been most averse to being ruled by anything resembling an independent institution. So the chapter records, in some detail, how the USA came to dominate the post-war international economic agenda. The IMF and the World Bank, the chapter argues, were set up as US-dominated institutions, as collectivist fronts for US international economic policy – arms, some might say, of a new world order characterized by a more subtle, effective imperialism.

Chapter 3 reconstructs the history of the IMF, the more powerful of the two Bretton Woods institutions. The IMF was originally concerned with exchange rates and balance of payments loans, important but relatively uncontroversial aspects of international financial regulation.

IMF short-term loans were at first used mainly by the same circle of industrial economies that had dominated the institution's founding. The IMF shifted in the mid-1970s to a more interventionist stance in which loans were granted under conditions of greater austerity increasingly to Third World countries. Loan 'conditionality,' I suggest, was based on a particular, ideological conception of how countries achieve economic growth. This conception, in turn, was formulated by right-wing politicians and bureaucrats operating mainly through the US Treasury in a series of Republican administrations in the 1970s and 1980s. The results of neoliberal conditionality, together with other related policy moves, such as capital account liberalization, have been disastrous for working people. Discontent beginning as food riots has escalated into massive popular protests whenever the Fund tries to convene. In response, the IMF has superimposed a veneer of concern on its base of austerity, in the forms of debt relief, anti-poverty programs and public participation. Critical analyses suggest that these are more spin than substance. The chapter concludes by noting the significant decline in the power of the IMF in the years since its mishandling of the East Asian crisis.

Chapter 4 recounts the tragic loss of the potential inherent in what became a global development bank. The World Bank's early, limited role was as minor actor in the reconstruction of a war-torn Europe – as the International Bank for Reconstruction and Development. In the 1950s the institution's focus shifted toward project lending in the richer Third World countries. But in the 1960s and 1970s, with the formation of the International Development Association under Bank auspices, and at a time of social upheaval and transformative political possibilities, poverty alleviation and rural development under a basic-needs strategy became the Bank's main preoccupation. While this sounded better in developmental rhetoric than it resulted in policy practice, the real tragedy for the World Bank did not arrive until the later 1970s. Faced with a distinct rightward shift in political conditions, the Bank became involved in structural adjustment employing neoliberal policies, increasingly in concert with the IMF. The Bank also came under increasing criticism for the carelessness of its project lending and for the damage done too by its broader structural lending. So far the Bank's reaction, in terms of public participation and liberal reform of policy, has again been superficial. Yet the World Bank is the conscience of the international governance structure and also its weak spot, mistrusted by the right, lamented

by the left. It too has gone through crisis in recent years, although so far it has been saved by adding to the smily face of its conscience responsibility for adjudicating whether the Millennium Development Goals are being reached.

Chapter 5 presents a brief history of the political, economic and ideological conditions behind the initial formation of the GATT. It summarizes the various rounds of subsequent GATT meetings culminating in the Uruguay Round, signed at a ministerial meeting in Marrakesh in 1994, which greatly expanded the scope of trade agreements, and formed the WTO. The chapter examines the organizational structure of the WTO as administrator of what became a complex set of institutional procedures governing international trade. We then subject the WTO to sustained critical interrogation: its trade policy review mechanism is examined as an instrument of neoliberal discipline in a restrictive discursive space; its dispute settlement record is perused to see whether free trade is consistently preferred over environmental regulation; its attitudes toward labor are surveyed to detect class biases; and its TRIPs agreement is analyzed to see the potential cornering of ideas by multinational corporations. The chapter then looks at the various kinds of opposition to the WTO, with an emphasis on the eruption of protest in Seattle, 1999. It concludes with an overall, critical assessment of the WTO, also an institution in crisis to the degree that its main decision-making body, the Ministerial Conference, can scarcely meet anymore.

Chapter 6 places the current problems encountered by the three institutions in the context of the more general crisis of capitalism. The chapter argues that global finance capitalism is a new social formation replacing corporate industrial capitalism in the late twentieth century. It results from a massive redirection of income flows toward the rich that occurs under the presently prevailing neoliberal policy regime. The chapter provides what might be called a socio-psychology of contemporary finance, particularly its systemic drive toward risk-taking and speculation that led to the crisis of 2007/08. But even mad, speculative societies have a conscience, and this is expressed in a global anti-poverty discourse that forms a conspicuous part of the global financial system, including the international financial institutions that form the focus of this book. A corrupt economic system necessarily means, however, that expressions of benevolence turn into anti-poverty policies characterized more by 'bene*violence*.' Policies directed by the IFIs aimed apparently at forgiving Third World

debts and 'ending poverty now' result in the opposite – inclusion in a global economy riddled with impossible levels of debt and, if anything, higher levels of debt and increasing insecurity. We look at the destabilization of an unraveling ideological hegemony in times of rising crisis and counterpose some alternative principles that might guide a revitalized movement for global justice.

TWO

Bretton Woods: emergence of a global economic regime

While the world was still engaged in the Second World War, forty-four nations, led by the USA and the UK, met at Bretton Woods, New Hampshire, on 1–22 July 1944, to discuss economic plans for the post-war peace. Governing the international economy was an idea made possible by the anarchy of the inter-war period. In reaction, governments sought to secure world peace and prosperity through international economic cooperation. Such cooperation would be based on a world market, in which capital and goods might move freely, regulated by global institutions operating in the general interests of greater stability and predictability. Three regulatory institutions were envisaged: the IMF, the International Bank for Reconstruction and Development (IBRD, later known as the World Bank), and an International Trade Organization (ITO), which came into being only as the General Agreement on Tariffs and Trade (GATT), but much later became the WTO. The IMF and IBRD were formalized as organizations during the Bretton Woods conference, while the proposal for an ITO was part of a separate Havana Charter of 1947.

This chapter looks at three aspects of the emergence of the new global economic accord. First I look at the political and economic conditions prevailing in the West between the late nineteenth century and the middle of the twentieth, the idea being to contextualize expressions of collective concern about the capitalist economy that led to Bretton Woods. Second, I outline the economic perspectives dominant at the time, from the intersection of which Bretton Woods policies emerged as a governance system for a world in crisis. Third, I look at the political economy of the conference itself, and the Bretton Woods model that resulted. Needless to say, these three lines are intertwined. My approach is historical-interpretive and historical-constructive. For the most part I accept the universalistic discourse composed of statements of international accord that were used to justify the formation of the Bretton Woods regime. Only at the end of the chapter do I interpret these statements more critically, the aim

being not merely to show how the Bretton Woods institutions came into being but, more importantly (for that tale has been told before), how the geopolitical conditions of global hegemony changed, and how the discourses that responded to a capitalist world in crisis at the time 'constructed' the post-war international economic regime.

In describing the global system planned at the conference, several authors whose work I respect use the term 'regime,' as in the phrase 'Bretton Woods regime.' International regimes, in this conception, are the sets of rules and conventions governing relations among nations (Cooper 1975: 64). Or, in Ruggie's (1982: 380) view, regimes are 'social institutions around which actor expectations converge in a given area of international relations.' In this perspective, international regimes legitimize the policies and obligations of actor states with regard to a global order. They are concrete forms of the 'internationalization of political authority' – with 'authority' understood, in Max Weber's sense, as resting on a 'form of legitimacy' that derives from a 'community of interests' (ibid.). I prefer the term regime to 'system' or 'order,' two other terms often used, as the arrangements made were sometimes neither systematic nor orderly (Cooper 1975). I find the ideas of regime, communities of interest and forms of legitimacy compatible with our own terms 'hegemony' and 'discourse.'

Political-economic context

What we now call modern 'globalization' – an intense interchange of people, ideas, capital and technology across international space – came into existence during the Pax Britannica, roughly between 1875 and 1914. This was a period of relative peace in which liberal consciousness, with its faith in the natural progress of reason, rationality and the rule of law, combined with an assumption of racial superiority to justify European economic and political domination of large parts of the non-industrialized world. This world was tied together politically by imperialism and economically by trade, investment and flows of technology. In the fifty years preceding the First World War, global exports rose from $550 million to $19.8 billion; the value of world trade rose by an average of 34 percent per decade; and its volume rose by 36–37 percent each decade (Eckes 1975: 2). Most trade remained inter-European, with the colonies serving mainly as sources of raw materials.

International monetary exchanges at this time were based on the gold standard. The rules were simple: each national currency (the

amount of money in circulation) was backed by a quantity of gold held by the country's central bank. Currencies were, at least theoretically, freely convertible into gold, which was allowed to cross borders without restrictions. Under these conditions, in Eckes's (ibid.: 5) sparse words, 'trade-and-payments imbalances induced gold transfers, and gold flows automatically altered internal prices and incomes so as to restore payments equilibrium.' The economic system prior to the First World War was considered 'free' in the sense of being self-regulating, with 'natural' flows of money and capital. Britain was the dominant industrial and mercantile power. Its economy was completely intertwined with the world economy. Britain was the largest exporter of industrial products, financial capital and commercial and transport services, while forming the main market for agricultural goods. Britain sustained the international economy by paying for its surplus of imports from its 'invisible' financial and commercial services and overseas investments (Hobsbawm 1987). As the central importer, Britain provided other countries with a means of earning sterling (pounds – originally of silver) that served as the global currency.

On the eve of the First World War, Britain lost clear political and military superiority in relation to France, Germany and Russia. Contradictions surfaced between an increasingly hostile international political environment and an increasingly integrated international economy centered still on Britain. Meeting at Versailles after the First World War, the victorious Allies were mainly concerned with the political environment – issues such as national boundaries, colonies, security and indemnity. The economic environment, as with currency or trade issues, was hardly discussed. US President Woodrow Wilson said, on his way to Versailles, that he was 'not much interested in the economic questions' (Eckes 1975: 9). Faith was preserved in the classical economic liberalism of Adam Smith, in which the self-regulating market tended toward a socially acceptable equilibrium without explicit governmental intervention. The growing complexity of industrial society – characterized by organized labor, the beginnings of social welfare programs and intricate taxation systems – and the complications of the growing interrelations between national societies could only confound those faithful to classical economics beliefs.

Governments assumed that by reverting to the pre-war gold standard, business would simply continue as usual. Yet in the years immediately following the war, the capitalist world economy entered

a really difficult time. State treasuries were burdened by the cost of the war, which had far exceeded expectations. Moreover, Britain could no longer maintain a position at the center of the international economy. With laissez-faire economic policy, and the apparent detachment of politics from economics, came another dissociation, that of domestic economies from international economies. At times of crisis especially, countries sought to protect domestic production regardless of the effect on other countries ('beggar my neighbour' attitudes). Furthermore, during the war, the gold standard and currency convertibility, which regulated the price structures of independent markets, had been suspended. To mobilize domestic economies, governments printed inconvertible paper money, depreciating the values of national currencies. This resulted sporadically in massive inflation and unemployment.

Then, in October 1929, the prices of basic foodstuffs and materials lost between two-thirds and three-quarters of their value, undermining the already tenuous economies of every country linked with the liberal international regime. Between 1932 and 1933 unemployment in the USA reached 27 percent, and in Germany 44 percent (Hobsbawm 1994: 91–3). Unemployment and union activity were seen as internal threats with the potential for undermining social normality, stability, peace and what little economic prosperity remained. At the same time, and in contrast to the failing economic liberalism of the Western countries, the USSR was rapidly industrializing. Its state-planned economy seemed immune to the crises plaguing capitalist nations. Communism was seen by many working-class people as a viable alternative. Soon, fascism would present another alternative. By comparison the various capitalist countries reacted to international crisis nationalistically by devaluing their currencies, and thereby increasing their (cheaper) exports, in attempts to shunt the effects of depression elsewhere. Capitalist governments were therefore confronted with two difficult tasks. Something had to be done to lessen the effects of economic catastrophe. And the hegemony of the capitalist system had to be protected from the external threats presented by communism and fascism.

In response to these growing problems, the inter-war period saw the first signs of international economic collaboration among the developed, capitalist countries. Motivation came mainly from bankers rather than governments, which (following a liberal ethos) initially tried to avoid direct intervention in explicitly financial international

affairs. Far more aware of the effects of national interest rates, for example in attracting or repelling capital, bankers advocated some kind of international cooperation. Eventually, the quasi-autonomous central banks were more involved than official politicians in resolving international economic matters. For example, the German reparations payments, made under the Dawes Plan of 1924, were negotiated by the chairmen of the boards of the New York Federal Reserve Bank and the Bank of England. The League of Nations remained primarily a 'political' organization. But it did maintain an Economic and Financial Organization, and it sponsored a series of international conferences in various European cities between 1920 and 1933 (Heilperin 1947: 147; Eckes 1975: 11–12). In these we can see forming the beginnings of ideas about establishing some kind of global regulatory institution.

An international bank to aid post-war reconstruction was first proposed at a conference in Brussels in 1920. Another proposal, to restore the gold standard, stabilized via central bank cooperation but managed by an international convention, was discussed in Genoa in 1922. In the mid-1920s the League of Nations helped arrange loans to stabilize the economies of several European countries. An international economic conference, convened by the League at Geneva in 1927, and attended by several non-member countries such as the USA and the Soviet Union, came up with a series of resolutions dealing with trade, cartels and other issues that were thought to constitute an international code of behavior in policy matters. Discussion of a Bank for International Settlements took place in 1930 in The Hague. A World Economic Conference attended by sixty-six nations was held in London in 1933 in a desperate attempt at dealing with mounting problems – as with Britain abandoning the gold standard in 1931. The conference could not escape the classical principles that had guided economic policy in the past: it called for governments to balance their budgets, remove controls on the free movement of goods and capital and return to the gold standard. An appeal to the USA for help in restoring the gold standard was met by rejection – with President Franklin D. Roosevelt excoriating 'the fetishes of so-called international bankers' (Pauly 1997: 65). Eventually the conference dissolved in disarray. The usual explanation for the failure of these international agreements to establish a new global economic regime is that there was no world hegemonic power capable of occupying Britain's pre-war position – saddled by war debts, Britain was incapable, and the USA as yet unwilling. We might also add to the list

the depth of the crisis, the utter inadequacy of classical or neoclassical approaches to economic issues, the continuing divorce between economics and politics in the (nineteenth-century) liberal imagination, and the inherent tendency for international rivalry in (competitive) capitalist systems undergoing crisis.

What ended the inter-war economic crisis was neither conference nor global economic management, but the Second World War. Mass modern warfare requires mass modern production, carefully planned by the state, which was also the primary consumer of the machinery of warfare produced. Moreover, production was for readily apparent, immediate, political objectives, rather than market-oriented consumption. The war thus brought back together economics and politics which classical liberalism had long separated. The stage was set for Bretton Woods.

Discourses of economy

Even catastrophic events do not produce discourse directly. Discussions of policy need a language and a set of concepts, a discourse founded on economic theories. On the one side, the discourse of Bretton Woods can be traced back to classical political economic ideals (Hirschman 1945). Bretton Woods was a reaction to the (state) protectionism of the 1930s, just as classical political economy was formulated in reaction to the protectionist economy of mercantile capitalism. Adam Smith, it might be recalled, thought that the gain of one nation was not necessarily based on the loss of another. On the contrary, all nations benefited when they traded with each other in a free world market. Further, in the global division of labor, international trade brought about interdependence – that is, the dependence of each nation on the whole world system. Interdependence imbued each country with relative power. No one nation would have absolute power over the whole system. From trade, then, developed a uniform system of power balances. The relation between trade and peace, or economic exchange and political power, was present also in the thought of the British political economist J. S. Mill – commerce not only brought about peace, but also rendered war obsolete.

The classical notion that trade prevents war and brings about peace was present in the Bretton Woods project. Bretton Woods was conceived during a planetary war of unprecedented proportions. The fighting countries longed for peace. Practically, Bretton Woods, and the resulting institutions, were supposed to prevent further wars.

This classically based view, however, assumed mutual dependence, reciprocity and relative equality in economic and political-military capacity among nation-states. Such conditions were definitely not the case in the post-Second World War period. With political-economic inequality, international trade becomes an 'instrument' of national power (Hirschman 1945). That is, one nation-state uses the entire system to subordinate other nations that are weaker economically, for example through unequal trade, which makes less developed nations dependent on more developed ones.

In the post-war years, until the present, the latter kind of geo-political economic conditions have realistically obtained. As we mentioned earlier, dependence already characterized relations between North and South, whereas the communist East was becoming completely independent from the West. Under these circumstances, the equality of the classical liberal perspective could have applied only to the countries of western Europe and North America, perhaps only to the USA and the UK, and even there, as we shall soon see in greater detail, the term 'equality' is a subterfuge. We argue, therefore, that Bretton Woods was conceived in a world already characterized by relations of severe inequality, especially in terms of economic development. Nevertheless, in the Bretton Woods discourse, the world was publicly described in terms of the free market with sovereign autonomous states enjoying equal opportunity in an 'open international system' – that is, a politically neutral market (Blake and Walters 1987). Yet Bretton Woods also represents the aggressive desire of the capitalist market to expand globally beyond the boundaries of the developed industrial world. Owing to the influence of Keynes, however, such an expansion had to be regulated and controlled – the market should not be left to its own whims, and all nations should participate in regulating its forces. And these are only a few of the political-economic complexities of the times!

The idea of political intervention in the market had been present, to a limited degree, in classical political economy. Governments might intervene in cases of market failure, to provide public collective goods, or, according to Smith, in case of monopoly, which disturbs free competition. Liberal economists basically believed, however, that there were no necessary connections between economic growth (based on markets tending naturally to equilibrium) and political developments – in their view, economics was progressive, while politics was regressive (Gilpin 1987: 30). Moreover, national economic growth benefited

from international flows of goods and capital. The integration of a society into the world economy therefore enhanced national economic welfare. Liberal economic theory supposed an international division of labor and a market that arose spontaneously and harmoniously among states. Such a system presented problems to some liberal economists, especially in terms of a hegemonic economy governing the world economy, institutions to regulate it, or both. That is, for some, markets could not regulate themselves, and could reach neither equilibrium nor stability when left alone. Markets were intrinsically unstable.

Classically, liberal economists were also aware that the free market (conceived as free exchange among equals, unaffected by differences in power and political factors) did not benefit everyone and that not everyone gained equally (in the short run at least, before the market reached absolute equilibrium – ibid.: 180). The argument for free trade was instead based on maximizing global wealth and increasing efficiency, not on equity or equal distribution. The latter issues were not primary concerns for classically liberal economic theorists – equity issues were left to sociologists and other 'soft' social scientists. Notwithstanding this disregard for social justice, it was still argued that the liberal economic system was the ultimate model, and that its breakdown led to 'disharmony' and 'economic conflict.' In the liberal economic system not everyone gained, nor everyone gained equally, but without the system no one gained at all (ibid.: 45).

This brings us to the second side of the issue – state intervention in the economy. Interest in Keynesian policy, understood as the political management of domestic economies, developed as faith in the self-regulating market faded during the Depression of the 1930s. As we mentioned briefly in Chapter 1, John Maynard Keynes, in *The General Theory of Employment, Interest and Money* (1936), argued that the general level of employment was determined by the demand for goods and services in the entire economy. Assuming that the government had a neutral effect, two groups influenced aggregate demand: consumers buying consumption goods; and investors buying production equipment. Consumers increased spending as incomes rose, although by a smaller proportion (consumer credit was a potential yet to be fully realized by banks and governments): consumer spending was not, however, the key variable in explaining the overall level of employment, for consumption depended on income, which in turn depended on something else. In the Keynesian system, real

investment (new factories, tools, machines and greater inventories of goods) was the crucial variable: changes in real investment fed into other areas of an economy. And real investment resulted from decisions made by entrepreneurs under conditions of risk. Investment could be postponed. The decision to invest, Keynes said, depended on comparisons between expected profits and the prevailing interest rate. Here the key variable was 'expectation' or, more generally, the degree of investor confidence. The interest rate Keynes explained not in terms of savers postponing consumption, but in terms of speculation about future stock prices, which in turn determined interest rates, as savings moved from one investment fund to another. Productive investment again depended essentially on expectations about the future. Investors bought machines, providing income to machine-builders (companies and employees), who, in turn, spent money, further increasing national income, with the 'multiplier effect' (the degree of economic expansion induced by an investment) varying with the proportion of additional income that was spent rather than saved, and so on; a decrease in real investment had the reverse effects. The government might influence this dynamic by changing the interest rate, by deficit spending and other fiscal policies, shifting the economy from one equilibrium level to another, generally to higher employment levels. Depression could be countered by states maintaining low interest rates through central bank intervention, although Keynes doubted that this would be sufficient significantly to alter business confidence and thus investment. Additionally Keynes was for the redistribution of wealth through taxation, mainly with the purpose of increasing the propensity to consume, and the augmentation of private investment by government spending and deficit budgets ('pump priming'). Subsequently, the more conservative Keynesian economists have seen the manipulation of interest rates as a relatively non-bureaucratic, non-intrusive method by which the central bank of a country tries to influence national income and employment – an alternative being the ever-popular tax reduction. Liberal (New Deal-style) Keynesian economists see government deficit spending as a more effective measure: the 'liberal' aspect being that deficit spending can be aimed at improving social services. Keynes proved theoretically what depression had long shown in practice, that free markets did not spontaneously maximize human well-being. While Roosevelt first dismissed Keynes as a mathematician, rather than a political economist, Keynesian policy became the foundation for the

New Deal program in the USA in the late 1930s. Keynesian economists and administrators flooded into the governmental bureaucracies that ran the war effort in the early 1940s, while Keynesian influences were felt (through the influence particularly of economist Alvin Hansen) in several recommendations for social programs in the post-war period, including the US Employment Act of 1946 (Collins 1981).

The question was how to expand Keynesianism to the world scale. The belief grew that governments had to assume collective responsibility for managing the international economic system, and that one country, the USA as it turned out, had to assume the responsibility of global leadership. In reaction to the traumas of the Great Depression, Western democracies had to 'resolve the clash between domestic autonomy and international stability' (Gilpin 1987: 131; see also Cooper 1975: 85). With the post-war objectives of hegemony through economic growth and full employment on a national scale, governments had to commit to intervening in national economies and establishing welfare states. Yet also, in contrast to the inter-war period, governments were responsible for creating a stable international economic order and preventing a return to the destructive economic nationalism of the 1930s. As a result, the new international economic regime would differ from the laissez-faire regime of the nineteenth century and the protectionist regime of the 1930s. In contrast to the prevailing situation under the liberalism of the nineteenth century, the governments of nation-states would have a greater role in the economy, subject to international rules, in a compromise between domestic autonomy and international norms. Contrary to what happened in the 1930s, the new regime would appeal to the consent and cooperation of member nations, but would also commit them legally. And it would also recognize the mutual obligations of countries with balance of payment deficits and surpluses. In summary, there would be balance between national and international stability without subordinating one to the other, with institutions devised to manage and resolve international economic conflicts, and hence assume regulatory force in the international market. These institutions would assume the role of the state in a global market economy.

The USA: from isolation to global hegemony

Between the two world wars, the battered US economy was still in a better shape than the European economies. Moreover, the USA had a huge base of natural resources on which it could depend, and

a separate sphere of influence in the western hemisphere. These conditions had served initially as bases for the geopolitical and geo-economic isolation of the USA from Europe. Such conditions were strengthened further by the protection-mindedness of American businesspeople and farmers and the US Congress. As part of this, international economic policy was never left entirely to the American president. Rather, decisions had to be approved by Congress (Spero 1985). Isolationism at all levels left the USA with little political inclination for world leadership.

The US attitude toward European financial troubles immediately following the First World War exemplifies this. The US government had entered the war hesitantly, with general popular reluctance, and protest from leftist unions. Those favoring entering the war, the so-called internationalists, were often led by corporate affiliates, whose long-term goal was to erode the prestige of the London financiers. The internationalists, however, were not rewarded by new domestic policies after the war. The US Congress would not agree that the USA should enter the League of Nations (Block 1977: 17–19). Without the international experience of the European colonial powers, American politicians failed to recognize the specifically economic ramifications of their nation's strength after the First World War, when the European economy faltered. The US economy in the 1920s and 1930s consistently had an export surplus, with European products hardly intruding into the American market, which made it difficult for European countries to earn the necessary dollars to pay the interest on their war debts (ibid.: 21). US protectionist policy remained an obstacle to trade liberalization. Moreover, US actions, when they did occur, often had adverse effects. The US insistence that Britain and France repay war loans, in the context of limited access to US markets, forced the European nations to pressure Germany for reparations. Isolationism contributed to causing the Second World War.

The USA emerged from the Second World War, however, ready not only for participation, but also for international leadership (Scammell 1980). American post-war policy, and hence plans for a 'reordered world economy,' can be seen, partly at least, as a reaction to American isolationism of the inter-war period (Frieden and Lake 1991). For Spero (1985), the Europeans were haunted by the memory of the late entry of the USA into both world wars. The Europeans feared US isolation far more than its domination. For its part, the US had come to understand its previous isolation, and failure of leadership,

as a straight road to the collapse of the world economy and communist victory. Eventually, it was assigned, by the Europeans, and by its own fears, primary responsibility for establishing a stable international political and economic order. When the USA bound itself to international commitments, it did so from a pre-eminent position, and ensured that the commitments made conformed to American interests. As one authoritative study puts it: 'the United States has viewed all multilateral organizations, including the World Bank, as instruments of foreign policy to be used in support of specific US aims and objectives' (Gwin 1997: 195).

The conference held at Bretton Woods was made possible, according to Spero (1985), by three conditions. First, power was concentrated, with a small number of states, in North America and western Europe, making decisions for an entire world system. The communist eastern Europe states, with their centrally planned economies, maintained deliberate policies of isolation from the world economy, and eventually had their own 'international' regime. The dominant Euro-American states were also not challenged by countries in what came to be called the Third World, a great number of which were still emerging as independent states. Instead these countries were fully integrated into a world economy they neither managed nor controlled. And weakened by the war, Japan remained subordinate and external to management and decision-making. Concentration and exclusion facilitated the management of the system by confining the number of actors. Heilperin (1947) makes a similar claim, attributing the success of the Bretton Woods conference to the exclusion of most countries from planning and preparation. Accordingly, in successful conferences, key countries should reach prior 'substantial agreement' and then generalize the results to other countries, with slight amendments and improvements. Another author, Dunn (1992), goes farther and contends that the success of Bretton Woods in creating the IMF and the IBRD was due to the fact that countries other than the USA and Britain did not have a chance to include their 'different points of view' about the set-up of the resulting institutions.

The second condition making Bretton Woods possible resided in the common interests shared by the powerful states, mainly their beliefs in capitalism and, specifically, by the end of the Second World War, classical liberalism tempered by Keynesianism. States differed in their degree of preference for state intervention, with France advocating more governmental planning, and the USA preferring limited

planning, once the war was over. Nevertheless, the economies of all states relied fundamentally on market mechanisms, with private ownership and minimal barriers to the flow of private capital. They all agreed on a conception of the 'common good': the bringing of international peace through maximization of economic welfare, with political and military security being of primary importance.

The third condition was the new willingness, and ability, of the USA to assume leadership. After the Second World War, the American economy enjoyed a huge, growing market, particularly in consumer goods, great productive capabilities, and a strong currency. Combined with American military might, especially atomic weapons, this provided the advanced capitalist economies, and the world system they were planning, with a leading power. American hegemony and internationalist (capitalist) ideals became, for the USA, inseparable. The imposition of their vision, other than being based on economic and military strength, was complemented by older plans to 'break the British bloc' and turn the UK into a 'financial satellite,' while British weakness after the Second World War made it difficult to resist American plans presented at the Bretton Woods conference (Calleo and Rowland 1973). After all, at the end of the war, the USA owned three-quarters of the world's existing monetary gold, still the bedrock of currency stabilization. According to Eric Hobsbawm (1994), the institutions emerging from Bretton Woods were de facto subordinated to American foreign policy.

The conference

The United Nations Monetary and Financial Conference hosted by the US Treasury Department at Bretton Woods in 1944 brought together delegates from forty-four allied and associated nations and a neutral country, Argentina. Henry Morgenthau, secretary of the US Treasury, hoped to make Bretton Woods a high-level conference attended by finance ministers to add political weight to the final recommendations. But owing to war conditions, and other political concerns, only fifteen governments, including those of Belgium, Brazil, Canada, China and the French Committee of National Liberation, sent their finance ministers. Lord Keynes chaired the British delegation. M. S. Stepanov, deputy commissar of foreign trade, led the Soviet delegation. Senior diplomats from central banks chaired most of the remaining delegations. Alongside the leading economists of the time, however, were government delegates with few of the qualifications nec-

essary for a conference of that significance. Guatemala, for instance, sent Manuel Noriega Morales, a postgraduate student in economics at nearby Harvard University (Eckes 1975: 138). Some of the delegates were well acquainted with the complex documents to be discussed. Most learned of them only during the conference. Moreover, many delegates did not speak English, the official language of the conference, and the sophisticated issues discussed remained unintelligible to many. 'At Bretton Woods, representatives of forty-four delegations signed the agreements without having the time or opportunity to read them' (Van Dormael 1978: 226). Keynes described the conference in the following arrogant terms: 'twenty-one countries have been invited [to Bretton Woods] which clearly have nothing to contribute and will merely encumber the ground … The most monstrous monkey-house assembled for years' (Sanderson 1992: 30).

Even so, Bretton Woods merely formalized previous agreements between the British and the Americans. The conference followed two and a half years of negotiations between the treasuries of the USA and the UK. (The US Treasury Department was at the time assuming control over international economic policy, previously the domain of the more political State Department, particularly in the areas of international monetary, financial and taxation policy – Cohen, S. 1981: 47–58.) According to Raymond Mikesell (1994: 34), economist from 1942 to 1947 in the Division of Monetary Research, US Treasury Department: 'Bretton Woods was a drafting meeting, with the substance having been largely settled previously by the U.S. and U.K. delegations supported by the Canadians.' Even further, financial agreements between the USA and the UK were based on prior political agreements between President Franklin Delano Roosevelt and Prime Minister Winston Churchill. These arrangements constituted a hidden agenda for the Bretton Woods meetings. Through a succession of bilateral agreements, the USA and the UK worked together toward forming a 'world with expanding trade and easily convertible currencies' (Eckes 1975: 79–80), a world that matched their own economic interests as industrially dominant powers.

There were, however, some differences in what I previously called economic discourse. During the negotiations leading up to the conference, the vision of Harry Dexter White, director of the Division of Monetary Research, and deputy in charge of International Financial Problems, US Treasury Department, confronted that of Lord John Maynard Keynes, finance minister of the UK, and chief architect of

British economic policy. The USA pursued trade freed from imperial preferences ('free trade') which would effectively open markets to American exports. The UK wanted to maintain the sterling area as a sphere of privileged interests, but was concerned too about financing recovery in the post-war period. Negotiations between Roosevelt and Churchill, the Atlantic Charter (August 1941) and the Anglo-American Lend-Lease Agreement (February 1942), had already compromised the sterling area (see US Department of State 1985: 2–4). Gardner (1956: 51–68) concludes that the elimination of Imperial Preference was linked to the promise of an open-handed Lend-Lease settlement, by which the USA helped the UK survive during the Second World War and afterwards. As Roosevelt declared, in a communication to his secretary of state in September 1944: 'The real nub of the situation is to keep Britain from going into complete bankruptcy at the end of the war … I just cannot go along with the idea of seeing the British empire collapse financially, and Germany at the same time building up a potential re-armament machine to make another war possible in twenty years' (US Department of State 1945: 145). Alongside this, the USA wanted to replace Britain at the center of the global economy. For US Treasury Secretary Morgenthau the establishment of an 'International Stabilization Fund' (as the early version of the IMF was called) would be the outcome of years of struggle to move the financial center of the world from the City of London to Wall Street and, in so doing, 'create a new concept for international financial dealings' (Van Dormael 1978: 241).

Expecting victory in the Second World War, Germany had developed the first post-war monetary plan. Walther Funk, minister of economic affairs and president of the German Reichsbank, outlined a plan for the reconstruction and reorganization of the German and European economies after the war. Goebbels's propaganda machine trumpeted the 'New Order' as a kind of multilateralism that would bring unprecedented prosperity to Europe. In reaction to the German plan, in April 1941 Keynes set down his Proposals for an International Clearing Union (Cmd. 6437, London, 7 April 1943), which eventually became the basis for official British economic policy. He envisioned the sterling area at the center of a monetary system that other countries would gradually join, with the USA not playing much of a role (Van Dormael 1978: 5–11). In the USA, after the attack on Pearl Harbor in 1941, Morgenthau asked White to outline an Inter-Allied Stabilization Fund (Block 1977: 43; Van Dormael 1978: 40).

The antecedents for this can be traced to an Inter-American Bank proposal submitted by Roosevelt to Congress in 1940 that Morgenthau and White helped prepare (Mikesell 1994: 2). White drafted two plans in 1942: a Proposal for a United Nations Stabilization Fund and a Bank for Reconstruction and Development of the United and Associated Nations, both contained in the Preliminary Draft Outline of a Proposal for an International Stabilization Fund of the United and Associated Nations published in Washington, 10 July 1943. White's plans were eventually the blueprints for what later emerged as the IMF and the IBRD. Formal discussions began in spring 1943, after White's International Stabilization Fund draft had been sent to a number of countries for consideration. The proposal was discussed at an informal conference held in Washington in June 1943, attended by representatives of nineteen countries. The discussion concerned alternative plans, proposals and memoranda. The French published a memorandum on currency stabilization on 9 May 1943 (Beckhart 1944), while Canada published Tentative Draft Proposals of Canadian Experts for an International Exchange Union in Ottawa, 9 June 1943 (Knorr 1948). The more realistic, less intricate, French suggestions were given little consideration in working out the mechanisms of a new economic order. The Canadian plan resembled the White plan, but contained elements of Keynes's ideas. Once negotiations started in earnest White's plan became the real basis for discussions.

Informal discussions between American and British officials had begun in 1942. The Americans continued bilateral discussions with the British and representatives of other countries during the summer of 1943. At the meeting on 22–23 June 1943 between the British and American representatives, plans were made for negotiating a Joint Statement on an International Monetary Fund to be presented at an international conference. Representatives from the USA and the UK met nine times in Washington between 15 September and 9 October 1943. Complete agreement on a Joint Statement of Experts on the Establishment of an International Monetary Fund was reached in April 1944. While not covering all issues concerning the IMF, and not dealing at all with the IBRD, 'it did provide a framework to take to Bretton Woods, on which the American, British, and Canadian delegations agreed, and which they largely imposed on other countries' (Mikesell 1994: 25). Leon Frasier of the US First National City Bank would say later of the Bretton Woods agreements: 'in the conditions of the world as it was at the time of those negotiations,

these fellows said, "sure why not?" They had nothing whatever to lose. They looked to us for their military salvation and for their economic salvation, and any proposal within human reason put forward by representatives of the United States would in the nature of things be acceptable' (Block 1977: 51).

The statement was released on 21 April 1944, a few months prior to the Bretton Woods conference, where it was to be discussed in detail (Beckhart 1944: 493). The IBRD was first proposed in November 1943 and presented only in 'blueprint stage' at Bretton Woods (Heilperin 1947: 38). Although the US drafts were supposedly open to suggestions, alternatives of a fundamental nature were not encouraged – 'the American Delegation from the outset was committed to a particular course of action' (Beckhart 1944: 494). While there were differences between the US and UK versions – in general the USA wanted a large, political organization (the IMF) staffed by permanent officials, while Keynes wanted a small, part-time organization where an economic and financial intelligentsia would come together – the plans rested on common grounds, and both agreed that the monetary chaos of the inter-war period had yielded valuable lessons about a situation that all were determined to avoid in the future. Together they easily prevailed over plans developed by other member nations.

Morgenthau and White invited representatives from Australia, Belgium, Brazil, Canada, Chile, Cuba, Czechoslovakia, the French National Committee of Liberation, India, Mexico, the Netherlands and the Philippines to join the four 'great powers' – the USA, the UK, China and the Soviet Union – in a pre-conference drafting session at the Claridge Hotel in Atlantic City in June 1944 (Eckes 1975: 121). The 1944 meeting set the agenda for the Bretton Woods conference (Mikesell 1994: 33). White intended the Atlantic City meeting as an exploration 'to ascertain the differences of opinion, the major issues troubling the various delegates, so as to provide a basis for discussion and determine the position to take on the various points' (Van Dormael 1978: 169). It became evident from this meeting that the issue of quotas (deposits with a coordinating international agency) was of considerable importance. Since the discussions of 1943, delegates had been asking how quotas would be determined. The system of subscriptions and quotas as proposed by the USA would be a fixed pool of national currencies and gold subscribed by each member country. In mid-April 1943, White asked Mikesell, an economist in the Division of Monetary Research in the US Treasury Department, and

later member of the technical secretariat at Bretton Woods, to prepare a formula for stabilization fund quotas based on members' gold and dollar holdings, national incomes and foreign trade (that is, their economic might). Members were assigned quotas roughly reflecting their relative economic importance (Cohen, S. 2000). Although the delegates were later informed that quotas were based on a 'scientific formula,' Mikesell explained that White:

> gave no instructions on the weights to be used, but I was to give the United States a quota of approximately $2.9 billion; the United Kingdom (including its colonies) about half of the US quota; the Soviet Union, an amount just under that of the United Kingdom; and China, somewhat less. He also wanted the total of quotas to be about $10 billion … our military allies … should have the largest quotas, with a ranking on which the president and the secretary of state had agreed. (Mikesell 1994: 22)

By comparison, the quotas in the 1943 version of the Keynes plan were as follows: the UK $4.98 billion; the USA $4.04 billion; France $1.93 billion; Germany $3.13 billion; the USSR $0.41 billion (Block 1977: 234). Quotas were deemed of great importance because voting power at what eventually became the IMF would be based on them, as the American delegation proposed. White did not want to negotiate the issue. From the beginning it was tacitly agreed that votes on decisions made at the IMF (and later the IBRD) would be proportional to members' quotas, and not on the more democratic one-country-one-vote system. Clearly, this system did not meet all countries' expectations, and it remained problematic even for many who accepted it. White (see Van Dormael 1978: 170) explained the positions of the different countries: all countries wanted larger quotas; the more troublesome countries were China, insisting on having fourth place; France and India, both insisting on having fifth place; and all the smaller countries, especially those of the Third World, wanting larger quotas than assigned. The most troublesome country was Australia, which was seen to be 'participating to an extent far beyond the proper role of a country of her size and importance.' With one-third of all the quotas at the outset, the USA assured itself an effective veto power over future decision-making (Cohen, S. 2000). (See Table 2.1.)

Both the White and the Keynes plans proposed some kind of 'international agency' that would control exchange rates (Scammell

Note: * The quota of Denmark to be determined by the Bank after Denmark accepts membership in accordance with the Articles of Agreement

Source: USA Department of State, 'International Monetary Fund Final Act Text', in *Proceedings and Documents of the United Nations Monetary and Financial Conference, Bretton Woods, New Hampshire. July 1–22, 1944*, vol. II, Washington, DC: US Government Printing Office, 1948, p. 1477

1980). Both plans reacted to two preceding extremes: the rigidity of exchange rates of the 1920s; and the floating rates of the free-for-all regime of the Depression years. For the Bretton Woods planners, the problem with the inter-war period had been lack of management and 'collective responsibility,' and the absence of a regulatory mechanism. Another important function to be performed by the international agency involved overseeing a 'code of action' and providing an 'institutional forum for cooperation and consultation,' with member governments formally committing themselves to collective respon-

sibility for the management of the international monetary order, unlike the divided responsibility and anarchy of the 1930s (Cohen, B. J. 1991). The international agency was conceived in this way so as to have 'supervisory power' concerning national actions threatening international equilibrium (Scammell 1980). In other words, the agency 'polices the responsibility of each nation to the community of nations' (Cooper 1975: 85). The policing function of the agency was greeted by Soviet hostility, and eventual refusal to ratify the agreements made at the conference – accepting the IMF would mean 'exacting investigations' of Soviet gold production, gold and foreign exchange holdings, spending of borrowed funds, and so on – all of which the USSR 'customarily kept secret' (Knorr 1948: 35). A 'code of action' was supposed to prevent the sort of economic warfare seen in the 1930s by providing a mechanism of multilateral clearing (Cohen, B. J. 1991; Scammell 1980) – by which was meant the supplementation of national stocks of currencies and gold, according to the system of quotas, to ensure an adequate reserve supply, with prearranged borrowing facilities (Cohen, B. J. 1991). According to Mikesell (1994: 12) both plans provided 'for international liquidity to enable countries to stabilize their currencies, eliminating exchange restrictions on current transactions, and outlawing bilateral payments arrangements and other forms of discrimination.' The several subsequent versions of White's plans were centered on reconstruction in the immediate post-war period, and balance-of-payments problems, while Keynes's Clearing Union, on the other hand, was concerned more with the multilateral clearing of national balances, and the debiting and crediting of net balances (ibid.: 5–13).

While the foreign delegations were getting acquainted with Bretton Woods, Morgenthau and White set to work. No matter what the intentions of the other governments were, the Americans had a clear idea of what they wanted to result from the conference. The US position was announced publicly in a press release on the first day of the event:

> The purpose of the Conference is … wholly within the American tradition, and completely outside political consideration. The United States wants, after this war, full utilization of its industries, its factories and its farms; full and steady employment for its citizens, particularly its ex-servicemen; and full prosperity and peace. It can have them only in a world with a vigorous trade. But it can have

> such trade only if currencies are stable, if money keeps its value, and if people can buy and sell with the certainty that the money they receive on the due date will have the value contracted for – hence the first proposal, the Stabilization Fund. With values secured and held stable, it is next desirable to promote world-wide reconstruction, revive normal trade, and make funds available for sound enterprises, all of which will in turn call for American products, hence the second proposal for the Bank for Reconstruction and Development. (US Department of State 1948: 1148)

As planned by White, the Bretton Woods conference was conducted through the means of three commissions: Commission I (International Monetary Fund), of which White was chairman; Commission II (Bank for Reconstruction and Development), chaired by Keynes; and Commission III (Other Means of International Financial Cooperation), chaired by Eduardo Suarez of Mexico. Each commission had several committees with non-US chairs and reporters. Washington usually had the support of the Latin American delegates. In return, the US representatives assured them that they would be able to select two directors, for the IBRD and the IMF. Britain counted on the backing of the Netherlands and Greece, as well as the Commonwealth countries, on most issues (Eckes 1975: 154). For more than two weeks committees and commissions met, sometimes twice a day, reviewing proposals put before them, making suggestions, recommending changes and putting forward new proposals. As it was an advanced technical conference, power resided in the hands of experts – economic and technical specialists and lawyers. Specialist opinion prevailed 'except on several sensitive political issues, which the technicians referred to senior cabinet officials for final approval' (ibid.: 138).

White neutralized Keynes, the only person seriously able to upset his plans, by appointing him chairman of the Commission on the IBRD. That kept the British so busy that they were unable to interfere with committee meetings regarding the IMF (Van Dormael 1978: 157). At the same time, Commission I – dealing with the IMF – was handled by White himself to prevent, as he said, discussion occurring, and agreements being made, on matters with which the Americans did not concur (ibid.: 174). All secretaries of the committees and their assistants were Americans. They would select and propose the subjects to be discussed, count the votes and, above all, write the minutes of the meetings and draft the final Act. The delegates were

told in a memorandum that 'secretaries like other officers at the Conference, are on this occasion international officials and for all practical purposes temporarily lose not only their national identity but their allegiance to the organizations, governmental or otherwise, with which they are affiliated' (US Department of State 1948: 1148). But in fact they were people White had trained at Atlantic City, and they formed a homogeneous and cohesive team that could understand the main issues and defend the US position. As one commentator put it:

> whether the delegates were aware of it or not, the important decisions were made behind closed doors, between the American delegation and the foreign delegation involved. While Harry White and his small group of 'technical advisers' kept absolute control over the text of the articles to be included in the agreement, the powerhouse of the conference was in Morgenthau's office, where some of the most difficult and troublesome issues had to be settled. (Van Dormael 1978: 179)

Additionally, White developed a further mechanism to ensure that the conference was under his control. Even though 'delegates from other countries made numerous proposals that conflicted with the basic pre-conference positions and agenda' (Mikesell 1994: 34), Morgenthau wrote in his diary that White had said: 'When there was some disagreement at some point, instead of referring back to the committees, or instead of discussing it at any length in the committees, we let a few people discuss it, and immediately referred it to the ad hoc committees, created especially for that purpose, to refer back to the Fund Commission, and not to the committees' (ibid.: 200).

After two weeks of deliberations the articles of agreements resembled, in general, the framework proposed in the Anglo-American joint statement (Eckes 1975: 149).

The Bretton Woods model

The Bretton Woods institutions were supposed to govern agreed-upon principles for the conduct of economic affairs decided at the conference – as stated in Article I of the Agreement, the IMF's purpose was 'to facilitate the expansion and balanced growth of international trade and to contribute thereby to the promotion and maintenance of high levels of employment and real income and to the development of the productive resources of all members as

primary objectives of economic policy' (Scammell 1973: 119). These principles were as follows:

1 The experience of the competitive depreciation of currencies during the 1930s led to the principle of international control over exchange rates between national currencies. As the long-raging controversy between free and fixed exchange rates could not be resolved, a compromise was reached that can be termed 'managed flexibility.' Under this, the par values (see pp. 61, 76) of member-country currencies were defined in gold terms, but allowed to vary around these standards, with par values changed by more than this only under drastic conditions and by permission of the IMF.
2 A pool of gold and currencies to be drawn on in case of balance of payments difficulties was subscribed by member countries to the IMF according to a quota system adjusted every five years. The quota determined the country's drawing rights and also its vote in the institution. Countries could exchange specified amounts of their currencies for those of other counties under conditions supervised by the IMF.
3 To enable multilateral trade, after a five-year transition period, all member countries were to eliminate controls making currencies convertible into one another at the official rates without restrictions or discrimination unless approved by the IMF.
4 Various 'scarce currency' provisions were made to decrease instabilities resulting from shortages due to sustained surpluses in a country's balance of payments – the IMF was authorized to declare the scarcity, ration its remaining supply, require a country to sell currency to it, in exchange for gold, or use other measures.
5 The Bretton Woods Agreement established a permanent institution to promote international monetary cooperation and provide the machinery through which countries could consult and collaborate. The institution, called the IMF, a specialized agency of the UN, was part of an envisaged system that also included a bank dealing with long-term investments (IBRD), a trade organization (ITO), and actions to promote full employment under the UN Economic and Social Council. The IMF would have a board of governors, representing all member countries, which met annually, an executive board, of which five members would be from countries with the largest quotas, meeting continuously, and a managing director, who was not a board member. Voting on both boards was

to be according to quotas. Under the original quota system, the USA had 27.9 percent of the vote and the UK 13.3 percent (ibid.: ch. 5).

There was one issue, later to become highly controversial, which divided the Americans and the Europeans. The European view of the lending operations of the IMF was that resources would be provided to member countries more or less on request, as they were needed. In particular the British delegates to Bretton Woods thought that members should be free to pursue whatever domestic policies they desired, even if these affected exchange rates, a central concern of the conference. By contrast, the Americans thought that borrowing foreign currency (dollars, as it turned out) from the IMF was not an unqualified right. At the Atlantic City pre-conference the US delegation proposed that the language of the proposed Articles of Agreement (Article V) be changed from a 'member *shall be entitled* to buy another member's currency from the Fund' to a 'member *may* buy the currency of another member from the Fund' (emphasis added). The United Kingdom had the support of virtually all other countries in successfully opposing this change. While this indicates, however, that the USA did not entirely have its own way at Bretton Woods, subsequent practice at the IMF indicates otherwise. The US executive director on the IMF executive board, Frank Southard, insisted (in a memo) that use of Fund resources should be subject to close scrutiny to assure a country's adherence to its principles and purposes. Indeed, the US executive director challenged several requests to draw on IMF funds in the late 1940s on these grounds and, as a result, little use was made even of the gold that countries had deposited, until in 1950 the managing director specified that countries would have to lay out the specific steps they would take in overcoming balance of payments difficulties. Britain and France abstained in the subsequent vote on this issue, while other countries agreed to the American notion of 'conditionality' only because the USA was the main source of credit (Harmon 1997: 23–4).

Ratification

Following the conference, delegates were to explain the Bretton Woods agreements to their respective governments. In many cases, the delegates did not know exactly what they had signed, nor did their governments. Van Dormael (1978: 286) illustrates this point:

> Driven through the US Congress by what was described in the *New York Herald-Tribune* as 'the most high powered propaganda campaign in the history of the country,' and reluctantly agreed to by the British Parliament because they were tied to an indispensable loan, in most other member countries the Bretton Wood Agreements had been ratified without debate or opposition. Parliaments had hardly, or not at all, been involved in the negotiations, and did not know what they were all about. In most cases, it was a simple formality.

In the USA, opposition to ratifying the agreements came mainly from bankers, prominent newspapers and influential Republicans. Block (1977: 54) attributes 'the failure of the powerful international bankers to block outright Congressional approval' to two factors: first, the Fund would be a symbol of America's good intentions and a look forward to a rationally ordered international economy; second, a large economic quota guaranteed the USA effective veto power at the Fund. After Bretton Woods, Keynes wrote in a memorandum to the UK Chancellor of the Exchequer, 'We cannot be expected to sign an instrument which is either self contradictory or hopelessly obscure' (Van Dormael 1978: 226). In order to get the UK to ratify the agreements, on 13 November 1945 the new US Treasury secretary, Fred Vinson, whom President Harry S Truman had appointed to replace Morganthau after Roosevelt died, reiterated that the granting of a credit to the UK was dependent on its agreeing to the Bretton Woods accords. Vinson said that 'it had been made clear to the British that they would have to ratify Bretton Woods before the credit proposal was put up to Congress' (ibid.: 274). The Anglo-American Financial Agreement for a US$3,750 million loan was finally signed on 6 December 1945. 'Detailed terms of the loan were listed and one of the conditions was the ratification of Bretton Woods. In addition, Britain committed itself, unless the United States agreed to a temporary extension, to remove within a year all restrictions on the convertibility of sterling for current transactions' (ibid.: 275). After the agreements had been signed, and made public in London, Keynes became involved in a controversy over whether the Bretton Woods agreement was in the interests of the British Empire. The controversy over interpreting the agreement was not limited to economists and financial writers in the press. Within the UK Treasury, there was disagreement between Keynes and Professor Dennis Robertson over the meaning of certain provisions in the Final Act. Robertson was the

British delegate on Commission I, dealing with the IMF. At Bretton Woods, without consulting Keynes, Robertson had suggested that the words 'gold and gold-convertible currency' be replaced by 'net official holdings of gold and U.S. dollars.' White referred the matter to a special committee, not permitting further discussion. The special committee was the group of technicians headed by White. 'The change from "gold" to "gold and U.S. dollars" was lost in the ninety-six pages the chairmen and delegations signed a few days later' (ibid.: 170–71, 202). But it would legitimize the par value or dollar-pegged system that would come to characterize the Bretton Woods era.

In January 1946 the USA invited the thirty-four nations that had, by then, ratified the agreement to attend the inaugural meeting of the board of governors of the IMF and the IBRD in Savannah, Georgia. In Savannah it was decided that the offices of the IMF and IBRD were to be located in Washington, DC, because it would be easier to get economic information from the countries through their embassies. Keynes proposed New York, center of the capital market, as an alternative, to avoid excessive US political influence. The resulting decision, against Keynes, was possible owing to the US vote, combined with client regimes in Latin America and elsewhere. Keynes also wanted White to become first director of the IMF in order to ensure expansionist economic policies. But to ensure Wall Street confidence, he was left out (Block 1977: 74–5).

Political decolonization, economic recolonization

Post-war decolonization involved, in part, a movement for the redistribution of global economic power away from its exclusively Western, capitalist bases. In the 1950s and 1960s, Third World countries, motivated by structuralist theories of development (i.e. theories that looked to the specific socio-economic structures of Third World societies and to relations with First World countries for the causes of their underdevelopment), contended for power. Raul Prebisch, an Argentine economist based originally in the UN Economic Commission for Latin America (ECLA), but later the first secretary-general of UNCTAD (UN Conference on Trade and Development) after its founding in 1964, proposed a program of economic reform that would benefit Third World countries: this included commodity price stabilization, preferential tariffs and the expansion of foreign assistance. Gradually structuralist views came to prevail in many UN agencies and were the dominant view of the majority in the

UN General Assembly, where the principle of one-country-one-vote prevails, and where the world's people meet in the closest thing to a global democratic assembly that presently exists. The outcome was supposed to be a special UN Fund for Economic Development (SUNFED), in which the criteria for loans would be development need rather than banking rules. Opposed to this movement, First World governments resisted by backing the IMF and the World Bank, where voting is according to capital subscription. One such response was to set up the International Development Association attached to the Bank as its main 'soft loan window.' Along with creating a chronically underfunded UN agency (UNDP, the UN Development Program), this derailed the Third World governments' demand for a global development institution that they, representing most of the world's peoples, might control. Third World efforts at achieving economic reform continued in UNCTAD and through the call for a New International Economic Order. These efforts were increasingly resisted by the USA, with ideas particularly coming from the Heritage Foundation, a right-wing Washington think tank. The Reagan administration came to power with a mandate not only to roll back communism, but also, at the same opportune moment, to discipline the Third World, including the state-assisted capitalist countries of South-East Asia. This was accomplished through stabilization loans, structural adjustment and neoliberal reform programs pushed by the World Bank and the IMF in the 1980s and 1990s. The US response to the East Asian crisis of 1997 should be understood not as helping economic recovery, but as an attempt at resubordination. Additionally, the pro-Third World agency UNCTAD was effectively replaced by the WTO, founded in 1994. The world is now governed by Western-controlled institutions, by the G7 and G8, led by the USA, together with the IMF, the World Bank, WTO and OECD. The US position is that the existing global capitalist system is basically sound and that significant reform is unnecessary. And that position is backed by ferocious military, economic and cultural power. In effect, we might add after September 11, 2001, the world was made safe for Americans … by making the world American (Bello 2003).

Formalizing dominance

This chapter has presented my version of what transpired during those hot summer days in the now distant year of 1944. The chapter has conducted a detailed examination of the conditions, arguments,

preparations and maneuvers connected with the Bretton Woods Conference of 1944, which resulted in the establishment of the IMF and the IBRD. My position has been that Bretton Woods was an occasion for the formalization of US and UK dominance into an international monetary agreement, complete with enforcing institutions. In the period 1945–59, the IMF, the central institution formed at Bretton Woods, sat in abeyance awaiting the widespread establishment of the free convertibility of currencies and other conditions that it was designed to operate under. The Fund played only a minor role in establishing these conditions. In 1959 widespread currency convertibility enabled the IMF to begin to play the role White and Keynes had envisaged. And this role, especially from the 1970s onward, involved the IMF in surveillance of national economic policies and disciplinary controls over them. Yet, as I have shown, the IMF was not formed as a democratic institution in anything like the sense of inter-country equality. It was primarily an American invention, with British collaboration, consciously designed to foster one particular perspective on the development of global economic relations. It was located in Washington to place it within a policy-making system dominated by the US Treasury. The voting system was deliberately designed to enable the US will to prevail, and to prevent policies not in the US national interest from being adopted, or perhaps even discussed. From the beginning an expert-led discourse prevailed which ensured the domination of the Western economic intellect, to the point that many 'member countries' had little idea what they were accepting when they ratified the Bretton Woods Articles of Agreement. Although Bretton Woods resulted from American and British planning and cooperation, the USA dominated the conference and directed it according to its national interests. The USA emerged from Bretton Woods as an unchallenged hegemonic world power. A world economy centered on the USA came to dominate the quarter-century that followed (Hobsbawm 1994). The Bretton Woods regime became synonymous with a hegemonic monetary order centered on the dollar (Cohen, B. J. 1991: 243). Yet rather than being revealed for what it was, US domination could be clothed in the raiment of 'international consultation and collaboration' because of the apparently international nature of the conference. Thus the considerable abilities of the Bretton Woods institutions to direct and control the global economy that developed over the next half-century were, to a great degree, extensions of American political-economic power.

In all this, there is lots of evidence of conspiratorial collusion, tempered by occasional collision, particularly between the USA and the UK, but more generally among the 'great powers,' as they were too honestly called at the time. And there are many instances too of the interventionist abilities of 'great personalities,' again embraced in a dialectic of collision and collusion. Conspiratorial theories of why things happen are, however, fat with facts but thin on thoughts or, rather, rest on weak notions of power. They do not see that conspiring men represent interests by employing persuasive ideas, which sometimes they have helped to form, as with Keynes, but often they have merely updated to or specified a changed context. 'Great men' are effective agents in the construction of hegemony only when they marshal great ideas or, more skeptically, ideas that seem as though they might work to resolve crises. The system of concepts enables the statements they make to have logical order, explanatory depth and persuasive power. Suspecting this, I previously outlined the notion of discourse as a set of statements backed by validation procedures that lend them, in a scientifically modern world, the persuasive effect of the truth. And I accepted from the international relations literature the notion of regime as a system of social institutions that unify national behaviors and legitimize their policies as contributing to global order. Recalling these notions, I suggest that the Bretton Woods regime was constructed through the intersection of two economic discourses: the discourse of classical, liberal economics, modernized by mathematical neoclassical economics, and geopolitically extended in an age of world wars through a connection between trade and peace; and the discourse of twentieth-century, New Deal liberal or social democratic, Keynesian economics responding to 'market failure' by advocating state intervention. Further, I posit that classical liberalism was the primary discourse underlying an articulation with a secondary Keynesianism that was only reluctantly accepted in the USA and, as I suggested in Chapter 1, virtually abandoned for neoliberalism in the 1970s. That is, the international economy was seen as a regime best organized by competition, trade and markets in the classical and neoclassical economic senses, with regulatory intervention by an IMF and a World Bank kept under US control. Further, I suggest that this intersection of discourses resulted in a strange kind of cross-breed regime in which global governance institutions, invented to regulate the conditions of economic interchange, would call for deregulating economies. And finally, while I find the notions of discourse and regime insightful,

helping to organize a comprehension that has depth and cohesion, I also find both lacking in much the same area – the ideas that discourses convey and the concepts mobilized by institutional regimes. The underlying ideas, thought in the interest of power, give cohesion and appeal to discourse and regime.

THREE
The International Monetary Fund

As originally conceived at Bretton Woods, the IMF was to be a supranational body essentially doing two things: it would regulate the rates at which currencies were exchanged among member countries; and it would help ensure international stability by making loans at times of crisis in member countries' balances of payments. While its mission statement remains essentially the same, the IMF has subsequently undergone major changes, including several apparent reversals of fortune, that nevertheless resulted in an overall accumulation of power and influence – although recently that accumulative trend seems finally to have reversed. Today IMF policies directly affect the economies of 185 countries and influence, sometimes drastically and often disastrously, the lives of the vast majority of the world's people. Until recently the IMF was probably the single most powerful non-state (governance) institution in the world. Publicly, governments had to praise the IMF, while complaining privately about the policies imposed on them. By contrast, thousands of workers and students demonstrate against the IMF, in many cases losing their lives in the process because, they say, its economic policies produce poverty, hardship and starvation.

Why do large numbers of people protest the granting of IMF loans intended to stabilize economies in times of trouble? The IMF gives short-term loans to member countries experiencing balance of payments crises, essentially from previously deposited funds, but with the essential difference that the loans are made in 'harder' (more internationally acceptable) currencies than the deposits. Originally, under the Bretton Woods agreement, the conditions for IMF loans to member countries required simply 'an effective program for establishing or keeping the stability of the currency of the member country at a realistic exchange rate' (IMF 1958: 404). Over fifty years this limited 'conditionality' has grown into something far more. Loan conditionality, imposed on what are usually desperate governments, has become a way for the IMF to regulate the entire gamut of a country's economic policies. So it is not the actual deliverance of the loan but its

conditionality which is contested. Governments are required to adopt a set of economic policies and prescribed financial measures based on what the IMF thinks will promote economic stability, increasing the government's capacity to service loans – that is, make interest and loan repayments. By what theoretical means does the IMF establish these policies? The institution appeals to the best of neoclassical economic science backed now by fifty years of experience in the loan business. But a critical examination of that experience suggests instead that it extracts repayment at the expense of the economy, and especially on the backs of the poor people, of the borrowing country. And a critical look at its economics, especially after the mid-1970s, suggests that the IMF adheres to a neoliberal version of neoclassicism, one that so well knows what economies really need that it automatically generates the same policy package no matter what the context. The policies suggested by the IMF almost always require reducing tariff barriers on imports, and this eliminates jobs. They increase interest rates to cool the economy and reduce inflation, and this too reduces employment. At the same time, they impose austerity programs that cut back government services and remove state subsidies that have kept food prices low. So, critics argue, IMF policies create unemployment and poverty while reducing the national state's power to remedy the resulting social problems. Immediately, people who can least afford it are made to pay for loans to governments whose previous policies are deemed mistaken by IMF economists. More than this, the IMF imposes its own economic beliefs on countries that might wish to develop differently. IMF loans then become a point of tension at which social struggles within a society articulate with tensions between the society and the global system, with two main institutions – the national state and the IMF – at the center of the controversy. Most basically, then, the IMF extracts conditions that favor repayment at the expense of poor and working people. Whose interest, therefore, does the IMF economic discourse serve? I will try to provide an answer in this and the following chapter. But first we have to know the IMF inside out.

Structure of the IMF

Established in 1945, when twenty-nine governments signed articles of agreement resulting from the 1944 Bretton Woods conference, the IMF actually began operations in 1947. The IMF was supposed to be the primary supranational institution that regulated the financial

conditions deemed appropriate for the successful functioning of the world economy – especially, in its early days, conditions relating to currencies and exchange rates. These financial conditions were understood within a classically liberal capitalist view of how economies should function. Necessarily, Keynesian notions were added to this classical and neoclassical base – that some markets needed regulating by quasi-state institutions to ensure proper and fair functioning – 'necessarily' because the IMF itself is such a regulatory institution. As stated in Article I of the original Articles of Agreement (IMF 1990), the objectives of the IMF were:

1 To promote international monetary cooperation through a permanent institution which provides the machinery for consultation and collaboration on international monetary problems.
2 To facilitate the expansion and balanced growth of international trade, and to contribute thereby to high levels of employment and real income and to the development of the productive resources of all members as primary objectives of economic policy.
3 To promote exchange stability, to maintain orderly exchange arrangements among members, and to avoid competitive exchange depreciation.
4 To assist in the establishment of a multilateral system of payments in respect of current transactions between members and in the elimination of foreign exchange restrictions which hamper the growth of world trade.
5 To give confidence to member governments by making the general resources of the Fund temporarily available to them under adequate safeguards, thus providing them with opportunity to correct maladjustment in their balance of payments without resorting to measures destructive of national or international prosperity.
6 In accordance with the above, to shorten the duration and lessen the degree of disequilibrium in the international balances of payments of members.

Theoretically the IMF is situated within the United Nations system. It is the central institution of the international monetary system, the system of international payments and exchange rates among national currencies, which prevents crises in the payments system. It does so by monitoring the economic policies of member countries and acting as a reserve fund that can be used by members needing temporary financing to address balance of payments problems. The

IMF focuses mainly on the macroeconomic policies of governments, including: policies relating to the state budget, the management of money and credit, and the exchange rate; and the financial policies of governments, including the regulation and supervision of banks and other financial institutions. In addition, the IMF looks at the structural policies that affect macroeconomic performance (that is, the performance of economic aggregates such as national income, total national consumption, investment and the money supply). Under Article IV of the Articles of Agreement each member country commits itself to: directing its economic and financial policies toward orderly economic growth with reasonable price stability; promoting stability by fostering orderly underlying economic and financial conditions and a monetary system that does not produce erratic disruptions; avoiding manipulating exchange rates or the international monetary system in order to prevent effective balance of payments adjustment or to gain an unfair competitive advantage over other members; and following exchange policies compatible with these undertakings.

The Board of Governors, with representatives appointed by all member countries (usually a country's minister of finance or the governor of its central bank), is the highest authority governing the IMF. The Board of Governors meets twice a year at the joint annual meetings of the IMF and the World Bank to make decisions on major policy issues.

The Board delegates immediate, day-to-day decision-making to an Executive Board of twenty-four executive directors, with a managing director as chairman. The IMF staff and management are accountable to the IMF's managing director, who is appointed by and accountable to the Executive Board. By 'gentleman's agreement,' the managing director is chosen by the IMF's European member governments, while the first deputy managing director is chosen by the US government. The Executive Board selects the managing director, who, besides serving as chairman of the Board, is chief of the IMF staff, and conducts the business of the IMF under the direction of the Executive Board. Appointed for a renewable five-year term, the managing director is assisted by a first deputy managing director and two other deputy managing directors.

The Executive Board usually meets three times a week at the IMF headquarters in Washington, DC. The IMF's five major shareholders – the USA, Japan, Germany, France and the UK – along with China, Russia and Saudi Arabia, have their own seats on the Board. The other

sixteen executive directors are elected for two-year terms by groups of countries called constituencies. Member votes and representation are skewed in favor of creditor nations. A new formula for calculating voting weights can be considered only during periodic reviews of the 'quotas' assigned to each country. Ten of the available twenty-four Board seats are currently occupied by developing countries, collectively holding 26 percent of the voting share. For developing countries to carry a decision in their favor they must build alliances with creditor members. There are currently forty-five sub-Saharan African member countries in the IMF, which hold a combined voting share of 4.4 percent.

Documents for the Board's deliberations are prepared by the IMF staff, sometimes in collaboration with the World Bank staff, and are presented to the Board with management approval; some documents are also presented by executive directors themselves. Most decisions are made by consensus. Optimally this is a unanimous decision by all executive directors. But there are important differences of view among the membership, for example between debtor and creditor interest. The IMF's regulations prescribe that 'the chair shall ordinarily ascertain the sense of the meeting, in lieu of a formal vote,' effectively seeking the broadest spectrum of support in terms of numbers of executive directors and voting share, provided that if put to a vote there would be the needed majority (depending on the decision being made, a majority of 51, 66 or 85 percent is required). The chair urges the Board to consider matters at least until a broad majority has emerged on the issue under discussion. Where no consensus can be reached a simple majority of the voting power can quickly be achieved by a collective agreement among the directors from the main creditor countries.

Until recently, the organization had some 2,800 employees recruited from 133 countries. These are international civil servants whose responsibility is to the IMF, and not to their national authorities. About two-thirds of the professional staff are economists. The IMF's twenty-two departments and offices are headed by directors, who report to the managing director. Most staff work in Washington, although some eighty resident representatives are posted in member countries, where they advise governments (through the central banks and the ministries of finance) on economic policy. The IMF also has offices in Paris and Tokyo for liaison with other international and regional institutions and in New York and Geneva, mainly for liaison with

other institutions in the UN system. Key policy issues relating to the international monetary system are considered twice yearly in a committee of governors called the International Monetary and Financial Committee, or IMFC (until 1999 known as the Interim Committee). A joint committee of the Boards of Governors of the IMF and World Bank called the Development Committee also reports to the governors on matters of concern to developing countries (IMF 1998a).

The IMF's financial resources come mainly from the capital subscriptions that countries pay when they join the organization or, following periodic reviews, when quotas are increased. Countries pay 25 percent of their quotas in 'hard' or readily convertible currencies, such as US dollars or Japanese yen (originally these payments were in gold), and the rest in their national currencies. Quotas determine a country's subscriptions, its voting power, and the amount of financing it can receive from the Fund. Quotas reflect the size of a country's economy and its volume of trade. The USA contributes most to the IMF and has 17 percent of the total votes; Japan and Germany both have about 6 percent of the votes; France and the United Kingdom each have 5 percent; Saudi Arabia, China and Russia have approximately 3 percent each. Since January 1999, IMF quotas have totaled $290 billion (or SDR212 billion – the SDR, or special drawing right, is an international reserve asset introduced by the IMF in 1969, whose value is based on a group of leading world currencies). The IMF can also borrow further under two sets of standing arrangements: the General Arrangements to Borrow (GAB), set up in 1962, with eleven participants (the governments or central banks of the Group of Ten industrialized countries and Switzerland); and the New Arrangements to Borrow (NAB), introduced in 1997, with twenty-five participating countries and their financial institutions. Under the two arrangements combined, the IMF has a further $46 billion (SDR 34 billion) available for emergencies (IMF 2002a).

Countries usually approach the IMF for financing when they are experiencing balance of payments problems – that is, not taking in enough foreign exchange (especially hard currency) from exports, or foreign investments, to pay for imports. This emergency situation, important because some imports are vital for economies or social services to function, is usually accompanied by other signs of economic crisis, as when the national currency is under attack in foreign exchange markets, the country's reserves of gold or hard currencies are heavily depleted, or the economy is suddenly depressed. Member

countries can immediately and unconditionally draw on the 25 percent of their quota (called a 'tranche' or portion) originally deposited in hard currency or gold. Should this be insufficient, they can then draw up to three times their original quotas (in hard currencies) as 'upper tranche' loans under conditions specified by the Executive Board of the IMF or, more exactly, by the IMF staff, as reported to the Executive Board. These conditions (or 'conditionalities') consist of policies that a government has to put into effect to convince the IMF that it will be able to repay the loan within a time span of one to five years. The Fund's power to impose conditionality originates from Article V ('Operations and Transactions of the Fund'), Section 3 of the Fund's Articles of Agreement, which broadly present the conditions governing use of the Fund's resources. Briefly, Section 3(a) states that the Fund: 'shall adopt policies on the use of its general resources […] and may adopt special policies for special balance of payments problems, that will assist members to solve their balance of payments problems in a manner consistent with the provisions of this Agreement and that will establish adequate safeguards for the temporary use of the general resources of the Fund.' This means that, prior to the release of any financial resources to its members, the Fund requires that certain constraints, widely known as 'conditionalities,' are imposed in the form of compliance with both Fund rules and Fund-suggested (practically mandated, in the case of poor countries) policy guidelines and adjustments. These 'monitoring techniques' provide the framework with which the Fund ensures solvency safeguards while targeting temporary balance of payments problems. There has been a significant increase in the number of conditionalities set for low-income countries eligible for its Poverty Reduction Growth Facility (PRGF) program. This increase in prescriptions has greatly expanded the IMF's remit to include public sector employment, privatization, public enterprise reforms, trade policy, pricing, social security systems and 'systemic' reforms, among others. This greatly enlarged scope of Fund conditionality advocates 'policies aiming more generally at improvements on the economy's underlying structure – its efficiency and flexibility – to foster growth, and facilitate adjustment to exogenous shocks.' This is where the Fund arrogates to itself the right to engage in much broader reforms including trade liberalization, pricing and marketing, labor market reorganization and generic institutional or regulatory changes. In a review of the legality of these extensions, Saner and Guilherme (2007) argue that

'it appears doubtful that lending arrangements with IMF member countries have complied with existing Fund rules.'

Details of the borrowing country's policy program are spelled out in a 'letter of intent' signed by a senior member of the government concerned and the managing director of the IMF. The IMF then monitors the government's performance to ensure compliance with the agreement specified in the letter of intent until the loan is repaid or renegotiated.

The IMF currently provides loans under a variety of 'arrangements' and 'facilities':

- *Stand-by Arrangements* assure member countries that they can draw up to a specified amount, usually over twelve to eighteen months, to deal with short-term balance of payments problems.
- *The Extended Fund Facility* provides assurance that member countries can draw up to a specified amount, usually over three to four years, to make structural economic changes that the IMF thinks will improve balance of payments.
- *The Poverty Reduction and Growth Facility* (replacing the Enhanced Structural Adjustment Facility in 1999) provides low-interest loans to the lowest-income member countries facing protracted balance of payments problems, with the cost to borrowers subsidized by funds raised through past sales of IMF-owned gold, together with loans and grants from richer member countries.
- *The Supplemental Reserve Facility* provides additional short-term loans at higher interest rates to member countries experiencing exceptional balance of payments difficulties because of sudden loss of market confidence reflected in capital outflows.
- *Contingent Credit Lines* provide precautionary IMF financing on a short-term basis when countries are faced by a sudden loss of market confidence because of contagion from difficulties in other countries.
- *Emergency Assistance* helps countries coping with balance of payments problems arising from sudden and unforeseeable natural disasters or, since 1995, emergency conditions stemming from military conflicts (IMF 2002b).

At present, all IMF borrowers are developing countries, transitional post-communist countries or 'emerging market' (middle-income) countries recovering from financial crises – although the middle-income countries have recently become extremely reluctant to borrow from

the Fund. Since the late 1970s, all the developed-country members have used private or other capital markets for loans, but in the first two decades of the IMF's existence over half the financing went to these countries. The IMF does not consider itself to be an aid agency or a development bank. It deals only with governments – the foreign exchange loaned by the IMF is deposited with the country's central bank to supplement its international reserves. And the IMF expects borrowers to give priority to repaying its loans on schedule, with the institution using various procedures to deter the build-up of arrears, or overdue repayments and interest charges. Countries that borrow from the IMF's regular, non-concessional lending facilities (that is, all but the low-income countries) pay market-related interest rates and service charges, plus a refundable commitment fee. In most cases, the IMF provides only a small portion of a country's external financing requirements. IMF approval signals to other financial institutions that a country's economic policies are on the 'right track,' reassuring investors and officials, and helping generate additional loans from these sources – the IMF, in other words, is the bankers' guide to creditworthiness. The IMF examines the economic policies of member countries through a process known as surveillance. Once a year, the IMF appraises members' exchange rate policies within the overall framework of their economic policies in what is known as an 'Article IV consultation.' (Article IV of the Articles of Agreement originally gave the IMF the power to oversee the international monetary system in order to ensure its effective operation, to oversee the compliance of each member with its obligations to the IMF, and the right to exercise surveillance over the exchange rate policies of members, including consultations, while respecting the domestic social and political policies of members, and paying due regard to the circumstances of members.) Surveillance is based on the IMF's conviction that certain approved domestic economic policies will lead to stable exchange rates and a growing and prosperous world economy (IMF 1998a).

IMF policy 1945–71

The IMF was formed mainly to address the economic needs of the European and North American nation-states in the immediate post-war period. These problems were thought to centre on exchange rates and balances of payments. To clarify: the term 'exchange rate' refers to the price of one currency in terms of others. In market

systems, exchange rates vary with fluctuations in the demand for and supply of a country's currency. These, in turn, depend basically on demand for and supply of the country's goods and services – although currency speculation also plays an increasingly important role. The term 'balance of payments' refers to the total financial transactions between the residents of one country and residents of the countries of the rest of the world. Balance of payments accounts are kept by governments and are divided into a current account – recording payments for goods and services – and a capital account – recording flows of capital assets such as cash, stock market securities and government and corporate bonds. Countries have to maintain reserves of gold and hard currencies acceptable in global trading relations to cover a sudden shortfall in export earnings or dramatic changes in the market value of their currency, otherwise they would not be able to pay for necessary imports. Such reserves normally cover at least several months' worth of imports. Reserves covering only a few weeks' worth of imports signal a balance of payments crisis. In such cases, to prevent disruptions in trade, or to forestall drastic measures such as debt repudiation, deficits in a country's balance of payments can be temporarily filled by international credits, such as drawing from previous deposits with the IMF, or short-term loans from foreign banks.

In the longer term, a country's exports, and thus its foreign exchange earnings, can be increased by devaluing the national currency in terms of other currencies. Devaluation immediately makes exports cheaper and more internationally competitive. But it also makes imports more expensive, and as these higher-priced goods feed through the national economy, inflation eventually results. A further round of devaluations may then be necessary. This is exactly the kind of devaluation cycle that the IMF is supposed to prevent. In international economics a stable currency regime (that is, small variations in the rate at which a currency exchanges with others) is deemed important for reasons of trade and investment security (that is, maintaining the value of capital investments). By joining the IMF in the post-war years individual countries surrendered some of their sovereign economic rights, especially over how they set their exchange rates, in return for collective conditions of 'exchange stability, orderly exchange arrangements, the avoidance of competitive exchange depreciation, and a liberal regime of international payments' (de Vries 1986: 15). Essentially the original conception behind the IMF, resulting from the

experience of the Depression of the 1930s, was that member countries would adhere to certain standards of behavior spelled out in a code that was administered by an international institution.

Through the IMF, member countries originally agreed to fix their exchange rates in a system of 'par values.' Each member country determined a value for its currency, measured in relation to gold, a commodity used to represent value in general, which was permanently valued at $35 an ounce. The country had to intervene (through its central bank buying and selling currency) if international market conditions changed exchange rates by more than 1 percent of the original, agreed-upon, par value. In the case of 'fundamental disequilibrium' in a country's balance of payments (that is, large and continuing deficits), the country could propose changes in the par value of its currency to the IMF, which could approve, deny use of its resources or, in extreme cases, require a country to withdraw from membership, all this being aimed primarily at competitive depreciation. Under Article VIII of the original Articles of Agreement, the IMF could (after a transitional period that ended up lasting until the late 1950s) exercise 'surveillance' over a country's exchange conditions, as with countries imposing restrictions on international payments, or preventing the free convertibility of its currency into others. National currency controls could, however, be imposed in cases of emergency, as with wholesale capital flight, with the approval of the IMF.

For the first twenty years, the most controversial issue confronting the IMF was the use of multiple exchange rates, particularly by Latin American countries, and later by other Third World nations. 'Multiple exchange rates' means the use (by a country's central bank) of several different exchange values, depending on the purpose of an international payment – for example, more favorable exchange rates granted to industries endorsed by a country's development policy. Following a 1947 'Letter on Multiple Currency Practices,' member countries had to submit multiple exchange rate proposals for the IMF to consider on a case-by-case basis. The IMF would agree to multiple exchange rates on a temporary basis provided that member countries dealt with what the institution saw as the underlying economic conditions – this was the beginning of 'conditionality.' Always opposed to multiple rates, in the late 1950s the IMF intensified efforts at simplifying and then eliminating them by the early 1960s. At the same time the IMF tried to get member countries to remove restrictions on the convertibility of their currencies into other currencies as a way of smoothing out

the financial conditions for international trade and investment. By the early 1960s fully convertible currency regimes existed in many European members of the IMF (de Vries 1986).

The other main function of the IMF was to act as a revolving fund, initially of $9 billion, whereby a country facing balance of payments problems could purchase foreign currency with its own, to correct temporary deficits in its balance of payments – the amount exchanged had to be repaid in gold or a currency acceptable to the IMF, usually within a year. Initially this function of the IMF was little used, mainly because the issue of the conditions placed on purchases had not been resolved (see Chapter 2). Only after 1950, with a reluctant general acceptance of the US position that purchases (often of US dollars deposited with the IMF) were conditional on a country's statement of the steps it would take to resolve its problems, did this part of the mandate of the IMF come into full use. In 1952 the IMF Executive Board agreed to a statement by the managing director that the policies proposed by a country to overcome balance of payments problems would, above all, determine the IMF's attitude toward its loan request (Horsefield et al. 1969: 3, 228–30).

The IMF began to distinguish among the various levels of borrowing, with low conditionality applied to borrowing from the 'gold tranche' (that is, the gold previously deposited by a country with the IMF) and higher degrees of conditionality applied to the 'upper credit tranches' (that is, the foreign currency, often US dollars, bought by a country). With this, loan conditionality became institutionalized in IMF dealings with member countries, especially as Third World countries began to regularly request drawings in the 1950s after the Korean War boom in raw materials prices collapsed, and balance of payments crises began. The IMF made stand-by arrangements conditional on the acceptance of policies such as eliminating exchange controls and the 'liberalization' of trade conditions – which meant withdrawing state intervention in foreign trade relations in favor of market control. Also the practice of 'phasing' drawings of funds was introduced with loans to Chile in 1956 and Haiti in 1958. Each phase was made conditional on satisfactory performance by the borrowing country as judged by the IMF – these conditions being laid out in letters of intent starting in 1958. Conditionality was essentially a US conception for the operation of the IMF that was opposed by other member countries, who still took the position of 'automaticity' that they believed to be the original intention of the Articles of Agreement

they had signed after Bretton Woods – that is, countries other than the USA thought they had an automatic right to withdraw their own deposits, albeit in dollars. The US executive director simply vetoed requests that did not comply with the American position, and the practice was for countries requesting drawings of large amounts of foreign currency to approach the USA directly for prior approval (Harmon 1997: 27).

In the 1960s the notion of fixed (par value) exchange rates came under increasing criticism as inadequate for dealing with rapid fluctuations in an increasingly global trading system. Arguments were made instead for fluctuating rates determined more by supply and demand in the international market for currencies. The IMF initially opposed this argument (essentially on Keynesian grounds, but also as a matter of institutional self-preservation), saying that the proper rate of exchange depended on a country's economic policies, and that fluctuations were often caused by speculative transfers of capital. Increasing attention was also paid to problems using gold and the US dollar as the main reserves backing international financial transactions. Some kind of internationally collective reserve unit (or CRU) was suggested in 1962. Then, by agreement among the finance ministers and central bank governors making up a 'Committee of Ten' (the leading economic powers of the time), and at the suggestion of the managing director of the IMF (Pierre-Paul Schweitzer), an amendment was passed to the original Articles of Agreement setting up a Special Drawing Account from which participating countries could exercise Special Drawing Rights (SDRs). This became a new kind of international reserve asset by 1970 just as the gold and oil crises drastically altered the international political economy and, with that, the role played by the IMF (de Vries 1986).

Crisis and transition 1971–79

The IMF traditionally used gold with a value pegged to the US dollar as the basis for international transactions. In the late 1960s, a major devaluation of British sterling caused fears of subsequent devaluations of the US dollar. Speculation drove the price of gold to unprecedented levels. At first a private, British financial group tried to stabilize the price of gold on the London market. But too much money was lost in the process. The market eventually forced the official price of gold to $38 an ounce, and then to $42.20, although there were separate official and private markets and a dual pricing system.

Even the increased official price could not compete with escalating market prices – no one wanted to sell 'official gold' because its price was set too low. Official transactions in gold came to a standstill. In 1971 the USA suspended convertibility of the dollars held by other governments into gold. An attempt was made to fix new exchange rates at a Smithsonian Institution (Washington, DC) meeting of the Committee of Ten, with the IMF Executive Board agreeing to a temporary regime of central exchange rates with wider margins of fluctuation. But even these could not be maintained. First the British pound, along with currencies tied to sterling, was 'floated' – that is, allowed to fluctuate according to demand and supply. Several other major currencies followed. The US dollar meanwhile was devalued twice within fourteen months. An enlarged Committee of Twenty tried in 1973 to come up with a reformed exchange rate system based on 'stable but adjustable' par values, but this was abandoned in 1974, and countries were allowed to determine their own exchange rate system. Eventually three kinds of exchange rate system emerged: 'free floats,' purely determined by currency markets; 'managed' or 'dirty floats,' involving central bank intervention to maintain minimum exchange rates; and currencies pegged to the dollar, or other major currencies such as sterling, and fluctuating with these. With two of its main bases undercut (the gold exchange standard and the par value system), the Bretton Woods system, as originally conceived, came to an end. It appeared that the ability of the IMF to regulate world financial conditions was at least greatly diminished, and perhaps finished (de Vries 1986).

The 1970s, however, saw the IMF re-emerge as an international lending organization on a different, and eventually more powerful, basis. How this came about is a complicated story. As we have seen, until the mid-1970s the IMF tried to make the international monetary system operate smoothly, restoring confidence in major currencies by making temporary loans at times of balance of payments crises. The IMF operated mainly in the interests of the industrial countries – as a kind of global Keynesian club, albeit under the direction of the USA. All this changed with a British application for an IMF standby loan in late 1976. Until the mid-1970s Britain maintained faint vestiges of its previously dominant position in the global economy. Sterling was a major reserve currency and means of international payment, while many countries, especially previous colonies, and countries in which Britain had played a dominant role, kept bank

accounts in the City of London, all this being a source of national income. Yet the manufacturing system that had made Britain 'workshop to the world' had long been in decline, while imports of food, raw materials, oil and industrial goods were increasing. Exactly this contradictory combination of international positions – vital to world financial stability, unstable in terms of trade – made a declining Britain the largest user of IMF funds for the first twenty-five years of the institution's operations. The UK drew $7.25 billion between 1947 and 1971, without much conditionality being attached to the loans (Britain being co-founder of the club) other than very general statements about policy, brief letters of intent, or (during a 1961 stand-by arrangement) an agreement to consult with the IMF in case of a major shift in policy. The Labour government led by Harold Wilson, however, which came to power in 1964, found that Britain was running a trade deficit of £750 million a year, and the Bank of England could not support the pound at an exchange rate of $2.80. The USA, under the presidency of Lyndon Johnson, offered to support the pound under a secret agreement that involved Britain maintaining its defense commitments 'East of Suez' and 'deflating the economy' – that is, restricting credit to reduce demand, cutting public spending and other similar policy measures (Ponting 1989). Then, in 1967, further heavy selling of the pound led the government to a reluctant devaluation (to $2.40) and an application to the IMF for a stand-by arrangement: this time the conditions included a visit to London by a negotiating team from the IMF staff, a detailed letter of intent specifying further deflationary policies, and quarterly inspections, these being interpreted by some members of the Labour cabinet as IMF control of the British economy.

While out of power, between 1970 and 1974, the Labour Party agreed to a 'Social Contract' with the British trade unions under which progressive social policies, including greater state direction of the economy, would create an appropriate climate for wage restraint. The prevailing view in a leftward-moving party was that (internal) growth and employment policies were more important than (external) exchange rate stability. Indeed, the Labour Party was re-elected in 1974 pledging, in its manifesto, to bring about 'a fundamental and irreversible shift in the balance of wealth and power in favour of working people and their families' (Harmon 1997: 4). Even during the 1974–75 recession, wages in Britain rose by 29 percent a year, while inflation ran at 20 percent. Britain's current account was heavily in

deficit, currency reserves fell, and the pound was considered to be still overvalued so that, as the phrase goes, 'confidence in sterling was low' (that is, oil states and private entrepreneurs threatened to move funds to more stable currencies that would hold their values). Even with (market-driven) exchange rates for the pound falling below $1.70 in 1976, and with unemployment rising, leftists in the Labour Party cabinet (Michael Foot, Tony Benn) wanted to reinflate the economy behind a barrier of import restrictions, rather than borrow from the IMF. Indeed, a multilateral international stand-by loan was arranged from the central banks of the USA, Japan and the west European countries, put together under the auspices of the Bank for International Settlements (BIS), with (informal) policy conditions coming from the US Treasury Department. Re-emergence of further pressures on the pound, together with an imminent need to repay the BIS loan, finally led a desperate British government to the IMF in late 1976. The resulting stand-by agreement, resulting from long and difficult negotiations, was made conditional on cuts in public expenditures, including many vital and popular social programs dear to the Labour Party's heart and crucial to its electoral success, together with the announcement of fiscal and monetary targets and a promise not to impose import controls, an anathema to free-trade-oriented organizations such as the IMF.

In an authoritative study, Mark Harmon sees the 1976–77 loan agreement between the IMF and Britain as a turning point in recent political-economic history. 'Economic policy retrenchment in Britain, involving repeated cut-backs in the Government's public expenditure plans and the move to publicly announced monetary targets, was largely the product of coercive external pressures exerted at multiple levels that served to constrict the policy autonomy of the governing authorities' (Harmon 1997: 229). Under the rubric 'coercive external pressures' Harmon includes a chronic lack of international confidence manifested in downward pressures on sterling – that is, the (currency) markets forcing policy changes on the British state. Harmon finds terms such as 'international cooperation,' often used to characterize global economic regimes, disguising a hierarchically organized political economy that includes the exertion of coercive instruments of power. He includes intergovernmental coercion under these 'external pressures,' in this case coercion applied by the governments of West Germany and the USA on Britain. Harmon says that the US government, under Republican Party control, exerted heavy pressure

on the British government, under Labour Party control, to change policy directions. (Indeed, Labour eventually emerged in the 1980s as a centrist rather than a leftist party.) These pressures could not be expressed too directly for reasons of state sovereignty. But pressure could be exerted via a supposedly neutral international organization, as with the IMF. Specifically, Harmon says, US Secretary of the Treasury William Simon believed deficit countries, such as Britain, to be in violation of an international 'code of behavior' that included, under 'responsible' behavior, the setting of 'realistic' goals for public policy, with realistic meaning a reordering of social objectives and a shift in resources toward private investment. The use of the IMF as the instrument for bringing about the desired changes in a sovereign nation's domestic economy, together with widespread publicity surrounding the British loan, 'fostered a belief that a conditional Fund stand-by was politically costly and something to be avoided if at all possible' (ibid.: 233). So the British loan contributed to the widespread view that the IMF was the last of the last places for states to look for external financing. Since 1977 the IMF's loan facilities have been used exclusively by Third World and post-communist governments. Harmon concludes from interviews he conducted that harsh IMF treatment of these desperate Third World applicants has only reinforced the reluctance of First World countries (as with a potential French application in 1983) to seek financing from the Fund. To summarize, after 1977 the role of the IMF effectively changed from being a means of collaboration on exchange rates and payments, mainly among industrial countries, to being a means of First World control over Third World economic policy. As we shall see in more detail, however, even the term 'First World control' is a misnomer that disguises a more narrow and concentrated domination.

The other significant change in the IMF's position occurred as a result of the oil crisis of the early to mid-1970s. In 1973, the Organization of Petroleum Exporting Countries (OPEC) raised the price of oil from $3.01 to $5.12 a barrel. Two months later it increased the price again, to four times the original. First World and Third World (non-oil-producing) countries suddenly incurred greatly increased energy costs, but each group reacted differently. On the whole, with exceptions that included Britain, First World countries had enough income and sufficient hard currency to pay the higher costs of importing oil, although not without significant inflation. Additionally, many First World countries were exporting technology and machinery

to the oil-producing countries so their balances of payments were not drastically disrupted. By contrast, most non-oil-producing Third World countries did not have high technological industry and were stranded without means of paying for oil imports, on which their economies had nevertheless become dependent. These conditions produced a massive shift in the geography of international payments. Oil-producing states accumulated huge surpluses in their balances of payments, while most non-oil-producing countries, especially in the Third World, went into equally serious deficits. Time, it seemed, for the IMF to ride to the rescue.

But the deficits faced by Third World countries were also an opportunity for private financial institutions, especially commercial and investment banks, to step in. Led by Citicorp, a US commercial bank based in New York, banks began extensive lending to the Third World in the late 1960s. The scale of this lending greatly increased in the mid-1970s, when the commercial banks began recycling 'petro-dollars,' deposited in New York and London banks, as loans to Third World governments. These private institutions were less concerned with the social and political responsibilities attending the loans, and were more concerned with the interest earned – on the whole, commercial bank lending was to middle-income, industrializing Third World countries, where it was thought that money could be made. The whole process of inflated lending on easy or non-existent terms resulted in even more debt, without much economic growth to service the loans, and with excess, unnecessary imports contributing even further to national deficits. Increasingly, Third World countries accrued new debt merely to repay interest on the old. Then financial institutions in the West suddenly realized that many debtors were not repaying their loans. The major banks panicked and refused to lend more. Third World countries could no longer borrow to cover their balance of payments deficits. So while the accumulating of indebtedness at first signaled a further potential decrease in the power of the IMF, and an increase in the direct powers of private banks, eventually the reverse happened, and the institution rose to new prominence, with new functions and greater powers of control over even more dependent countries.

Under Johannes Witteveen as managing director, the IMF quickly decided that it should play a leading role in managing the financial predicaments resulting from the oil crisis. In early 1974 the IMF set up a special temporary oil facility, financed by borrowing from member countries, mainly for Third World countries to draw from to pay the

higher oil prices. Also in 1974 the IMF introduced an extended fund facility to give medium-term assistance to Third World countries. And the IMF established a Trust Fund from sales of its gold holdings (no longer needed as SDRs supplanted bullion) to give low-interest, longer-term loans to low-income countries. The funds controlled by the IMF were greatly increased by increasing the quotas paid by national governments from 29 to 39 billion SDR, and establishing a supplementary financing facility based on additional borrowing from member countries. In 1972–78 the IMF approved more than a hundred stand-by arrangements, often for huge amounts, and for longer repayment times. Essentially the IMF survived and prospered by lending the funds for overcoming the world oil crisis and the multiple debt problems associated with it, especially the accumulating commercial bank debt (again the bankers' bank). Yet the IMF did not provide credit simply and unconditionally to countries in need. Instead the degree of conditionality increased markedly as the Fund's geographic emphasis shifted from First World to Third World loans, and as it introduced an Extended Funds Facility to 'give medium-term assistance to members with balance of payment problems resulting from structural economic changes' (IMF 1998a). This latter phrase meant that states could take longer to pay back loans if they promised to implement the very significant structural and economic changes that the IMF thought would ensure their capacity to repay.

As we have seen, elements of policy conditionality had long been attached to IMF financing. But the scope of conditionality expanded as crises occurred in several western European countries, and as more Third World countries joined the IMF in the 1960s. Conditionality is a point of tension between particular national governments and all governments that are members of the IMF, and centers on the Fund's powers of surveillance granted under Article IV. Increasingly in the late 1960s and the 1970s the IMF insisted on the adoption of 'stabilization programs' as prerequisites for stand-by and other financing arrangements. Cheryl Payer (1974: 33) outlined a model of the standard IMF stabilization program of the time as follows:

1 abolition or liberalization of foreign exchange and import controls;
2 exchange rate devaluation;
3 anti-inflationary domestic programs, including: (a) control of bank credit and higher interest rates; (b) lower state budget deficits

through curbs on government spending, increases in taxes, abolition of subsidies; (c) controls on wage increases; and (d) dismantling price controls;

4 greater hospitality for foreign private investment.

Under the guise of stabilizing the balance of payments situation in a country, the IMF engaged in the 'financial programming' of an applicant country's monetary, fiscal and other economic policies under the general term 'conditionality' and employing its powers of Article IV surveillance (indeed, one might add, stretching these powers, which originally dealt only with exchange rates). Following complaints from Third World countries about 'special treatment' being accorded to First World countries (although this treatment was severe enough in the case of Britain in the 1977 stand-by arrangement), the IMF's powers were more exactly specified in its *Guidelines on Conditionality* (IMF 1979). In return for using the IMF's general resources and stand-by arrangements, members were 'encouraged to adopt corrective measures … in accordance with the Fund's policies.' The IMF would discuss adjustment programs with members, including corrective measures, that would enable the Fund to approve a stand-by arrangement. It was agreed that 'in helping members to devise adjustment programs, the Fund will pay due regard to the domestic social and political objectives, the economic priorities, and the circumstances of members, including the causes of their balance of payments problems.' But the *Guidelines* also said that the managing director of the IMF would recommend approval only when he judged that the country's adjustment program was consistent with the Fund's provisions and policies, and when he thought that the program would actually be carried out. Indeed, countries might be expected to put the 'corrective measures' into effect before a stand-by arrangement was approved. Additionally, in the late 1970s, the IMF's annual 'consultations' with member governments were increased in scope following a Second Amendment to the original Articles of Agreement in 1978. Surveillance of exchange practices increased, while 'technical assistance' and training of officials in economic and financial management were expanded (ibid.).

To summarize, in the late 1970s the IMF assumed greater powers of control over longer-term economic policies (structural adjustment rather than short-term stabilization) while still supposedly paying 'due regard for the priorities, and circumstances of members.'

The debt crisis of the 1980s

After rising at a rate of 12 percent per year in the 1970s, commodity prices dropped sharply in the early 1980s, creating catastrophic circumstances for countries dependent on exporting raw materials. Countries partly compensated for the declining terms of trade with increased foreign borrowing. By 1982 the aggregate debt of non-oil-producing Third World countries had risen to $600 billion (de Vries 1986: 183). Debt crisis was triggered in August 1982 when Mexico announced that it could no longer make loan payments on time. Between 1977 and 1981 Mexico had economic growth rates of over 8 percent a year and greatly increased employment. The growth was precarious, however, with the country plagued by inflation and rapidly increasing debt, primarily in the public sector controlled by the PRI, the dominant political party. International interest rates were rising, and Mexico found it increasingly difficult to procure new loans. Investors began withdrawing funds from the country – between 1979 and 1982, US$55 billion in investment funds left (Grindle 1989: 192) – and Mexico's reserves were rapidly depleted. By mid-1982 capital inflows had virtually ceased. International finance responded with an 'emergency rescue operation' in which the central banks of ten developed countries provided short-term funding to Mexico, while a more permanent solution was being negotiated with the IMF. The IMF then approved a loan to Mexico conditional upon the acceptance of a structural adjustment program. The program included a reduction in public sector spending and state deficits that reduced government subsidies on basic consumer goods just as real wages fell precipitously (ibid.).

Brazil was the other large country involved in the debt crisis. Brazil had an import-substitution approach to development (that is, producing previously imported goods locally behind tariff barriers) that produced growth rates of 10 percent a year between 1968 and 1973 (Cardoso and Fishlow 1989: 82). But like many Third World countries, Brazil also borrowed heavily, particularly as the military government built large-scale projects in power, steel and transport infrastructure (Altvater and Hübner 1987: 140). This made Brazil increasingly dependent on the world economy and the financial markets. In the early 1980s international interest rates rose while the world (particularly the USA in 1980 and 1981/82) fell into recession. Brazil was unable to procure additional loans, while prices for its exports dropped significantly. Brazil announced a moratorium on

the repayment of foreign debts in 1982. The IMF imposed a policy regime similar to that required of Mexico. Brazil reluctantly turned from the growth path it had been pursuing and toward one that it was told could service debt. Currency depreciation, lower real wages, cuts in government subsidies and economic instability resulted. Brazil's economy stagnated. By the mid-1980s three-quarters of Latin American countries and two-thirds of African countries were under some kind of IMF–World Bank supervision.

The main players in the debt business were: the IMF, the Western commercial banks, and the First World governments on one corner of a triangular system; the governments of impoverished, oil-importing countries on another; and the people of the affected countries on the third. Concerned mainly with ensuring that loans were repaid, the IMF and the commercial banks developed an uneasy relationship of mutual support. The commercial banks needed the IMF to ensure loan repayment, and the IMF could do this with stabilization and structural adjustment measures imposed as conditions for loans ensured by the state. In return for playing this essential role, denied to private banking institutions, the IMF demanded that the commercial banks contribute even more money for international lending. This made the IMF a more powerful institution again, while increasing the profits of the commercial banks ($500 million profit in Mexico, $1 billion in Brazil), but left Third World countries even more heavily indebted (Chahoud 1987: 32). In the end, however, the people of the debtor countries paid the price in terms of unemployment, cuts in services and higher prices for basic necessities.

Another aspect of the changed conditions of the 1980s was a further rise in currency and other forms of financial speculation, which essentially turned Third World debt into a market opportunity. In an attempt to ensure partial repayment, commercial banks began selling the loans. In the 'used loan' market private capital interests bought the loans of Third World nation-states and, in exchange, received the loan value in the currency of the debtor country, which they then invested in that country. Private investors began speculating on the values of currencies and investing where they thought returns would be highest. Financial speculation brought on by the used loan market further destabilized non-Western economies that the IMF was supposedly stabilizing. At the same time, the IMF demanded that national governments (as part of loan conditionality) ensure economic stability by assuming greater responsibility for the loan-repayment

capabilities of the private sector of the economy as well, even taking over private loans where necessary. For example, if financial crisis struck the private banks of Ecuador, the Ecuadorean government was responsible for stabilizing the economy so that foreign investors did not lose money. In this way too the burden of debt was transferred from the banks of the First World to the banks of the Third World, to their governments, and eventually to their people (ibid.: 33).

The formula used by financial institutions to handle the debt crisis was called 'rescheduling.' During the first phase of the debt crisis, from 1982 to 1985, possible default by Third World countries was met by new loans organized by commercial banks, the IMF and other lenders. New lending under rescheduling was supposed to provide a respite enabling indebted countries to put their finances back in order, and resume repayment of their debts. The indebted countries had to follow IMF-sponsored adjustment measures that included raising taxes, raising tariffs, devaluing the currency and usually reducing government expenditure (more drastic structural adjustments were not yet seriously considered because the fundamental problem was thought to be temporary 'illiquidity,' that is lack of assets, such as cash, immediately available for settling financial obligations). Debt relief took the form of payment rescheduling, sometimes on concessional (low-interest) terms, sometimes coupled with new loans. Creditor governments formed a committee to deal with debt relief, in consultation with the IMF, which was hosted by the French Treasury and known as the 'Paris Club.' Repeated Paris Club rescheduling of debts led official lenders eventually to recognize that a new approach was needed for these countries.

Continuing efforts by the USA to find a position adequate for responding to a deteriorating debt situation culminated in a proposal made in October 1985 by James A. Baker III, secretary of the Treasury between 1985 and 1988 in the Reagan administration, in what came to be known as the 'Baker Plan.' To prepare for announcing the plan Treasury Secretary Baker summoned the chief executives of the largest US banks – Chase Manhattan, Citibank, Bank of America, along with Paul A. Volcker, chairman of the Federal Reserve Board – to a meeting (Rowe and Henderson 1985: A14). US Treasury and State Department officials, with Richard Darman, deputy secretary of the Treasury (1985–87) playing a main role, had been working on the plan for months, concerned that social and political pressures from the debt crisis could explode, particularly in Latin America.

The idea was that the IMF and the World Bank should join forces to increase the amount of loans available from both institutions and the commercial banks. But loans would be made conditional on 'policy improvements in the macroeconomic framework' under structural adjustment programs (SAPs) – the 'policy improvements' being in line with right-wing notions of the causes of growth (markets, privatization, deregulation of private enterprise, reducing state deficits, and so on). The new strategy for managing the debt crisis essentially read as follows:

1 The principal debtor countries, some fifteen middle-income Third World countries, owing a total of $437 billion, and paying interest rates of around 10 percent, would get an additional $29 billion in loans over three years, with $20 billion coming from commercial banks, the rest from international lending agencies, mainly the IMF and the World Bank.
2 To get these loans debtor countries would have to make 'structural changes' that were supposed to invigorate their economies, enabling them to 'grow their way out of debt' – these were more fundamental market-oriented reforms than previously, such as tax reduction, privatization of state-owned enterprises, reduction of trade barriers and investment liberalization (that is, allowing unrestricted access for foreign investors).
3 While the IMF would have a continuing, central role in enforcing these macroeconomic changes, the Fund was considered to be primarily a short-term lender and, believing that longer-term 'structural' solutions were necessary, the US Treasury and State Department wanted the World Bank to become more involved in 'modernizing' the economies of the debtor countries.

The Baker Plan was immediately accepted by the IMF. The commercial banks, however, proved wary about making new loans without guarantees from official sources. So commercial lending to debtor countries actually decreased following announcement of the Baker Plan, while official lending from the IMF and the World Bank, as well as the government of Japan, took its place: between the end of 1985 and late 1988, net lending from the public sector to the countries covered by the Baker Plan amounted to $15.7 billion, while new money from private banks amounted to $12.8 billion. Interest payments remained high – $30 billion a year continued to flow out of Latin America, for instance. Over the next three years the official

view became that the Baker Plan had failed, and that more extreme debt-reduction measures were necessary.

Throughout the 1980s debtor nations and commercial bank creditors had engaged in repeated rounds of rescheduling and restructuring sovereign-nation and private-sector debt. This led broad sectors even of financial and quasi-official opinion toward the recognition that some of the loans would never be repaid. For example, US Senator Bill Bradley (Democrat, New Jersey) argued that Latin American governments friendly to the USA would not be able to stay in power unless their debts were reduced or simply canceled, while new loans were of little good because they were used largely to pay off old interest charges. When the (Republican) Bush administration assumed office in 1989, the new secretary of the Treasury, Nicholas Brady, announced that the only way to address the debt crisis was to 'encourage' the banks to engage in 'voluntary' debt-reduction schemes – the plan resulted from previous work by David Mulford, Treasury under-secretary for international affairs (Rowen 1989). Under what became known as the Brady Plan, countries were to implement market-oriented structural adjustment, as with the Baker Plan, but this time in exchange for a reduction of commercial bank debt and, often, new loans from commercial banks and multilateral lending agencies (Blustein and Rowen 1989). For example, in the case of Mexico, an advisory committee, consisting of the Mexican government and representatives of some five hundred banks, negotiated a 'menu' of options that the banks could choose from to reduce (or increase) their debt exposure: existing loans could be swapped for thirty-year debt-reduction bonds that would provide a discount of 35 percent of the face value – that is, reducing Mexico's debt by this amount – with the bonds compensating the lender with an interest rate slightly above market rates; existing loans could be swapped for thirty-year par (face value) bonds with a below-market interest rate that would effectively reduce Mexico's debt service on those loans; and banks could also provide new loans of up to 25 percent of their 1989 exposure at market interest rates. In effect the banks, as creditors, would grant debt relief in exchange for greater assurance of the collectability of the rest in terms of principal and interest. In exchange for forgiving part of Mexico's debt, the principal and interest of the new bonds banks received were securitized (backed) by US Treasury bonds, which in turn were financed by the international financial institutions – the World Bank and the IMF would provide $12 billion

each, and the Japanese Import–Export Bank provided about $8 billion for securitization. Also what came to be called 'Brady bonds' could be bought and sold on financial markets, often at considerable discounts. The IMF Executive Board immediately adopted most of the Brady Plan linking debt reduction to structural adjustment, and US Treasury officials pressured initially skeptical creditor banks into making Brady deals. By May 1994, eighteen countries had agreed to 'Brady deals' forgiving $60 billion of debt and covering about $190 billion in bank claims. The typical Brady deal leads to 30 to 35 percent forgiveness of a country's debt (Vasquez 1996). Behind this flurry of debt rescheduling and relief activity, strong political pressure was exerted by national governments, especially the USA, usually operating in concert with the Paris Club and the IMF. The main concern of this group of actors was preserving the banking system in the face of the possibility of repudiations of hundreds of billions of dollars in unpayable debts.

Capital account liberalization

Looking again at the original Articles of Agreement forming the mandate for the IMF, we notice that: in Article I paragraph (iv) the institution was to establish 'a multilateral system of payments in respect of current transactions between members'; in Article VI member countries might exercise controls over capital transfers but not restrict payments for current transactions; and under Article XXX payments for current transactions, dealing with trade and other current business, including services and short-term banking and credit services, lie within the IMF's jurisdiction, while capital transactions, which are payments for the purpose of transferring capital, do not. In other words, the IMF was to regulate financial issues arising from trade in goods and services that appear in the current accounts of countries' balances of payments. Private capital movements to 'emerging markets' that were not directly related to trade, however, increased rapidly in the early 1990s. To facilitate these movements, the international banks and the US Treasury pushed governments into rapidly opening all parts of their financial markets to foreign entry. In September 1996, the Interim Committee of the IMF asked the Executive Board to investigate changing the IMF's Articles of Agreement so that it could address issues arising from the growth of international capital flows. In April 1997, the Interim Committee said that the Articles might be amended to enable the IMF to promote the 'orderly liberalization of

capital movements.' By this the Committee meant removing national (state) regulations on financial markets in member countries and removing all restraints on the free international movement of capital and all kinds of financial instruments and transactions – what the Fund called 'an open and liberal system of capital movements' (*IMF Survey*, 6 October 1997: 291). In line with this, the September 1997 joint meeting of the IMF and the World Bank in Hong Kong was supposed to give the Executive Board a mandate to complete work on amending the Articles of Agreement, so that the IMF would openly and actively promote capital account liberalization and extend its jurisdiction over global capital movements – a momentous extension of the Fund's original powers.

Then, on 2 July 1997, a speculative attack on the baht, the Thai currency, caused an overnight decline in value of 25 percent, followed by further waves of speculation aimed at the currencies of Korea, the Philippines and Indonesia, in what built into the East Asian crisis – failing banks, plummeting GDP, rising unemployment – which left the 'miracle economies' floundering for years. Even worse for the IMF's case, the 'financial liberalization' that had already occurred was widely seen as contributing to the massive flows of speculative capital into, and out of, many of the East Asian economies – Joseph Stiglitz (2002a: 89, 99), for example, calls capital account liberalization the single most important cause of the East Asian crisis, and the crisis itself the worst since the Great Depression. The IMF had been active in Thailand, urging the government to devalue the baht, cut it loose from its peg to the dollar and float it. The same day (2 July) that the government complied, the IMF praised its 'comprehensive strategy to ensure macroeconomic adjustment and financial stability' (the stock phrase for all such circumstances) while the baht was nosediving, followed by the currencies of most other East Asian countries after similar advice from the IMF – even the *Wall Street Journal* said of this: 'The IMF tripped this crisis by urging the Thais to devalue, then promoting contagion by urging everyone else to do likewise. Now Mr. Camdessus [managing director of the IMF] and Treasury secretary Robert Rubin want fresh billions to deal with the train wreck' (Wall Street Journal 1999: 120).

For the IMF, by comparison, the East Asian crisis stemmed from internal weaknesses in the financial and governance systems of the affected countries:

> A combination of inadequate financial sector supervision, poor assessment and management of financial risk, and the maintenance of relatively fixed exchange rates led banks and corporations to borrow large amounts of international capital, much of it short-term, denominated in foreign currency, and unhedged. As time went on, this inflow of foreign capital tended to be used to finance poorer-quality investments. Although private sector expenditure and financing decisions led to the crisis, it was made worse by governance issues, notably government involvement in the private sector and lack of transparency in corporate and fiscal accounting and the provision of financial and economic data. After the crisis erupted in Thailand with a series of speculative attacks on the baht, contagion spread rapidly to other economies in the region that seemed vulnerable to an erosion of competitiveness after the devaluation of the baht or were perceived by investors to have similar financial or macroeconomic problems. (IMF 1999)

The IMF claims to have then restored international confidence by 'helping' the three countries most affected by crisis – Indonesia, Korea and Thailand – to adopt programs of economic stabilization and reform in return for lending SDR 26 billion (US$35 billion) and arranging US$77 billion of additional loans from other sources. The IMF subsequently forced 'comprehensive reforms' that included increased foreign participation in domestic financial systems, increasing the power of free markets and breaking traditionally close links between business and governments. Exactly these links between government and business have, however, been main causal factors lying behind East Asian industrialization, while integration with international financial markets was thought by many to be the basic cause of the crisis. In this case, the IMF's policies in East Asia were criticized by Keynesian liberals and Friedmanesque neoliberals alike (see McQuillan and Montgomery 1999) and, as a result, the institution's reputation has never recovered, even in circles that the Fund values. Now the 'middle income' Third World countries of South-East Asia and Latin America follow the west European countries in also not going to the Fund in times of crises.

As a result of the East Asian crisis, the almost completed IMF capital account liberalization project faced a far more critical response. But the IMF continues to argue for it. So when Michel Camdessus (1998) was asked whether, with the still-deepening crisis in Asia,

capital account liberalization was such a good thing after all, and was the IMF the right institution to oversee countries' efforts to implement it, his answer was 'clearly yes.' It was right because the theory behind it was correct. That is, free capital movements help channel resources into their most productive uses, and thereby increase economic growth and welfare, nationally and internationally. The fact that the IMF had been called upon to finance balance of payments problems associated with capital accounts provided yet one more compelling reason why the Fund's jurisdiction should be extended to capital account issues. So in the managing director's view capital account liberalization must be 'bold in its vision, cautious in its implementation.' A different view of why the IMF persists in trying to open financial markets is provided by Jagdish Bhagwati, a prominent advocate of free trade. Bhagwati says that the Wall Street investment banks want to be completely free to put money into countries and take it out, while the Fund sees itself as lender of last resort and manager of the whole capital system: 'Morgan Stanley and all those gigantic firms want to be able to get into other markets and essentially see capital account convertibility as what will enable them to operate everywhere. Just like in the old days there was this "military–industrial complex," nowadays there is a Wall St.–Treasury complex' (interview, 1997, in Wade and Veneroso 1998: 18–19).

Hence capital account liberalization is still on the IMF's agenda. For critics, of course, this shows that when the IMF makes a mistake, as clearly (to almost everyone outside the institution) it did in East Asia, its response is to ask for new powers that would increase its capacity to make even more harmful mistakes in the future.

New debt crisis in Latin America

Latin American countries following free market policies have grown at a fraction of the rate they grew at in the 1970s and 1980s, when governments followed more interventionist and protectionist policies. In the late 1990s, and continuing in the early 2000s, many Latin American countries, following IMF-approved stabilization and restructuring programs, became economically depressed. The most serious case was Argentina, which had an exchange system that fixed the peso to the dollar, but also overpriced its exports and undercut its international competitiveness – the economy began a serious contraction in 1998. The country's accumulating debt burden ($128 billion), though not enormous relative to the size of its overall economy,

became unsustainable, as exports decreased. Fears of financial collapse led to the movement of assets out of the country. Argentina received $13.7 billion in IMF aid in the closing days of Bill Clinton's administration, but the incoming George W. Bush administration expressed reluctance to allow repeated bailouts of what it saw as failing economies. On the occasion of a new approach to the IMF in August 2001 for a further loan, the Bush administration tried to use Argentina's financial crisis to demonstrate its new, skeptical approach to financial bailouts, breaking 'an overly accommodating stance' by the Clinton administration. When Treasury Secretary Paul O'Neill and other Treasury officials met with the Argentine delegation to Washington the initial response was to decline to commit new aid. A description of the subsequent negotiations in the *New York Times* gives some idea of the power politics involved:

> It is not unusual for the United States, the largest single shareholder in the fund, to play an important role in shaping an emergency aid package to a large developing country. But several people involved in the talks said the administration's role was especially intricate in this case, with many late-night sessions held in Treasury offices rather than at I.M.F. headquarters nearby. Bush administration officials pressed a team led by Daniel Marx, Argentina's finance secretary, to come up with ways of reorganizing Argentina's finances and debt payments so that it could survive without fresh loans. (Kahn 2001a)

If there were to be new loans, the USA and the IMF wanted Argentina to demonstrate that the money would last beyond the usual terms of three years. Treasury Secretary Paul O'Neill said: 'We're working to find a way to create a sustainable Argentina, not just one that continues to consume the money of the plumbers and carpenters in the United States who make $50,000 a year and wonder what in the world we're doing with their money' – remarks that *La Nación*, a leading Buenos Aires newspaper, found 'outside all norms of respect and protocol.' After nearly two weeks of negotiations, the IMF announced $8 billion in emergency aid to Argentina to stabilize its economy, of which $5 billion would be lent immediately, and the other $3 billion delayed, awaiting a rescheduling of debt payments, a new and more forceful (even positive) approach. Other elements of the aid package included the usual IMF prescription of fiscal discipline and reduction of central and provincial government spending. The Argentine government then froze bank accounts and began raiding

pension funds to find hard currency to make debt payments. In 2002 the economy minister announced that Argentina would no longer use its diminishing foreign reserves to pay back IMF loans and that while Argentina hoped to reach a new agreement with the IMF, it was 'not going to sign just any old agreement … and would … not renounce its policy of social assistance' (Rohter 2002b). In September 2003, Argentina announced a temporary default to the IMF, until the Fund backed down. The result was rapid economic recovery.

An assessment by the IEO of the role of the IMF in handling the Argentine debt crisis during the decade 1991 to 2001 found that sizeable damage had been done to the Fund's reputation: associating it with inappropriate policies, creating a perception that it lacked even-handedness in dealing with member countries, and putting its role in signaling sound policy environments into question (BWP Update 42). This view is buttressed by a report from the US think tank Center for Economic and Policy Research. The Institute found that IMF projections of future economic growth were consistently wrong for Argentina, overestimating 'projections' of future growth when Argentina was following Fund prescriptions, and underestimating them when the country was in dispute with the Fund over debt renegotiation. The report concluded: 'The IMF's large and repeated errors in projecting GDP growth in Argentina since 1999 strongly suggest that these errors were politically driven' (Rosnick and Weisbrot 2007: 2). Widespread riots, the collapse of the government and continuing economic chaos had led to even more questions about the effectiveness of the IMF and the international financial policies of the USA, as with virtually all major financial agreements, including those in Mexico, Thailand, Indonesia, South Korea, Russia and Brazil.

Brazil had been the poster country of free market orthodoxy during the eight years of the presidency of former dependency theorist Fernando Henrique Cardoso. But following the advice of the IMF and the World Bank on restructuring the Brazilian economy resulted in only modest economic growth, of about 3 percent a year, and a public debt of $240 billion. In elections for a new president in 2002 the leftist candidate from the Workers' Party, Luiz Inacio Lula da Silva, promising relief for poor people, became the leading candidate. In the summer of 2002 a crisis in investor confidence, a plummeting currency (which lost 20 percent of its value in a month) and the prospect of a new government defaulting on the public debt led to a financial crisis, and an urgent request for an IMF loan of $30 billion.

The conditionality in this case was that most of the loan ($24 billion) would be delivered only if the new government, whichever one was elected, met certain budgetary targets over a period of three years, a stipulation seen as an intrusion into Brazil's sovereignty. Commenting on the situation in Latin America, the *New York Times* said: 'The standard advice of the Fund to clients facing crisis has been to insist on increased austerity, arguing that fiscal discipline is a necessary precondition to prosperity. But that translates into enormous suffering for millions of people, strengthens the appeal of left wing critics of free market economies and weakens governments that have made the changes Washington is urging' (Rohter 2002a: 3). All candidates in the Brazilian election, including 'Lula,' were forced by the financial emergency to agree with the IMF's conditions. The US Treasury tried to reassure investors that even if the Workers' Party won the election Brazil would get through the crisis. Wall Street, however, thought differently. 'When you look at the numbers, it's pretty tough to make them add up,' said Larry Kantor, chief of global currency strategy at J. P. Morgan Chase. 'The markets have to assume the worst,' said Rodrigo Azevedo, co-chief of Latin American research at Credit Suisse First Boston in São Paulo. 'The markets have clearly not been willing to give Brazil the benefit of the doubt' (Andrews 2002c: 6). The problem is that judgments such as these by 'financial analysts' determine the amount of capital flowing into Brazil and this (especially given the country's 'opening up' under IMF mandate) determines growth and employment. George Soros (himself no stranger to high finance) said that 'The system has broken down … It does not provide an adequate flow of capital to countries that need it and qualify for it' (in ibid.: 6). Or elsewhere, speaking about extensive IMF and international investor involvement in the Brazilian elections, Soros said: 'In ancient Rome, only the Romans voted. In modern global capitalism, only US financial agents vote, not Brazilians' (Semple 2002: A4). In particular, critics see IMF involvement as the subversion of democracy by an autocratic institution convinced that it knows best. But even this might be an optimistic appraisal – for the *New York Times* went on to say that the G. W. Bush administration 'continues to be baffled as to a long term solution' to the problem of the contraction of Latin American economies, and that asked why countries were 'increasingly rejecting the magic recipe of privatization, lower tariffs and increased foreign investment, [US] Treasury Secretary Paul H. O'Neill replied, "I have no idea"' (Rohter 2002a: 3). What O'Neill, Bush and the

others cannot reveal, and perhaps cannot realize, is that financial markets rule over political democracy rather than constituting it. In brief, the Argentina and Brazilian cases, together with imminent debt repudiation in Uruguay, and problems in Paraguay, Ecuador and Colombia, suggest systemic crisis in Latin America caused by a level of market failure that may well transcend the recuperative abilities of global governance.

The response to this crisis, discussed at the September 2002 IMF–World Bank meetings, and among the finance ministers of the Group of Seven industrial countries, was a new legal framework under which countries undergoing severe financial crisis would be able to enter something like a bankruptcy proceeding. The idea behind this had been 'floated' by several academics but 'not taken seriously' or 'never publicly embraced' (as the saying goes in inner circles) until, in November 2001, Anne Krueger, first deputy managing director of the IMF, and a former academic and member of the Hoover Institution, a conservative think tank in Palo Alto, California, raised it again with the name of Sovereign Debt Restructuring Mechanism (SDRM). The plan would fill what Krueger called a 'gaping hole' in the international financial system by establishing a formal bankruptcy process for nations undergoing severe financial difficulties, allowing them to stop paying debts while they negotiated with bankers and bondholders. The proposal was modeled on Britain's bankruptcy laws. A nation could apply to the Fund for the right to declare bankruptcy. Under the new approach, a country would approach the IMF and request a temporary standstill on the repayment of its debts, during which time it would negotiate a rescheduling or restructuring with creditors over a period of several months. If the request was agreed to by a majority of creditors could decide terms for the whole. The new approach was necessary because most private money lent to the richer developing countries recently has come from bond investors. When over-indebted countries, such as Peru, have sought to lower payments to their creditors, some bond-holders have filed lawsuits in their home-country courts, based on their contractual rights to receive full payment of interest and principal. Countries could also impose temporary foreign-exchange controls to prevent a rapid outflow of private funds. The arrangement would not legally extend the power of the IMF, but would override current US law, which allows any bondholder to sue for full payment in the event of a default. The plan faced severe opposition on Wall Street, where it was thought that it would

end 'emerging-market' debt finance: bankers and brokerage houses warned that investors would move their money out of developing countries rather than risk having funds impounded in an international bankruptcy proceeding. Charles H. Dallara, managing director of the Institute of International Finance (IIF), called it 'a nuclear-bomb solution that could really backfire.' The IMF, he said, wanted to cast itself as bankruptcy judge even though it was often the largest creditor and sought to protect its own loan portfolio. By comparison, the interests of private investors did not rank as high. The US government too was for a long time hostile to the SDRM. But financial collapse in Argentina gave renewed impetus and the new plan fitted into a change in the Bush administration's position after September 11, 2001, toward seeing the problems of developing countries not only as economic issues, but also as part of a national security strategy (Andrews 2002b). And the IMF staff, while at first antagonistic to the idea, came round to endorsing it as part of a reconsideration of position in response to the Latin American debt crisis. With support from political and bureaucratic sources, and in the context of economic and political crisis, the US Treasury Department and the finance ministers of the other industrial countries endorsed the plan in 2002, overriding Wall Street objections (Blustein 2001; Andrews 2002b).

Protesting the Fund

IMF policies have long drawn massive and violent protest from the millions of people adversely affected. Until the mid-1970s, when IMF conditionality took a turn for the austere, controversy over the Fund had taken the form mainly of intergovernmental arguments, between the USA and Britain, for instance, or between First and Third World members, and squabbles between governments and the institution – that is, between treasuries and ministries of finance on the one side, and the Executive Board, managing director and staff of the IMF on the other. But as conditionality came to be more drastically imposed on Third World countries, popular discontent quickly escalated. Protest often began as 'food riots' – people opposing sudden increases in the price of food – within overall 'austerity protests' – people objecting to broader aspects of a deteriorating situation, such as wage cuts and the elimination of government subsidies – all these being conditions imposed on national governments by the IMF in return for the granting of desperately needed loans.

For example, on 8 March 1976, workers in Cordoba went on strike

to protest about the Argentine government's freezing of wages for 180 days. National business organizations also protested against the government's decision. The government's intention was to meet the IMF's conditions for credits to offset increased costs of oil imports by lowering the rate of inflation, and increasing savings, in order to reduce Argentina's foreign debt (*New York Times*, 9 March 1976).

In January 1977, riots broke out in Egypt after the government decided to lift subsidies on staple foods (*New York Times*, 21 January 1977). Rescinding of the subsidies to reduce Egypt's balance of payment and budget deficits was encouraged by the IMF, the USA, Saudi Arabia and Kuwait. Twenty-four people were killed as the army put down the riots. Eventually, Saudi Arabia and Kuwait loaned Egypt $1 billion to cover balance of payments deficits and the Egyptian government restored many of the food subsidies (*New York Times*, 6 May 1981).

On 1 July 1981, a general strike was called by the Democratic Workers' Confederation in Casablanca to protest against the Moroccan government's decision to lift subsidies on staple foods at the IMF's insistence as a condition for a $1.2 billion loan for a balance of payments deficit and foreign debt restructuring. The removal of subsidies caused the price of butter to go up by 76 percent, wheat flour by 40 percent, sugar by 37 percent and cooking oil by 28 percent. The strike turned into rioting by thousands of youths from the shanty towns encircling the city. The army and police fired into the crowds, killing sixty-six people according to the government, and 637 people, mostly children and teenagers, according to the opposition Socialist Movement (*New York Times*, 4 July 1981).

On 24 April 1984, cities in the Dominican Republic erupted as business, labor, leftist organizations and youth struck and protested against government-imposed austerity measures. Under the conditions of an IMF loan, the government had lifted subsidies on imported goods, forcing the price of medicines to increase by 200 percent. The protest turned into a riot and the police and military overreacted: fifty people were killed and four thousand arrested. Officials in the Dominican Republic criticized the IMF for trying to impose policies without regard for the specific history, culture and social climate of the country (*New York Times*, 29 April 1984).

Nigerian protests began in April 1988 as a reaction to the lifting of subsidies on petroleum products, and continued over two decades. What began as labor strikes soon included a student uprising, with

several universities closed for long periods. IMF structural adjustment programs affected more than just petroleum prices – social services, such as healthcare, were adversely affected while many state subsidies, including those on food staples, were lifted – all of this coming with severe devaluation of the national currency.

In Venezuela, previously a bedrock of stability and democracy, protests were seen as direct responses to the destabilizing effects of structural adjustment programs. Venezuela was a relatively well-off, oil-exporting country, yet by the end of the Latin American debt crisis of the 1980s it had accumulated $33 billion in foreign debt. Protests in Venezuela centered on an increase in petroleum prices resulting from removal of government subsidies. Hundreds were killed in protests in 1989 as a reaction to increasing bus fares after petroleum prices were raised (*New York Times*, 28 February 1989). As with the Nigerian case, IMF-imposed austerity measures included cutbacks in the social sector, which fueled further protest. As the *New York Times* reported, 'Venezuela's president said dozens of people had been killed and hundreds wounded in rioting today … over economic measures imposed by the Government to satisfy its creditors' (*New York Times*, 1 March 1989). When the president announced that Venezuela might have to suspend payment on the country's debt to quell the violence, the USA granted 'emergency loans of $2 billion to get them through their trying times' (*New York Times*, 4 March 1989).

In spring 1998 massive unrest and violent riots in Indonesia directly resulted from IMF-mandated reductions in government subsidies. As with other protests of the time, opposition focused mainly on reductions in food and petroleum subsidies. Collapse of the national currency, the resulting international bailout, mass rioting and the eventual resignation of the president were all intricately connected with IMF intervention. The saga began in 1998 when the IMF gave the Indonesian government, under a clearly corrupt President Suharto, a $40 billion loan package. In return, Suharto had to agree to stringent austerity measures. A *New York Times* article summarized the situation: 'It is the IMF that will decide when the Indonesians have done enough to earn the next aid installment. But the United States holds a de facto veto over such decisions, and so the talks with Indonesia have been a delicate, three-way dance between Mr. Suharto, economists and top officials from the IMF and American officials in Jakarta and Washington' (*New York Times*, 25 March 1998). In May 1998, a 70 percent increase in the prices of fuel and electricity widened the

protests (*New York Times*, 6 May 1998, 16 May 1998). Businesses were burned, ethnic tensions grew as protesters targeted Chinese Indonesians, and by the time Suharto resigned later that month, some twelve thousand lives had been lost (*New York Times*, 6 July 1998). According to the *New York Times*, 'American and IMF officials have concluded … that they moved too hastily in insisting on breaking up food monopolies and ending subsidies on essentials like fuel. While the subsidies are expensive, they may be the only way to keep social unrest from seizing the country' (25 March 1998). Even so, as a later article concluded, 'Treasury officials today acknowledged that Indonesia has failed to meet some of the most important conditions that were imposed by the International Monetary Fund in return for a $40 billion bailout package. Nevertheless, they said, the United States expects to vote in favor of gradual resumption of aid' (*New York Times*, 1 May 1998).

In general, popular protests against the IMF and national governments tend to follow a similar path. Using the cases of 146 'austerity protests' in 39 countries in the period 1976–92, John Walton and David Seddon (1994) reach the following conclusions. They define 'austerity protests' as 'large-scale collective actions, including political demonstrations, general strikes, and riots, which are animated by grievances over state policies of economic liberalization implemented in response to the debt crisis and market reforms … devised and implemented by the International Monetary Fund' (ibid.: 39). Austerity protests, they say, tend to occur under these conditions: first, they almost always happen under circumstances of rapid urbanization and sudden increases in population size; second, they occur in places with recent histories of substantial political activism, organized and institutionalized through unions, community organizations, mosques, temples or churches; third, they do not occur in the areas of greatest hardship and suffering; fourth, and most significantly, they happen when people think that an injustice has been done – specifically that the 'social contract' between people and government has been broken (ibid.: 42–54). They explain that 'countries with large, poor urban populations experience protests when governments impose policies with repressive social class consequences in the interest of serving foreign debts' (ibid.: 887). The groups most drastically affected include the working poor, parts of the middle class, students and other urban dwellers. The elimination of governmental subsidies, mandated by the IMF, causes a rise in consumer prices. Together with currency

devaluation and wage cuts, this causes hardship for city dwellers that often results in protest.

In the Walton and Seddon explanation, to which we add some of our own ideas, many Third World states established implicit social contracts with citizens in the 1960s and 1970s. Many Third World countries, particularly in Latin America, pursued import substitution policies aimed at protecting local industry against foreign competition. Import substitution was pursued by a developmentalist alliance among commercial farmers, state bureaucrats, national industrial capitalists, urban merchants and urban middle and working classes. Rapid urbanization from 1950 onward forced governments to focus on satisfying the needs of city residents or risk constant political turmoil (Cardoso and Faletto 1977: 131). While the urban upper and middle classes profited directly from the protections afforded by import substitution policies, the rest of the urban populace, the working class and the poor, was incorporated into the developmentalist alliance via state subsidies on basic necessities. The social contract consisted of an unspoken agreement that urban dwellers would give their political allegiance to the government in exchange for these subsidies. But the bargain between the urban poor and the state came to rely increasingly on funds provided by foreign loans. With economic recession, and the rise in oil prices in the 1970s, foreign lending carried new neoliberal conditionalities. Lifting of subsidies on basic goods under IMF mandates provoked austerity riots not only because of the threat of starvation, but because the agreed-upon meaning, or the 'historicity' (Touraine 1988: 8), of what constituted social progress was broken, and a new historicity, originating with the IMF, came into force, one that prohibited the state from fulfilling its side of the social contract.

The state's legitimacy rested on the popular perception, seen mainly in terms of the prices of necessities, that it was committed to the social contract. When the price of food was no longer determined by the state, or even by public opinion, but was determined by the market under IMF mandate, then price no longer expressed an agreed social contract. Instead price represented collusion between what was now revealed to be an unjust, illegitimate, authoritarian government and a distant, international monetary institution. A new meaning came to define society's development: unregulated economic growth benefiting foreign capital and already rich people. The new meaning implied that money and profit had become more important than

the lives of the poor. Society's poor and weak were being sacrificed on the altar of profit. This new symbolic meaning provoked revolt against the symbols of wealth: treasuries, national banks, the legislature, presidential palaces, travel agencies, foreign automobiles, luxury hotels and international agencies symbolizing the national and international forces behind the lifting of subsidies have all been targets for protesters (Walton and Seddon 1994: 43). Let us add that many people have been killed during IMF austerity protests – at least tens of thousands, and perhaps a hundred thousand. The number of people who die as a result of the social and economic effects of IMF austerity programs, from the increased incidence of starvation and the concomitant reductions in health programs, has never been reliably estimated, although by one account 6 million African, Asian and Latin American children are said to die each year from the effects of structural adjustment (Budhoo 1994: 21–2).

Since the late 1980s, the mainly national demonstrations against IMF austerity programs have become international protests. The 1988 annual meetings of the IMF and the World Bank, the largest since Bretton Woods, held in West Berlin during the last week of September, and bringing together 13,000 bankers and financial officials, were met for the first time by massive protest, organized by First World Western opposition groups, and attended by tens of thousands of non-Third World citizens. Twenty thousand demonstrators drawn from a number of leftist causes marched through the city protesting 'against IMF policies towards developing nations' (*New York Times*, 26 September 1988). The Third World Congress, made up of representatives from impoverished Third World countries, issued a call for debt cancellation, while a broad range of people expressed concern about world hunger and poverty (*Guardian*, 26 September 1988). Taking place in western Europe, at the center of a major national member of the IMF, the protests were given considerable media attention. Small protest demonstrations met virtually all subsequent meetings until the Seattle demonstrations against the WTO in 1999, since when all meetings of the IMF, the World Bank, the G7 and G8 meetings among major Western economic powers, and virtually every other 'economic summit' have been met by massive protests.

NGOs

The recent demonstrations have been coordinated by a number of NGOs and protest groups, including some formed specifically to

oppose IMF and World Bank policies. Jubilee 2000 is a faith-based movement, with significant secular participation, which works to persuade governments to provide debt relief for the world's poorest nations. The coalition originated in the UK in the early 1990s, and currently has support groups in sixty-five counties. In scriptural terms (Leviticus 25:8–12), the concept of a jubilee means that every fifty years, land is restored to its original owners, slaves are released, and there is a general remission of debts. The year 2000 was considered an ideal time for a jubilee. In the Christian community the new millennium marked the 2,000th anniversary of the birth of Christ, while beyond religious circles the turn of the century was a major media and popular cultural event. Jubilee 2000 argues that the world's poorest countries spend more repaying foreign debt than they spend meeting human needs, such as healthcare, sanitation and education. The coalition claims that 7 million children die each year as a direct result of the burden of debt repayment. So they called for 'a one-off cancellation of the unpayable debts of the world's poorest countries by the end of the year 2000, under a fair and transparent process' (www.jubilee2000uk.org). Because of its biblical slant, the coalition was able to make debt forgiveness into a moral, rather than a political, issue, and this broadened the base of support: for example, the Pope is an ardent supporter. By 2000 promises of $100 billion in debt relief had been obtained. The USA, Britain, Canada, France, Japan, Germany and Italy all agreed to forgive 100 percent of the bilateral debt owed to them by the poorest countries. Much debt relief, however, is bound up in complex procedures and prior agreements. Countries have to spend the money saved on debt repayment for health and human services that were cut under structural adjustment programs. And, although debt forgiveness was promised by the year 2000, only twenty countries had received some debt relief at that time. Jubilee 2000 did not disappear at the end of the millennium but, rather, a new organization was formed – Jubilee South.

Jubilee South describes itself as an increasingly cohesive coalition of Jubilee 2000 organizations from the South. 'We come from Africa, Latin America, the Caribbean, Asia and the Pacific, and are united in our desire to strengthen and move beyond present Jubilee Debt campaigns through the presence and projection of a Jubilee South vision and voice' (www.jubileesouth). A series of summit meetings is being held in the global South. At one of these, in Johannesburg in 1999, representatives from forty Southern countries rejected the

debt relief initiative of the IMF and World Bank (HIPC – see the next section), on the grounds that the first initiative gave very little debt relief, while the second, begun in 1999, is insufficient. Jubilee South rejects the debt reduction initiatives for other, broader reasons: they legitimize a debt that Jubilee South does not accept; the initiatives are covers for 'creditor relief'; they provide Southern countries with an opportunity to access more credit and accumulate greater debt; and the initiatives are merely modified versions of previous structural adjustment programs (South–South Summit Declaration 1999: 6). Jubilee South calls for Southern governments to repudiate their debts because their citizens have already paid in full in the forms of colonialism and slavery. Finally, Jubilee South demands that the North pay reparations to the South for the pain and suffering historically inflicted.

The fiftieth anniversary of the Bretton Woods conference of 1944 saw a coalition of NGOs, led by the International River Alliance, form an alliance called '50 Years is Enough.' The organization has its roots in earlier movements. The Nicaraguan Network, working with other 'solidarity groups' in opposition to US military intervention in Central America in the 1980s, began to focus more on economic oppression. Religious organizations following principles of Catholic Social Teaching, as with missionary groups such as the Maryknollers and other groups of nuns and priests, began to criticize the new global economy, linking it with poverty in the global South. These groups were major resources for 50 Years is Enough and Jubilee 2000. At the 1994 Madrid meetings of the IMF and World Bank, 50 Years is Enough tried to counter what it expected would otherwise be a positive media response to the birthday celebration. And when we looked at international media reports for 1994, we found few descriptions of demonstrations that took place in Madrid. Instead the media's version of the critical reactions to the conference focused on the coalition and their message – according to our count of a hundred or so newspaper articles written in 1994 dealing with the anniversary of Bretton Woods, a quarter referred to 50 Years is Enough. While the original intent was for the alliance to last for eighteen months, an initially small campaign composed of thirty-six NGOs in 1994 is now 'a coalition of 205 grassroots, faith-based, policy, women's, social- and economic-justice, youth, solidarity, labor, and development organizations dedicated to the profound transformation of the World Bank and the International Monetary Fund' (www.50years.org). In

the late 1990s, 50 Years is Enough produced educational materials, organized conferences for activists from around the world, and set up small-scale house meetings where five or six people discuss IMF and Word Bank policies and projects. As a result demonstrators showed an increasingly sophisticated knowledge even of arcane aspects of IMF and World Bank policy, while increased public awareness of Third World poverty issues and the AIDS crisis increases pressure on First World governments, and their representatives at the IMF.

Debt relief and anti-poverty discourse

We have to understand the IMF's final policy turn in the context of this mounting criticism. Moral outrage in the developed countries tended to focus on the issue of debt relief for poor countries. And as we have seen, conventional, and even conservative, opinion had, by the late 1980s, reached the conclusion that debt levels were unsustainable, and that some kind of organized relief was necessary. While the debt crisis of the 1980s mainly concerned middle-income Third World countries, such as Mexico, Brazil and Argentina, in the 1990s the main emphasis of IMF debt management shifted toward the lowest-income Third World countries. Loans to these very poor countries had been made mainly from official sources, as with government-to-government loans, export credits, official development assistance and loans from the IMF, the World Bank and regional development banks (Birdsall and Williamson 2002: 13–21). Responding to widespread concern expressed by developed countries, and in concert with the World Bank, the IMF began its Heavily Indebted Poor Countries (HIPCs) facility in 1996. The HIPC initiative was intended to manage, and even 'resolve' in the IMF's optimistic language, the debt problems of the most heavily indebted poor countries (originally forty-one countries, mostly in Africa) with a total debt of about $200 billion. In these countries debt service obligations consumed large parts of countries' export earnings. Half of the 615 million people in the current HIPC countries live on less than $1 a day. The HIPC initiative, in the IMF's words, 'seeks a permanent solution to these countries' debt problems by combining substantial debt reduction with policy reforms to raise long-term growth and reduce poverty' (IMF 2000). By adopting policies judged 'sound by the international community,' debt relief to the eventual extent of $60 billion would be granted. The IMF describes the various stages of a highly controlled, adjustment debt relief process as follows:

> Once countries have demonstrated their commitment to reduce macroeconomic imbalances and sustain growth-oriented policies, normally over a three-year period, they reach the 'decision point.' At this stage, an assessment of the needed assistance is made and appropriate relief is committed, including reductions in the stock of debt. The full stock-of-debt reduction is implemented following a further period of sound economic policies, at what is then called 'the completion point.' (ibid.)

As a mere seven countries qualified for assistance in the first three years of the facility's operation, the HIPC initiative was 'enhanced' in 1999 to provide interim debt relief, between the decision and completion points, which immediately reduced debt service costs. The enhanced facility joined debt relief more obviously with poverty reduction. To qualify for assistance under the HIPC initiative, or to get concessional loans from the IMF or the World Bank, countries have to prepare poverty reduction strategies with the participation of members of civil society. This was a new approach for the IMF and its description is worth quoting at length:

> Nationally-owned poverty reduction strategies are at the heart of the new approach. Lending from the IMF (and IDA, the World Bank's concessional window) is being framed around a comprehensive Poverty Reduction Strategy Paper (PRSP) prepared by the borrowing country. The country and its people take the lead in preparing PRSPs. They are prepared by the government, based on a process involving the active participation of civil society, NGOs, donors, and international institutions. Locally-produced PRSPs are expected to generate fresh ideas about strategies and measures needed to reach shared growth and poverty reduction goals, and to help develop a sense of ownership and national commitment to reaching those objectives. The PRSP can then be endorsed by the Boards of the IMF and World Bank as the basis for the institutions' concessional loans and for relief under the enhanced HIPC Initiative. Donors, including the IMF and World Bank, provide advice and expertise. But the strategy and the policies should emerge out of national debates in which the voices of the poor, especially, are heard. Given the year or more needed to prepare full PRSPs, and with dozens of poor countries needing immediate concessional assistance from the IMF and World Bank, waiting for countries to complete PRSPs would have interrupted the flow of concessional loans. Consequently, countries

> are encouraged to prepare an Interim PRSP (IPRSP), drawing on existing data, plans, and policies, to guide their efforts during the PRSP preparation phase. (ibid.)

In the year after enhancement, $10 billion of debt relief was committed for ten countries, while by 2001, twenty-two countries, eighteen being in Africa, had qualified for debt relief under the HIPC initiative. This is supposed eventually to reduce these countries' foreign debt by two-thirds. Nevertheless, developing country debt (including that of middle-income countries) continued to rise from $500 billion in 1980 to $1 trillion in 1985 and around $2 trillion in 2000. What the IMF calls the forty-one 'HIPC countries' (the lowest-income countries) had an increase in total indebtedness from $60 billion in 1980, to $105 billion in 1985, $190 billion in 1990, and $205 billion in 2000 (ibid.).

As a result of mounting criticism, the IMF engaged in a series of internal evaluations of its operations and policies, and in 2001 set up a permanent Independent Evaluation Office (IEO) with the purpose of 'improving the IMF's effectiveness by enhancing the learning culture of the IMF and enabling it to better absorb lessons for improvements in its future work.' Even more remarkably, external evaluations of IMF procedures and policies were announced following an Executive Board meeting in 1996. In 1998 an external evaluation of the IMF's Enhanced Structural Adjustment Facility was conducted by four 'independent experts,' academic economists from the Harvard Institute for International Development, Oxford University and the Free University of Amsterdam. They used a case study method looking at IMF documents but also visiting eight countries in Africa, Asia and Latin America, where they talked with government officials, ministers and staff, NGOs, workers, trade union leaders and workers about the ownership, governance and social impacts of structural adjustment programs. The evaluators found a general recognition of the need for reforms of the kind proposed by the IMF, but concern that programs should be anchored in national consensus and ownership as a way of ensuring their sustainability, and concern too about loss of control over the setting of the policy agenda and the negotiation process. They recommended that Economic Management Teams be formed that would include not just the minister of finance in the country affected, but other cabinet members, together with the holding of national conferences where the aims, objectives and methods of the programs

would be openly debated among a large cross-section of people, including civil society organizations. In terms of social impacts, the evaluators found that adjustment typically involved huge changes in society, including massive changes in relative prices and redistributions of income, together with widespread suffering for poor people. What they called 'distributional impacts' could be identified before implementation of programs began. So they recommended explicit analysis of the distributional impacts of programs, something that had not occurred sufficiently, and the monitoring of income changes, using expertise from the World Bank in the absence of IMF proficiency in such matters. Finally, they thought that the structural adjustment facility should remain after countries had been stabilized as a signal that an economic environment now existed that investors could take seriously. The evaluators found a negative public perception of the IMF in many countries they visited which might deter governments from dealing with the Fund because of the political costs involved. They thought it important that the IMF should 'interact with people more and better in these countries so that they understand what the Fund does' (IMF 1998b). The IMF Executive Board said that it welcomed these proposals.

As a result of these and other pressures, in 1999 outgoing director Michel Camdessus issued a statement saying that member countries had endorsed 'a clear mandate for the Fund to integrate the objectives of poverty reduction and growth more fully into its operations.' The IMF changed the name of the Enhanced Structural Adjustment Facility (ESAF) to the Poverty Reduction and Growth Facility (PRGF). The change of name was intended to signal that IMF lending for poor countries would now be embedded in a broader development agenda: Poverty Reduction Strategies. This facility, available to eighty low-income countries, provides ten-year loans at an annual interest rate of 0.5 percent. The IMF says that the new version essentially does two things: it immerses poverty reduction into structural adjustment; and it aims at broader participation and greater country ownership of the economic programs that accompany loans. Under the PRGF conditionality is supposed to be more selective, with greater emphasis on the social impacts of policies and more emphasis on 'governance' – this includes accountability for public resource management, budgets that are more pro-poor and pro-growth, and increased flexibility for government budget targets. Uganda's Poverty Eradication Action Plan, begun in 1997 (IMF 1997), described by the IMF as transforming the

country into 'a modern economy in which people in all sectors can participate in economic growth,' is the model case.

Do we therefore have a new IMF, which has learned from its many critics and has changed its position from neoliberal structural adjustment to poverty reduction using policies suggested by civil society organizations during genuine national debates? The answer depends on whether and how the new model is realized in practice rather than in IMF press releases. The IMF finds in general that 'PRGF programs have had a promising beginning' (IMF 2002c). A dialog arranged by *Finance & Development*, the IMF in-house journal, asked five people involved in the preparation of Bolivia's poverty reduction strategy paper for their views on what worked and what did not. The minister and official most concerned, together with the IMF representative in Bolivia, thought the strategy had increased public participation in economic policy formation. But the one observer independent of governments or the IMF asked to comment by the journal, Juan Carlos Núñez from the Episcopal Pastoral Social Commission, said that the HIPC initiative provided a window of opportunity for dialog and debate by civil society, in which the main actors – the very poor – could make themselves heard and make proposals regarding the preparation of the PRSP. He added, however:

> It was based on three agendas: social, economic, and political. The poor were able to participate to some degree in the social agenda, but not in the other two, even though a real struggle against poverty must include certain changes in the political and economic structures. The methodology of the dialogue was controlled and closed, and did not allow for macroeconomic issues to be addressed. The players invited – especially in the municipal roundtables – were not the very poor; in fact, they belonged to the political system. The main political leadership did not attend and the announced political summit was not held. (IMF 2002d)

Hence there was a difference of opinion, even within IMF circles (you can almost hear the editors of *Finance & Development* saying 'oops!').

Outside the IMF, a number of studies critically examined the new initiatives. An extensive investigation by the (London-based) World Development Movement of four PRSPs and twelve interim documents, which drew as well on comments made by civil society groups from many developing countries, finds civil society groups unsatisfied with

the extent of public involvement in drawing up the strategy papers. The report says that the policy content of the new strategies does not constitute a major change from the past. Although the rhetoric may be poverty-focused, the actual policies do not have clear poverty-reducing consequences. The strategies still focus on economic growth without, for the most part, addressing how this growth is redistributed to the poor. Indeed, the core macroeconomic elements have changed little from the old structural adjustment programs, with continued adherence to privatization, liberalization and a reduced role for the state (Marshall with Woodroffe 2001).

Likewise, a detailed investigation of PRSPs in Cameroon, Honduras, Nicaragua and Mozambique (Knoke and Morazan 2002) finds them structured by the standard macroeconomic conditionality in which economic benefits are supposed to trickle down to the poor. Many of the structural adjustment conditionalities, as with privatization, liberalization of trade and fiscal (tax) policy, contradict the poverty-reducing aspects of the programs. Also the version of participation in constructing PRSPs laid out by the IMF does not consider the different conceptions of policy held by different power interests, some of which, the most powerful, have more opportunity to impose their views. Hence the PRSP has produced a process of consultation rather than real participation.

Civil society groups in Sri Lanka rejected that country's PRSP in 2003 because, as stated by the Alliance for the Protection of Natural Resources and Human Rights, the report was drafted without consultation with civil society and differed little from previous IMF recommendations. The Alliance consists of more than a hundred groups, including peasants and fisheries workers, trade unions, religious organizations and people threatened with displacement. The government unveiled its PRSP at a 'Development Forum,' saying it had been prepared after comprehensive consultation. Members of the Alliance tried to find out which groups had been consulted, with no success. Trade unions, for example, were not made aware of the PRSP until the ILO held a workshop about it. The Sri Lankan government attempted to pass a series of laws reflecting the priorities highlighted in the PRSP and aiming at securing new IMF and Bank loans but was resisted. As a report by Focus on the Global South argued: 'poverty is used as window-dressing to peddle more or less the same adjustment programs to low income countries that led them into a state of chronic economic crisis to begin with' (BWP

Update 33). Or as a staff report at the IMF and World Bank put it in optimistic Fundspeak: 'Low income countries are taking charge of their own future and recognizing that there can be no substitute for sound policies and their own efforts. The prospects for sustained, strong growth – which is indispensable for reducing poverty – requires investment, not least in human capital and infrastructure, as well as the right macroeconomic and structural policies, good governance, and healthy institutions. Countries therefore need to act to build an improved investment climate for private enterprise' (Staff of the World Bank and IMF 2002). That is, taking charge of one's own future through the PRSP process means improving the investment climate for private enterprise.

And a case study of Uganda, important because this country is regarded by the IMF as the leading, successful case of participatory governance, transparency and economic growth, finds that the actual policies on which loans were conditioned 'were determined by the IMF and World Bank representatives in consultation with small teams within the Ministry of Finance and the Central Bank [of Uganda]' (Nyamugasira and Rowden 2002: 5). The new programs have not learned from previous criticisms within the IMF and the World Bank of the failures of structural adjustment. The Ugandan case, the authors of the report say, supports growing criticism that the IMF and the World Bank have simply repackaged the structural adjustment policies of the past into the new poverty-reduction program.

Evaluating the IMF

The power of the IMF comes from the direct and indirect control it maintains over the granting of loans to governments experiencing crises in balances of payments and having difficulty making interest and principal payments on foreign debts. Power is exercised through the conditions specified in stabilization and adjustment programs that are imposed on the granting of desperately needed loans. At least since the mid-1970s, conditionality has been based on an understanding of economies based on a version of neoclassical economics that we refer to as neoliberal – that is, a revival of nineteenth-century liberalism that counters Keynesian interventionism by stressing privatization, deregulation and other anti-state policy areas. According to the official historian of the IMF, James M. Boughton (2002), the increasingly free-market nature of the conditionalities attached to loans is part of a 'silent revolution' in economic policy-making: a

subtle but ultimately dramatic drift toward policies that were 'more cooperative, outward oriented, and market friendly than before.' In this the official historian expands on remarks made about a 'silent revolution' by Michel Camdessus, managing director of the IMF. Speaking at the Annual Meetings of the Boards of Governors of the IMF and the World Bank in 1989, Camdessus (1989) said that countries were finally making the 'painful decision' to 'strengthen' their economic policies and implement growth-oriented adjustment programs with financial support from the IMF, after earlier resisting its advice, or changing their policies only as much as was necessary to qualify for financial assistance. These countries were now willingly embracing market- and export-oriented policies. Long-standing ideological divisions between those favoring private enterprise and those favoring a primary development role for state enterprise, and between those favoring open and unified market pricing and those insisting on widespread state controls, were gradually being resolved in favor of economic liberals in many parts of the world. In particular, he thought, economic philosophies and prevailing attitudes toward policy-making changed dramatically during the 1980s. In the new classical economics that came to dominate economic opinion in the 1980s, the government is expected to play only an indirect role in guiding the economy by creating the preconditions for sustainable growth, but not to assume direct responsibility for ensuring full employment or high rates of economic growth. Few governments would have adopted that position in the 1970s, but many did by the end of the 1980s. So – a 'silent revolution' in which the superiority of free enterprise, IMF style, was inevitably recognized as sound, good sense by governments all over the world.

On what is this 'recognition' based? And who does the 'recognizing'? In conventional economic reasoning arguments for the general acceptance of policies, together with their political-economic theoretical bases, are conventionally made on functional-realist grounds – that these policies work well in terms of producing results, usually high rates of economic growth, but also other macroeconomic variables, such as low inflation rates or surpluses in balances of payments. Any claim that policy-making merely follows the best of economic science as proved by empirical evidence is vulnerable to counter-interpretations of these data. So we might look at studies that have indeed investigated the effects of IMF policies on national economies.

Here we remain within conventional, and even conservative, investi-

gation, including some work from within the IMF itself. A survey by Mohsin Khan (1990), using sixteen studies of how IMF-supported programs affected the macroeconomic characteristics of countries subjected to conditionality, reached the following conclusion: seven out of sixteen studies showed positive effects on the balance of payments, four showed no effect, three showed a negative effect, and two drew no conclusions; five showed positive effects on the current account, five showed no effect, two showed negative effects, and four drew no conclusions; two drew positive effects on inflation, four showed no effects, and ten showed negative effects; four showed positive effects on growth, five showed no effects, and seven showed negative effects. In general, Khan's study shows that IMF conditionality may have a positive effect on balances of payments and current accounts, its immediate targets, but tends to have negative effects on inflation and growth, aspects of the economy having longer-term effects on populations. As Khan (ibid.: 222) said: 'On the basis of existing studies, one certainly cannot say whether the adoption of programs supported by the Fund led to improvement in inflation and growth performance. In fact it is often found that programs are associated with a rise in inflation and a fall in the growth rate.'

In an evaluation from the conservative Heritage Foundation, Johnson and Schaefer (1999: 54) concluded that 'Forty-eight of eighty-nine less-developed countries that received IMF money between 1965 and 1995 are no better off economically than they were before; thirty-two of these forty-eight are poorer than before; and fourteen of these thirty-two countries have economies that are at least 15 percent smaller than they were before their first IMF loan or purchase.' They find that lending by the IMF creates more long-term dependency (on more and more loans) than it gives short-term assistance, that it has failed to improve the economies of less developed countries, and that in many cases it has hurt them.

A major study by the United Nations Conference on Trade and Development (UNCTAD) of forty-eight least developed countries (LDCs) found that the IMF's Structural Adjustment Facility, begun in 1986, and extended in 1987 into the ESAF, has become the main new determinant of national economic policy in poor countries:

> The importance of ESAF loans stemmed less from the amount of resources provided than from the access which an IMF agreement provided to other official resources. Without an IMF ESAF

> agreement, it was impossible to have debt rescheduling through the Paris Club. Moreover, an ESAF program was often a precondition for grants and loans by bilateral donors, and financing from other international financial institutions in low income countries. ESAF-supported programs thus shaped policy change in LDCs, and also acted as the framework for obtaining concessional finance and debt relief in the 1990s. (UNCTAD 2000: 101)

As a result, developing countries go through repeated IMF structural adjustments that cause profound policy changes in terms of deregulation of prices and markets, liberalization of trade, and reform of foreign currency regimes and interest rates. What, then, are the results for the countries concerned? According to the UNCTAD study (ibid.: 108): 'The average real GDP per capita was declining by 1.4 [percent] per annum in the three years before the programs were initiated, was stagnant in the three years after, and then declined by 1.1 percent in the next three years.' At the same time, indebtedness grew to unsustainable levels. UNCTAD (ibid.: 110) concludes: 'the efficacy of the economic reforms, on which so many lives and livelihoods now hang is, and must remain, an act of faith.'

Questioning faith

For us this means that the IMF adheres to neoliberal economic thought in the production of policy prescriptions on grounds of faith, rather than the foundation of proven science. The main question becomes why and how a certain belief was adopted, and why it continues to be accepted as a matter of faith. And this question raises issues of power, interest, hegemony and discourse elaborated in Chapter 1. Our historical survey of the IMF indicates that the USA, working mainly through the Treasury Department, has always had a dominant, but not absolutely controlling, interest in the IMF – in terms of personnel and financing clearly, but also in terms of pressure on the formation of policy. In the mid-1970s, and again in the early to mid-1980s, the USA exerted its dominance with a particular intensity that included threats to withdraw financial support at times when the IMF was stretched thin. US dominance came to be expressed in a revised stance taken by a changing IMF. Loans and debt forgiveness were made conditional on a country's adoption of what quickly became a standard set of policies. These policies were based in a political view of how 'successful' economies function, especially (following

the Baker Plan) how economies grow. And this political-economic stance was vigorously propagated by a right-turning Republican Party, symbolized by the election of Ronald Reagan.

At the same time, economic conditions during the 1970s, especially the combination of stagnation (low growth rates and high unemployment) with inflation (a sustained increase in price levels that reduces the purchasing power of a country's currency), or, as it was called, 'stagflation,' was interpreted by many conventional (neoclassical) economists as a failure of Keynesian economic management. Economists who had long called for a return to the classical and neoclassical roots of economic thought as the truly scientific basis for policy-making were again taken seriously – within global economic governance institutions as well as in academia and state bureaucracies.

Thus a convergence of political economic perspectives took place linking external sources of rightist influence, coming particularly from the USA, and expressed well in Reagan's phrase 'the magic of the marketplace,' with the internal neoclassical 'scientific' economic culture of the IMF, which established the core position taken by the institution ever since – essentially one of neoliberalism. Yet the main tenet of neoliberal economics is the efficacy of the market – the *unregulated* market at the Hayekian–Friedmanist extreme of this style of thought. Following this dictate to the bitter end would entail the demise of the IMF, as indeed Milton Friedman (1999) advocated: 'We need government, both within the nations and internationally, to get out of the way and let the market work.' The IMF therefore had to synthesize aspects of Keynesian regulation with neoliberal demands for deregulation. The resolution of this contradiction was for global governance institutions to oversee the deregulation of national economies. This involved a shift upward in the locus of power to the global institutional level, within geo-economic power relations that maintained overall US control. Thus we would describe the IMF as an institution that believes, to the point of abiding faith, in a new kind of global neoliberalism, which preserves aspects of Keynesianism in terms of the need for institutional regulation of the world economy, as long as the IMF does it, but which also prescribes deregulation at the national level, especially in Third World countries, which become IMF dependencies. As we have seen, the policy positions that derive from this stance are prescribed regardless of the loss of thousands of lives in anti-austerity demonstrations and regardless of highly

informed criticism. So the IMF speaks in terms of 'sequencing and timing corrections' but never in terms of fundamental change in the way it conceptualizes model economies. When forced by public pressure to consider, at last, the opinions of those affected by its policies, it allocates bits of 'social programming' to selected, safe national actors as a front behind which it can carry on exactly as before. And it takes the desperate submission of Third World governments to its policy format as evidence that they at last recognize the truthful inevitability of the IMF position (the 'silent revolution'). The essence of hegemony is self-delusion!

The bankers' view of the world

Let us revisit some key events in the last two decades of governance practice from a particular, interested point of view – the notion of a 'banker's perspective' – which will become more apparent in the following chapters and is theorized in Chapter 6. In forming our conclusions, we looked at issues of a trade magazine, *The American Banker*, between 1980 and 2002, which represents the private banking perspective. We found that during the Latin American debt crisis of the 1980s, and later in the Asian crisis of the 1990s, bankers frequently claimed that the media were exaggerating a simple problem of liquidity into one of wholesale national solvency. Moreover, they thought, crises were more of a problem of regulatory structures – both in the countries undergoing crisis and in the home countries of the lending banks, especially the USA – than a problem of the basic structure of the global economy. Bankers were also convinced that solutions to financial crisis came from collective efforts by international agencies, governments and central banks but, most importantly, from the concerted efforts of the 'financial community.' Their collective capability for dealing with crises was maintained by banking associations and institutions, together with 'think tanks' that represented banking interests and provided the banking community with insights into future investment. Of those, the institutions that were most active during the 1980s include the Institute of International Finance, a 'global association of financial institutions' established in 1983 in Washington, DC; the American Bankers' Association; the Bankers' Association for Foreign Trade, now the Bankers' Association for Finance and Trade; the Institute of International Bankers; the Group of Thirty, a New York-based think tank established in 1978; the Institute of International Monetary Affairs, a Tokyo-based think

tank; and the Institute for International Economics, Washington, DC. These institutions, usually composed of banking and other financial organizations, engage in lobbying legislators, regulators and policy-makers, and play important advocacy roles in the interests of the banking community. They also organize periodic conferences, and they provide members of the financial services industry with information on markets and on financial technologies. These research institutions, well funded by private sources, organize forums and establish study groups and committees to present the banking industry with information on international economic and financial issues that provide the financial industry with a 'sounder basis' for policy-making advocacy and their own financial decisions. Most of these institutions are based in Washington, DC, and New York. Many have branches in other major financial centers.

A case in point is the Institute of International Finance (IIF), established in 1983, in the midst of the Latin American debt crisis. This institute had the sole purpose of gathering and improving information on the economic circumstances of borrowing countries that would enable bankers to make sound investments based on proper country risk assessment. Based in Washington, the IIF includes prominent members from the financial community, the biggest banks, securities firms and insurance companies that invest heavily in foreign markets, and is chaired by senior members of major Wall Street banking institutions. The IIF organizes meetings and conferences where bankers negotiate among themselves, and with governments and international agencies, about solutions to investment problems. The IIF represents banks with foreign loans to the US government and to the global governance institutions.

Bankers tend to represent their interests as a group. Senior members of the bigger banks take the lead and do the intermediary work for what can sometimes amount to amalgamations of hundreds of banks. The solution to the debt crisis of the 1980s was seen by bankers, among others, as residing in the re-establishment of the creditworthiness of debtor countries. The crisis itself was seen as a liquidity problem, not a solvency problem, meaning a short-term shortage of money to pay off debts, rather than a lack of capability to service this debt in the long run. Hence, the solution to the debt crisis rested on re-establishing creditworthiness – that is, improving the 'investment climate' in debtor countries, by means of adjustment and restructuring programs implemented under the auspices of the

IMF. This was important for future lending. Instead of forgiving loans and easing interest rates on debts, bankers believed that the solution to the debt crisis resided in creating more debt. Bankers recognized the irony of such a solution, of 'throwing good money after bad,' in their words, to solve the debt crisis. They thought, however, that only by rejuvenating capital flows into debtor countries could these countries grow so that they could service their debts. They also thought that the real growth of developing countries was dependent on growth in the developed countries, for the latter provide markets necessary for the Third World exports needed to increase their 'hard currency' reserves and hence service their debts.

For the bankers, the IMF plays a crucial role in at least three ways. First, the main function ascribed to the Fund is to maintain 'reasonable flows of liquidity.' For bankers, the IMF should not play the role of long-term lender. The Fund's financial services were seen more, in the words of Jacques de Larosiere, IMF managing director at the time, as a 'catalyst to unlock access to private capital markets.' IMF resources should not be frozen in long-term loans, but should be used as stand-by emergency funds, to maintain the flow of private capital into Third World countries. The Fund's austerity measures were directly related to this flow, as adjustment programs were seen as the necessary factor in establishing the creditworthiness of debtor countries. Bankers tended, however, to be critical of these austerity measures when they became too severe, for they then inhibited the development of indebted countries.

Second, bankers see the IMF as a main source of systematic and centralized information. As an international governance institution, the IMF has a more 'state-like relationship' with member countries than private banks can possibly have, and can get higher-quality information from them. Bankers complain that the IMF does not release all the information it has. The IMF usually responds to such criticism by saying that it publicly releases most of the information it gathers.

Third, bankers think that the IMF can play the role of central coordinator of international financial policies and stabilizing agent in international financial markets. Yet bankers also take a strong position against regulations and regulators, or any other kind of state or quasi-state intermediary, for that matter. Often they would prefer to do away altogether with the IMF and negotiate directly with Third World governments, as well as finance and monitor debt through

direct agreements with states. Bankers are often critical of the IMF for being inefficient, and are sometimes critical of their governments' intervention in foreign lending as being counterproductive. Their main criticism is directed against the rigidity of state regulations dealing with accounting and conditions for foreign lending. This view is shared by American and European bankers alike. The main point they contest is the requirement for maintaining reserves against foreign loans. They also contest the rating of debtor countries that the US government uses in determining reserve funds.

Bankers see any regulation that restricts capital flows as an obstacle to their business. Their ultimate aim is to keep capital flowing as much as possible. This is why they are not as concerned with the immediate repayment of debts as much as with potential repayment in the future. They welcome any suggestion for an increase in their lending as long as there is some guarantee that part of their loans will be repaid in the future. This makes them more interested in the long-term creditworthiness of debtor countries than in their immediate ability to pay off debt. From this perspective, the rescheduling of debts can be seen as a transformation of short-term debt into long-term bonds. Some analysts see rescheduling as 'near default' or 'default by attrition' – that is, default in everything but name. A good investment banker, however, knows that the transformation of short-term into long-term debt is a transformation of commercial loans into investment loans, and of a commercial client into a chronic borrower. Bankers would be more willing to extend additional loans to pay interest on original loans than to ease debt conditions or forgive certain loans – but, as we have seen, they finally acquiesced to debt forgiveness as a concession to the hard facts of overextension. They regard debt forgiveness as a cause of further problems, however, more than as a solution to current problems.

Banks are willing to trade loans among themselves and with Third World debtor countries, or to swap loans with those countries for equity shares in state-owned firms or natural resource industries. Loans are traded in 'secondary markets' for a fraction of their real value. Bankers trade loans to increase the geographic diversity of their investments – that is, to decrease the national concentration of their loans. This is in line with an attempt to diversify risks and a preference for dealing with loans on a case-by-case basis. They do not see regional solutions as viable. Instead, each case should be dealt with differently, according to the capacities of the country in question.

Therefore, another criticism directed against the IMF is that austerity measures cannot work in the long run, nor can they work on the scale of whole regions, such as Latin America. This is in line with their view that the IMF is not a long-term lender, nor a development agency. Nevertheless, in the mid-1980s the case-by-case approach was seen to be ineffective, and the Baker Plan proposed putting an end to Third World debt crisis in a way that deviated from previous strategies, but nevertheless invited private banks to extend more loans. The plan was first met by criticisms from bankers as being 'purely conceptual,' offering no guarantees on future loans, and lacking detailed procedures. It took two meetings between the banking community and James Baker 'behind closed doors,' and a final meeting of bankers, all under the auspices of the IIF, before they announced strong support for the Baker Plan. The Baker Plan also marked a general shift in policy, from austerity measures to development programs. This meant more involvement, and a stronger role, for the World Bank in the debt crisis. This was also accompanied by a new rhetoric on development targets, strategies for alleviating poverty and inducing growth in Third World economies. For bankers, this meant a new form of partnership with the World Bank – a joint loan project was proposed in the mid-1980s in which the Bank guaranteed repayments to commercial banks, and in which the Bank participated directly in the commercial part of a co-financed loan. On the assumption that no country has ever defaulted on a World Bank loan, an increase in Bank lending was seen as a catalyst for private bank lending.

These rapid shifts in emphasis bring a few general issues to the center of our concerns. These are the relation between the financial system and economic development, and the role of global institutions and private banks in encouraging economic development. It is quite evident from bankers' emphasis on financial reform in debtor countries, and their belief that real economic growth is the only way debtor countries can service their debts and repay their loans, that they think the financial structure and the quality of financial services play a decisive role in making real growth possible, and that, reciprocally and mutually, investment in production and in long-term development projects is crucial to a country's financial status, its creditworthiness with regard to banks and, by extrapolation, to the international financial system and its stability. The IMF and the World Bank were established in 1944 to play this dual role of stabilizing the global financial structure and encouraging economic development.

The question remains, however, how to bring financial stability, how to instigate economic development, what kind of development, and toward what ends? From our investigation of the financial crises of the 1980s, 1990s and 2000s, banks, bankers and their associations were more than financial intermediaries between capital accumulations in developed countries and the global governance institutions lending to central banks in developing countries. Investment banks in particular provided the expertise, contacts and conditions of trust necessary for transferring money among institutions and among countries. Necessarily they carry a conservative attitude toward moneylending – 'necessarily' because originally banks lent old money from rich, conservative people, and 'necessarily' because, in terms of practicality, they want to ensure that eventually the money they lend will be paid back with interest. We find the connections between investment banks and governance institutions frequently alluded to in a cynical way by those in the loop, particularly in the *Wall Street Journal*. How these connections operate, and how they might be theorized, are issues we will try to illuminate further in the coming chapters … for this gets to the crux of the matter.

Decline and fall of the IMF?

As this chapter has shown, the IMF has been subjected to high and increasing levels of well-founded criticism. Third World countries have long said that they resent being told what to do with their economies by the IMF. During the East Asian crisis in 1997, the IMF laid down conditions that governments had to meet in order to access $120 billion in foreign funds. As financial contagion spread to Russia and Brazil, the IMF followed, with multibillion-dollar loans. But those days are over. After their experience with the Fund in 1997/98, the Asian countries began accumulating huge international foreign exchange reserves, in part so they would not have to rely on the IMF again. The case of Argentina in 2003 showed that a country under dire stress could stand up to the IMF, and not only live to tell the tale, but even launch an economic recovery. The IMF is still influential in poorer regions (for example, sub-Saharan Africa) where countries seek debt relief, and help in paying higher food and fuel prices with the global inflation of 2007 onward. But its influence in middle-income countries has plummeted. The Fund is a 'shadow of its former self' (Weisbrot 2005).

The most outspoken critics of the IMF are Latin American governments and social movements. In 2007 Venezuela's president, Hugo

Chavez, called the IMF and the World Bank ' tools of the empire … [that] serve the interests of the North,' and severed ties with both institutions to pursue radical political reform and an economic 'third way.' Ecuador completed an early repayment of the country's IMF debt, stating: 'We don't want to hear anything more from that international bureaucracy.' Ecuador then ejected the IMF's resident representative out of the offices of the central bank, and the Fund withdrew its representative from Ecuador entirely. Nicaragua's president, Daniel Ortega, requested a new PRGF arrangement with the Fund, but added that involvement with the international institutions was unpopular, saying: 'It is a blessing to be free of the Fund, and for the Fund it will be a relief to rid itself of a government that defends the interests of the poor.' He stated that he planned to end Nicaragua's borrowing from the Fund within five years. Russian president Vladimir Putin said that global institutions like the IMF and the WTO should play a much lesser role and proposed a 'new architecture of international economic relations based on trust and mutually beneficial integration.' China has rejected the IMF's advice on its exchange rate policy. Indonesia, recently the second-largest debtor to the Fund, with nearly $8 billion outstanding, repaid its debt early despite a devastating earthquake hitting the country fifteen months after a tsunami struck at the end of 2004. Macedonia, Bulgaria and the Philippines also tried to repay loans earlier than necessary. The Fund's $10 billion loan agreement with Turkey, often termed 'the IMF's last major customer,' expired in 2008. This left the Fund with less than $20 billion in outstanding credits, its lowest in twenty years, and down from $100 billion three years previously (BWP Update 56). Richard Webb and Devesh Kapur (2006: 2) find: 'The de facto exit of its clientele, driven by the combination of high political costs associated with Fund borrowing and growing availability of alternatives, now poses an unprecedented challenge for the Fund, in particular on its income.'

As poor countries cleared their debts, the IMF suggested in 2005 that they might still require 'ongoing IMF advice, monitoring and endorsement of their economic policies – what is called policy support and signaling.' This 'signaling' refers to information the Fund provides about countries' economic performance and prospects that is used by private creditors including: banks and bond-holders, interested in the repayment prospects of loans; official donors and creditors interested in reassurance about the countries they are supporting; and the public at large. In low-income countries, such signals previously have been

sent mainly in the context of the IMF's Poverty Reduction and Growth Facility and the related Poverty Reduction Strategy process. Now a new facility, the Policy Support Instrument (PSI), has been initiated, in the IMF's words to: (i) promote a close policy dialog between the IMF and a member country; (ii) provide more frequent Fund assessments of a member's economic and financial policies than is available through the regular consultation process, known as 'surveillance'; and (iii) deliver clear signals on the strength of these policies. According to the IMF, the PSI is voluntary, demand-driven, and intended to be supported by strong country ownership. Therefore, it will be available only upon the request of a member (IMF 2007). Only five countries have so far agreed to the new surveillance, which amounts to the IMF acting as a kind of international credit rating agency, telling other investors whether or not to lend. Simply put: IMF advice is not worth the price of continued surveillance.

Buttressing these rejections of the current institutional framework, there are several attempts under way at building regional alternatives. In 2007 the economic ministers of Argentina, Venezuela, Bolivia, Ecuador, Paraguay and Brazil agreed to set up a Bank of the South. Venezuela's President Chavez had mentioned this in early 2006, as part of a set of financial institutions that would provide an alternative to the World Bank and IMF – Venezuela will move 10 percent of its reserves into the new bank. The Bank of the South maintains equal voting rights for each of its member states. And at a Kyoto meeting of the ten members of the Association of Southeast Asian Nations (ASEAN) with nearby South Korea, China and Japan (ASEAN+3), the countries of the region agreed to an $80 billion regional currency swap arrangement as a step toward an eventual Asian Monetary Fund. The 'Chiang Mai initiative' began as a response to the 1997/98 Asian financial crisis. Under the initiative, central banks from the countries swap foreign exchange reserves to combat speculative attacks on their currencies.

From a position of dominance in the pre-Asian-crisis global economy, the power of the IMF has been reduced by failed crisis management, the rejection of major policy initiatives, countries paying up as quickly as possible and distancing themselves, its credibility and legitimacy being questioned, and other symptoms of decline. The financial crisis of 2007/08 might seem like the perfect time for the IMF to 'rise like a Phoenix,' but the Fund played a minor role. This was due to widespread criticism of its earlier performance during

the East Asian crisis. Indeed, even conventional critics are basically saying the IMF is useless in just *predicting* crises. For example, a report by the US Government Accounting Office (GAO) on the IMF's new 'vulnerability framework,' constructed after the Asian crisis, comments that one of its key parts (the World Economic Outlook) has a 'poor track record in forecasting recessions, including those directly associated with a financial crisis. From 1991–2001, out of 134 recessions that occurred in developing countries, the WEO correctly forecast only 15, while actually predicting an increase in GDP in the other 119 recessions, including major ones leading to the Mexican and Asian crises' (BWP Update 35). As its lending activities shrank, the IMF lost income and faced $100 million in cuts from its previous $900 million budget. The Fund tried to sell some of its 103 million ounces of gold bullion reserves to set up an investment fund to generate revenue, but has to get US and congressional approval for selling the gold, with many other member countries resisting sales because they regard the gold as belonging to them. Under pressure from its membership the IMF's incoming (2007) managing director, Dominique Strauss-Kahn, was forced to cut the IMF's budget. So the IMF itself went through structural adjustment, beginning as usual with firing workers or inducing them to leave. In this case, voluntary retirement packages were enough to convince 590 Fund staff members, including six department directors, to leave – the IMF had planned to reduce staff levels only by 380. The IMF responds to this new crisis as usual, through 'streamlining' and 'thorough-going internal reform.' This includes reform of the voting structure. At the 2006 Annual Meetings in Singapore, ad hoc increases in quotas were agreed for China, Korea, Mexico and Turkey. The IMF says that further reforms will eventually increase the voting shares of two-thirds of the 185 member countries, and enhance the voice and participation of low-income countries through a tripling of basic votes. But the total increase for developing countries is only 1.6 percentage points, meaning that rich countries, representing about 15 percent of the membership of the IMF, will continue to wield nearly 60 percent of the voting rights. The idea is to 'Refocus the IMF' on current global problems, such as rising food and fuel prices and the financial market crisis of 2007/08. Thus far, however, beyond 'monitoring' and 'advising,' the IMF has not been able to reassert itself. The question is, will it survive as a main actor in a changing global governance structure?

FOUR
The World Bank

At Bretton Woods, discussion of the formation of international organizations dwelt almost exclusively on the IMF. The IBRD was a mere afterthought. What little exchange there was concerning the IBRD centered on its possible role in the post-war reconstruction of Europe. On the few occasions that poor countries were – briefly – mentioned, issues such as poverty never came up. Indeed, such were the preoccupations of the Europeans and Americans at the time that labels such as 'poor countries,' or the more critical term 'underdeveloped counties,' did not exist as functional geographical categories – countries outside Europe and North America were referred to as 'the colonies.' Now, however, the World Bank operates as a development agency with a mission statement that says 'our dream is a world without poverty.' For this the World Bank group, as the conglomerate calls itself, lends US$17 billion a year to client countries. What is more, it sets the conditions under which further billions, in loans and grants, flow to Third World and post-communist countries. Taken together, these two interventions – direct loans and the setting of policy conditions – make the World Bank the most important development institution in the world. 'The World Bank,' as one commentator wittily puts it, 'is to economic development theology what the papacy is to Catholicism, complete with yearly encyclicals' (Holland 1998: 5 – 'yearly encyclicals' refers to the annual *World Development Report*s). Between afterthought and dream lies a long and contorted history that saw the Bank grow from very little to a mighty institution.

Structure and purpose

The World Bank group actually consists of five specialized institutions:

1 The International Bank for Reconstruction and Development (IBRD) makes development loans, guarantees loans and offers analytical and advisory services. The IBRD borrows at low

interest rates by selling bonds in private capital markets in First World countries and makes near-market interest loans to 'creditworthy countries' in the Third World and elsewhere. It has made about $360 billion in loans over its lifetime and currently lends $10.5 billion a year for some ninety new operations in thirty-six countries.

2 The International Development Association (IDA) gives loans to countries that are 'usually not creditworthy' in international financial markets. IDA loans carry no interest, but a 0.75 percent administrative charge is made annually. The IDA, averaging $6 billion a year in lending to the poorest countries, is funded from member governments' national budgets.

3 The International Finance Corporation (IFC) is the largest multilateral source of loan and equity financing for private sector projects in the developing world.

4 The Multilateral Investment Guarantee Agency (MIGA) provides investment insurance.

5 The International Center for Settlement of Investment Disputes (ICSID) facilitates the settlement of investment disputes between governments and foreign investors (World Bank website).

The terms 'World Bank' and 'the Bank' refer properly only to the IBRD and the IDA, and we will basically restrict our attention to these. The president of the World Bank at the moment is Robert B. Zoellick, former US Trade Representative. Its headquarters is in Washington, DC, and it has the same membership as the IMF – 185 countries. Its staff numbers 8,000 employees in Washington and 2,000 in the field. The World Bank is owned by its member countries represented by a Board of Governors, which meets once a year, and a Washington-based Board of Directors, which conducts day-to-day business.

The purposes of the World Bank, as stated in Article 1 of the original (Bretton Woods) Articles of Agreement, are:

1 To assist in the reconstruction and development of territories of members by facilitating the investment of capital for productive purposes, including the restoration of economies destroyed or disrupted by war, the reconversion of productive facilities to peacetime needs and the encouragement of the development of productive facilities and resources in less developed countries.

2 To promote private foreign investment by means of guarantees

or participations in loans and other investments made by private investors; and when private capital is not available on reasonable terms, to supplement private investment by providing, on suitable conditions, finance for productive purposes out of its own capital, funds raised by it and its other resources.

3 To promote the long-range balanced growth of international trade and the maintenance of equilibrium in balances of payments by encouraging international investment for the development of the productive resources of members, thereby assisting in raising productivity, the standard of living and conditions of labor in their territories.

4 To arrange the loans made or guaranteed by it in relation to international loans through other channels so that the more useful and urgent projects, large and small alike, will be dealt with first.

5 To conduct its operations with due regard to the effect of international investment on business conditions in the territories of members and, in the immediate postwar years, to assist in bringing about a smooth transition from a wartime to a peacetime economy. (World Bank 1989)

The World Bank has a capital stock subscribed by its member countries and divided into shares.

Early years

The World Bank was very much a US creation. Americans made up much of its early leadership and staff and provided most of its capital. The result was 'a strong and enduring American imprint on all aspects of the Bank, including its structure, general policy direction, and forms of lending' (Gwin 1997: 197). The World Bank, in its early form of the IBRD, was largely dependent on selling bonds to raise the bulk of its loan capital. The rest of the available funds came from the subscriptions of member countries – the original capital subscription was $9.1 billion, of which $3.2 billion or 34.9 percent was from the USA (in 1946, when the Bank formally began operations, its initial authorized capital had risen to $12 billion). For the first ten years the US part of this subscription, around one-third of the total, provided the only fully usable component, because the deposit was in dollars, the main currency used in post-war international transactions. Additionally 85 percent of the Bank's bonds were denominated in US dollars and sold on Wall Street. Banks and

insurance companies, the main market for bonds in the post-war period, at first regarded the World Bank with suspicion, seeing it as a 'do-good institution.' So, in its early years, as a supplier of loans to western European governments for reconstruction in the late 1940s, and later as attention shifted toward the richer Third World countries in the 1950s, the World Bank's main mission was to gain the confidence of private investors, especially those on Wall Street. The Bank maintained a Marketing Department (until 1963) on the Street, and employed a syndicate led by First Boston Bank and Morgan Stanley, an investment bank, to sell its bonds. The first president of the Bank (for a mere six months), Eugene Meyer, had been a Wall Street investment banker and government official. The second president, John J. McCloy, a New York lawyer, was seen by Wall Street as its representative, and was charged with taking control of the World Bank away from the New Deal crowd (ibid.: 199). And Eugene Black, president between 1949 and 1962, had been at Chase Bank and was very much Wall Street's man. Indeed, all presidents of the Bank, except two, have been commercial bankers, investment bankers, or lawyers with extensive New York banking connections.

The Bank garnered Wall Street's confidence by insisting on 'fiscal and monetary discipline' on the part of borrowing countries, and by engaging in 'sound banking practices,' such as confining its activity to project lending for the construction of easily defined, public utilities (electric power, transportation and other economic infrastructure), with strict end-use supervision, including close control over disbursements from loans.

This restricted version of project lending was, however, also in line with what little economic theory at the time dealt with developmental issues. The idea of early development economics was to remove blockages to, or set the preconditions for, economic growth by making capital investments (project lending) that would raise productivity. Money spent on program lending (that is, broader social programs dealing with education and health as well as more directly economic projects) was regarded as a waste of scarce resources. So the World Bank essentially loaned money for infrastructure projects that could be shown to be viable in terms of prospective interest and principal repayments. (Indeed, this has remained its basic function until the present day, bearing in mind that 'project lending' has at last been broadened to include education, health and similar 'social' areas.) The Bank did have to show, however, that borrowing countries were

'creditworthy' in general, as well as in terms of the particular project. Thus, from the very beginning of lending to Third World countries (a loan to Chile made in 1948 was conditional upon repayment of pre-war bonds), some degree of Bank assessment of overall economic policies has occurred. In this the Bank was at first more conservative than most of its member governments, for most of which a mixed economy, incorporating elements of capitalism and socialism, was considered conventional economic wisdom, at least until the late 1960s. By comparison, the Bank 'always was pro-market' (Kapur et al. 1997, vol. 1: 481).

During the 1950s the World Bank, along with other conventional institutions, evidenced a rising interest in broader issues of income distribution and poverty. This was partly because Bank presidents actually went to Third World countries and saw for themselves the conditions prevailing there, along with the usual Bank missions and official staff visits. To quote the Bank's Report in 1955:

> Experience has shown again and again that monumental projects are not necessarily useful projects. But the unspectacular – the care of equipment, the teaching of skills, the careful nurturing of land – is often of inestimable value … [Economic development] has to be an awakening in the minds of millions of people, in all walks and conditions of life – an awakening that will move people to work more effectively for tomorrow's rewards … The Bank starts its tenth year with a sense of much learned and much done, but with a full realization that there is much more yet to learn and much more yet to do. (World Bank 1955: 38–9)

The main reason, however, why the World Bank, along with many other First World institutions, suddenly expressed concern for the masses of poor people in the world stemmed from cold war engagement between the USA and the USSR, with the Third World as its hot spots and ideological battlegrounds. As US Secretary of State John Foster Dulles said, in overcoming conservative congressional objections to making soft loans to Third World countries: 'It might be good banking to put South America through the wringer, but it will come out red' (La Feber 1993: 177). The Eisenhower administration finally moved in the direction of increasing aid to Third World countries in the late 1950s, arguing that such aid was 'an investment for peace.' The World Bank, with what had by that time become a conservative, reliable, 'sound' banking image, symbolized by an AAA bond rating

awarded in 1959 and maintained ever since, proved to be a plausible vehicle. In its initial form as the IBRD, however, the Bank (with an additional agency, the IFC, augmenting Bank lending in the private sector after 1956) was not necessarily the best lending mechanism, since it charged near-market interest rates. Something that looked more like an 'aid' institution had to be added (Kapur et al. 1997).

Thus the late 1950s saw a number of changes. Within the Bank, lending was directed toward the poorer countries, rather than Europe, or the richer non-European countries, while 'development' was coming to mean poverty alleviation, rather than transportation and electrical power projects. The sectoral coverage of lending was widened from industrial infrastructure investment toward the agricultural sector, where most of the people in poor countries worked. Outside the Bank a geopolitical strategy of containment, which had focused US military, diplomatic and economic interest on the 'rim countries' surrounding the USSR and China, was extended to include a broader swath of countries said to be 'just entering world society.' There was a flood of intellectual interest in questions of 'underdevelopment,' as in sociological modernization theory and development economics, while area studies departments were opened all over the campus map. In particular the incoming Kennedy administration, acting out of a mix of humanitarianism and security concerns, was active in strengthening US foreign assistance. US policy toward the Bank in the late 1950s and early 1960s seems to have been motivated by three concerns: building a strong organization to promote a 'free and open world economy'; leveraging funds from the private market and other countries to ease the burden on the USA; and supporting countries deemed important to US interests (Gwin 1997: 209). All this led to a second wave of institution formation in the period 1958–62, including the formation of the IDA within the World Bank.

The idea of adding an IDA to the Bank's lending structure had first been mentioned in 1951 as a way of achieving the objectives of (US) President Truman's Point Four program, announced in his 1949 inaugural address – that is, making the benefits of scientific-industrial progress available to underdeveloped countries as part of the cold war. The concrete proposal that actually established the IDA was made in 1959 by the US Treasury headed by Secretary Robert B. Anderson. A year earlier a Special United Nations Fund for Economic Development had been formed. The USA wanted to pre-empt that organization and keep development funding within the Bank (see

Chapter 2). The purposes of the IDA as stated in Article I of the Articles of Agreement were:

> to promote economic development, increase productivity and thus raise standards of living in the less-developed areas of the world included within the Association's membership, in particular by providing finance to meet their important developmental requirements on terms which are more flexible and bear less heavily on the balance of payments than those of conventional loans, thereby furthering the developmental objectives of the International Bank for Reconstruction and Development … and supplementing its activities. (IDA 1960)

The IDA would offer 'soft loans' ('soft' meaning over long periods of time and at very low rates of interest) from revenues derived from 'Part I' donor counties, for purposes that were not necessarily revenue-producing, or directly productive in the usual economic sense, in what were called 'Part II' recipient countries. Most of the money would come from capital subscriptions from donor countries, rather than from bond sales. Under Article V of the Articles of Agreement, the use of IDA resources and the conditions of its financing were outlined as follows:

1 The Association shall provide financing to further development in the less-developed areas of the world included within the Association's membership.
2 Financing provided by the Association shall be for purposes which in the opinion of the Association are of high developmental priority in the light of the needs of the area or areas concerned and, except in special circumstances, shall be for specific projects.
3 The Association shall not provide financing if in its opinion such financing is available from private sources on terms which are reasonable for the recipient or could be provided by a loan of the type made by the Bank.
4 The Association shall not provide financing except upon the recommendation of a competent committee, made after a careful study of the merits of the proposal. Each such committee shall be appointed by the Association and shall include a nominee of the Governor or Governors representing the member or members in whose territories the project under consideration is located and one or more members of the technical staff of the Association. (ibid.)

Again, the IDA was originally a US-inspired institution. As Robert Anderson said, on recommending the IDA for congressional approval, 'it showed the rich countries' commitment' to helping the poor countries 'advance their economic life under free institutions' (Sanford 1982: 46). The USA provided 42 percent of the initial contribution (limited originally to $1 billion) and mobilized support from other developed countries. Originally the IDA funded projects in much the same manner as the IBRD, and indeed worked closely with it, but the concept of 'project' was widened in the IDA to include 'social' projects dealing with health and education, while eligibility for IDA loans was restricted to poor countries. In the end the IDA opened the Bank to a broader perspective on development lending that made possible its emphasis on poverty and basic needs in the 1960s and 1970s.

Poverty and basic needs

The appointment of George Woods as president of the World Bank in 1963 proved momentous. While Woods had a banking background, as chairman of First Boston Bank, he had worked in investment rather than bond sales, the bailiwick of the previous president, Eugene Black. At that time, the IBRD faced a combination of high earnings from past investments, but diminishing investment opportunities in the infrastructures of its traditional client countries. The solution lay in a new and more risky lending policy with longer repayment schedules, more technical and other kinds of direct assistance, and loans primarily in agriculture – including potential involvement in the politically contentious area of land redistribution. For the Bank's new policy to be effective, the limited funds originally paid into the IDA had to be replenished from increased subscriptions from donor countries, and from IBRD profits, something that proved difficult and contentious. And there was a frustrated move away from economic growth as the central focus of the Bank's lending policies and toward issues of poverty alleviation which was picked up later when Robert S. McNamara replaced Woods as Bank president. As a result of this new 'crusading energy' the Bank's lending doubled during the 1960s, the size of its staff tripled (with growth especially in professional economists), the number of member countries increased, especially in Africa, and lending escalated for projects in new areas such as water supply, sanitation, education and agriculture, areas that led to greater cooperation with UN agencies such as the FAO and UNESCO. The World Bank, and especially its IDA component, but also increasingly

the IBRD, began to use income per capita as a criterion for lending, rather than the traditional creditworthiness or performance, with its clientele becoming poor rather than middle-income countries – India and Pakistan received 70 percent of IDA allotments in the 1960s. Even so, Woods finally resigned, disillusioned with the lack of support for his attempted transformation of the institution from a bank to a development agency.

The presidency of McNamara (1968–81) is often regarded, at least by (New Deal-style) liberals, as the Bank's halcyon days. Previously employed at the Ford Motor Company and in the Kennedy and Johnson administrations (as secretary of defense), and renowned for his advocacy of scientific management, Robert McNamara nevertheless came with a fierce determination to redefine the Bank into a development agency dealing with poverty issues. The motives behind this seem to have combined genuine, compassionate generosity with the realization, intensified by the Vietnam disaster, that US national security was incompatible with a world of poverty – as McNamara put it during a 1966 speech: 'without development there can be no security' (Kapur et al. 1997, vol. 1: 219). By 'development' McNamara meant more than the Bank's long-lasting fixation on economic growth. The notion that economic growth produced beneficial effects that trickled down to the poor (with the implication that governments should trust in an eventual equity of benefits produced by the market) had come under extensive criticism in academic and bureaucratic-institutional circles. As a social engineer, McNamara translated this changing theoretical perspective into the position that poverty could be eradicated through direct policy intervention, as in Lyndon Johnson's 'War on Poverty' within the USA. Under the McNamara presidency, the Bank continued to believe fundamentally in the efficacy of free markets, but took a more equivocal view of ownership, believing that managerial competence was more important than private entrepreneurship, so that loans could be made under public ownership systems within an overall conception of greater governmental intervention in the development process – it should be added that this political position was not shared by many of the Bank's staff, or by some donor governments.

The main problem was defining a poverty alleviation policy that would suit the Bank's existing lending practices based in project lending, which would appeal to its principal shareholders and could be sold to borrowing countries. The period 1968–73 saw a number

of temporary enthusiasms – population control, various employment policies, nutrition, health, water supply – all culminating in the later 1970s with a 'basic needs approach' to lending – that is, giving greater attention to need rather than output in the allocation of resources. For example, the Bank's Urban Development Department, formed in 1972, engaged in a series of 'sites and services' projects – that is, providing new house sites and public services to an area – and then housing upgrading in slum areas, the main problem being the recovery of costs from low-income homeowners. But none of these proved sufficient. Finally, during a 1973 Nairobi speech, McNamara came up with a theme for the rest of the decade: the Bank would carry out large rural development schemes focused on small farmers as its main vehicle for direct poverty alleviation. Even so, this proved difficult to translate into 'bankable projects.' Eventually the final form was called 'integrated rural development projects.' Bank loans and technical assistance were given for key agricultural inputs (fertilizer, seeds) and infrastructure (water, electricity, roads) aimed at small farmers in a specific geographical area (hence a 'project') which would increase productivity, providing surpluses that could be sold in markets, which in turn would raise (money) incomes. Such projects, however, proved to be easier to outline on paper in Washington than to carry out in the field: it turned out that little was known about rain-fed tropical agriculture in Africa, the prime regional target of Bank lending, and that attitudes and institutions were more difficult to change than technology. Even more, major land tenure reforms were a prerequisite of any agricultural development aimed at the poor. Otherwise loans went mainly to middle-income and richer farmers, increasing income inequalities. As a result of all this, even the World Bank's own Operations Evaluation Department called most such projects 'failures.' Well before the end of McNamara's presidency, the ardor had gone from the poverty initiative that, at its height, had amounted to no more than a third of Bank lending, with the rest going to the traditional areas of infrastructure investment. Debt and balance of payments in Third World countries became leading issues, with 'structural adjustment' as the solution (Kapur et al. 1997, vol. 1: chs 5, 6).

Structural adjustment

Dissatisfied with ad hoc project lending, and with countries needing foreign exchange to pay for oil imports and meet interest payments, McNamara said in 1979 that the Bank should use program loans to

induce 'reforms' in recipient, mainly middle-income, countries. By this time, within an overall policy regime shift from Keynesianism to neoliberalism, the meaning of the term 'reform' was being changed to mean structural adjustment lending to promote export orientation and trade liberalization. The World Bank would follow the lead of its more senior partner, the IMF, under a division of labor that allocated 'stabilization programs' (short-term adjustment lending) to the Fund and longer-term 'structural adjustment lending' (SAL), aimed at correcting deeper 'structural' problems, to the Bank. In 1980 the Bank laid out the general conditions under which structural adjustment loans (SALs) would be made available. The argument was that the new conditions faced by Third World countries – deteriorating terms of trade and growing current account deficits – forced them to reconsider how they might 'adjust' their development patterns and economic structures. The Bank's new lending program would provide loans that were policy-based (rather than project-based), extending over several years, and would provide direct support for specific policy reforms decided upon during 'dialog' with the borrowing country. The specific 'reforms' were not yet decided upon exactly, although they would continue the trend toward 'liberalization' mentioned previously.

Indications of the direction in which things were going were, however, provided by a 1981 report on development in sub-Saharan Africa prepared by the Bank's African Strategy Review Group coordinated by Eliot Berg, a market-oriented economist from the University of Michigan (World Bank 1981). This combined remnants of McNamara's small-farmer strategy with a strong advocacy of the market and a critique of state intervention. The report found that the basic problems of the sub-Saharan region – slow economic growth, sluggish agricultural performance, rapid rates of population increase, balance of payments and fiscal crisis – stemmed from a combination of internal and external factors exacerbated by 'domestic policy inadequacies.' The list of inadequacies went something like this: trade and exchange rate policies overprotected industry, held back agriculture and absorbed administrative capacity; there were too many administrative constraints and the public sector was overextended, especially in the direction of hopelessly corrupt and inefficient parastatals (government-owned corporations); there was a bias against agriculture in price, tax and exchange rate policies. These areas of the macroeconomy had to be changed, the group concluded,

if production was to be given a higher priority. While (supposedly) reticent about advising specific policy measures, the report found existing state controls over trade to be ineffective, and recommended that private sector activity should be enlarged, that agricultural resources should be concentrated on small capitalist farmers, and that countries should follow an export-oriented development strategy. The report was received with widespread, bitter criticism from the governments of the countries it was supposed to help, and with whom 'dialog' had presumably taken place.

This turn to a more policy-interventionist stance, evident in the late McNamara years, was reinforced in 1981, with a change in the Bank's presidency to A. W. Clausen, formerly head of the Bank of America. Under the Clausen presidency, poverty took a back seat to the new driving forces of macroeconomic policy, stabilization and balance of payments adjustments, all understood within a more right-wing doctrine of the strict limits of governmental intervention and the virtues of 'flexible, self-adjusting free markets.' The Clausen presidency also brought new personnel with different political-economic beliefs into the Bank. As head of the Bank's crucial economics department, McNamara had favored Albert Fishlow, an economic historian then teaching at Yale University. But after an editorial in the *Wall Street Journal* attacked Fishlow's supposed (state) interventionist (Keynesian) tendencies, and derided his interest in 'things like income distribution in Brazil,' Anne Krueger, an energetic, market-oriented neoliberal, was made chief economist of the Bank (Kapur et al. 1997, vol. 1: 339). More fundamentally, the shift from McNamara to Clausen corresponded with a distinct move to the right in key donor countries – Margaret Thatcher became prime minister in Britain in 1979, Ronald Reagan was elected president of the United States in 1980, and Helmut Kohl was elected chancellor of West Germany in 1982. A shift in US attitudes toward the World Bank had already been signaled during the Ford administration, when William Simon, secretary of the Treasury, said at the 1976 annual meeting of the World Bank's Board of Governors: 'The role of the private sector is critical. There is no substitute for a vigorous private sector mobilizing the resources and energies of the people of the developing countries' (Gwin 1997: 217).

Thus the Reagan administration came into power in 1981 with antagonistic views of the World Bank and other multilateral institutions and favoring reduced US support for them. David Stockman,

director of the Office of Management and Budget in the Reagan administration, believed that 'the organs of international aid and so-called Third World development … were infested with socialist error' (Stockman 1986: 116). Likewise, the new US under-secretary of the Treasury in the Reagan administration, Beryl Sprinkel, a protégée of Milton Friedman, immediately commissioned a study to see whether the World Bank had 'socialistic tendencies' (in Kapur et al. 1997, vol. 1: 338). The message from the Treasury in a report on US participation in multilateral development banks was that such institutions should foster greater adherence to open markets and the private sector, that loan allocations should be conditional on policy reforms in recipient countries, and in any case that the USA should reduce its expenditures on the banks (US Department of the Treasury 1982). Reagan followed this up with a speech to the 1983 annual meeting of the World Bank Board of Governors saying that countries achieving the most broad-based economic progress had all believed in the 'magic of the marketplace.' As he put it: 'Millions of individuals making their own decisions in the marketplace will always allocate resources better than any centralized government planning process' (Gwin 1997: 231) – a statement that followed Milton Friedman's views almost exactly (see Chapter 1). Against objections from the State Department, the Treasury Department, with support from President Reagan, cut the US contribution to replenishing the IDA by 25 percent, with the clear implication that future participation was conditional on a drastic change in Bank policy away from any notion of state-directed development (Kapur et al. 1997, vol. 1: 338).

Structural adjustment became the main means of carrying these political beliefs into economic practice. At first, these reforms were directly connected with a country's balance of payments, under a 'strict constructionist view' of the Bank's arena of intervention. But eventually this limitation was discarded, and the entirety of a country's macroeconomic structure became subject to change. In the *World Development Report* for 1987 the Bank laid out its role in structural adjustment lending. The Bank said that it had increasingly been recognized that it was virtually impossible to have an investment project that produced a high rate of return in a bad policy environment. Therefore the Bank had introduced new instruments in support of developing countries' programs and policies of structural reform: structural adjustment loans focused on macroeconomic policies and institutional change at the country level; and sector adjustment

loans promoting sectoral policies. These were medium-term lending programs (over several years) that facilitated the reforms through which countries adjusted their policy frameworks so that they could 'achieve sustainable growth' and obtain 'external financing.' The Bank explained that structural adjustment required firm commitments on the part of governments to sustain reform over time. Reform programs needed to be flexible and the Bank supported modifications in policy packages in the light of domestic and international developments. Where policy reforms toward desirable structural change had transitional costs that affected the poor, the Bank worked with governments to develop appropriate programs (World Bank 1987: 34).

The same report also discussed the kinds of policy needed for achieving faster growth in developing countries. First, trade policies to increase international competitiveness: maintaining realistic exchange rates and replacing quantitative restrictions with tariffs reduced countries' 'bias against exports' and moved them toward an outward-oriented trade strategy that improved trade performance and helped them achieve higher rates of growth. Second, policies aimed at macroeconomic stability: lower fiscal deficits through reducing public expenditures were essential for increasing savings and improving resource allocation. Third, complementary policies improved resource allocation, as in fewer price controls, investment regulations and labor market regulations (such as high minimum wages). Speaking of the highly indebted countries, the report urged that the momentum of reform must not be allowed to slacken, even in the face of political difficulties, if the orderly servicing of debt were to be maintained. Interruptions in debt servicing could damage the financial system and make the resumption of normal levels of borrowing from the private capital market difficult (ibid.: 29–35).

We can follow the Bank's new line of thinking, displayed in this account of structural adjustment, through the various *World Development Report*s published during the 1980s. The 1983 *World Development Report* (World Bank 1983: 29) said that foreign trade enabled developing countries to specialize, exploit economies of scale and increase foreign exchange earnings. The 1984 report (World Bank 1984: ch. 3) used 'growth scenarios' to argue that developing countries would improve their positions by changing their economic policies: avoiding overvalued exchange rates, reducing public spending commitments, having an 'open trading and payments regime' that encouraged optimal use of investment resources. The case examples

were the 'outward-oriented' (but not state interventionist!) East Asian countries. In the following year (World Bank 1985: 145) the Bank warned that a 'retreat from liberalization' would slow economic growth. The 1987 *World Development Report* asked what the ultimate objectives of development were. Generally, the answer was 'faster growth of national income, alleviation of poverty, and reduction of income inequalities' (World Bank 1987: 1). The Bank stressed 'efficient industrialization' as the key economic policy. It drew directly on Adam Smith's argument that industrialization and the division of labor, keys to increased productivity, would be retarded by a low ability to trade widely – for small countries this meant that progress depended on the ability to trade freely with the rest of the world. It also drew on Ricardo in arguing that trade allowed a more efficient employment of the productive forces of the world, and on Mill in saying that consumers ultimately benefited through lower prices and being tempted by things they had not previously thought attainable – the latter could revolutionize a country whose resources were undeveloped for want of energy and ambition in the people. State protection of industry in the past, the report said, had led to inefficient industries and poor-quality, expensive goods. So the idea was to reduce trade barriers, switch the economy's focus to exports, and compete vigorously in world markets. By the end of the 1980s a set of structural adjustment policies based in a rightist interpretation of neoclassicism was firmly in place.

Debt relief

While the Reagan administration's ideological predilection may have been for a reduced US commitment to the Bank, the realities of the debt crisis of the 1980s soon overwhelmed political preference. At first, as we saw in Chapter 3, an assumed short-term liquidity crisis in middle-income Third World countries was addressed by IMF stabilization programs. But by the mid-1980s, it had become clear that many countries could not service even their 'rescheduled' debts. The USA, along with other donor countries, was forced to reconsider the role of the multilateral banks, including the previously suspect World Bank, in far more drastic solutions. The Reagan administration was convinced that the Bank had changed in response to US pressure, and that the new kind of structural adjustment lending could respond to the debt crisis by advancing market liberalization. Thus, in a speech to the joint World Bank–IMF meetings in the autumn of 1985, US

Secretary of the Treasury James Baker called for a new and more interventionist role for the Bank in coordinating increased loans from private and multilateral bank sources and ensuring policy changes in debtor countries. Similarly, when the first Bush administration recognized what the commercial banks had been forced into realizing – that Third World debt levels were unsustainable – the Brady proposal of 1989 made debt reduction contingent on 'policy reforms' supervised increasingly by the Bank rather than the Fund. In the Baker and Brady Plans, the US Treasury and the Federal Reserve Board, under the chairmanship of Paul Volcker, were active participants in negotiations with debtor countries – according to Volcker they 'directed the lending of the Bank' (Gwin 1997: 236). And within these conditions, the USA supported increased funding for the IDA in 1987 and a doubling of Bank capital in 1988, with the stipulation that US vetoing power would be maintained even though its proportion of subscriptions fell to 20 percent.

With its new emphasis on structural adjustment, the World Bank caught up in the 1980s with the critique of state interventionism and renewal of neoclassicism that had occurred in 'professional economics' in the 1970s. In line with this renewal, 'structural adjustment' came to mean a process of change in the international financial system, and in the economic positions of individual countries, that was necessitated by the oil price increases of 1973–74 and 1979–80. Most basically, structural adjustment meant a 'combination of supply- and demand-side policies … directed towards the transformation of the structure of an economy in response to serious disequilibria, aiming both to restore macroeconomic equilibrium and to improve microeconomic efficiency' (Stern with Ferreira 1997: 540). Initially this meant using capital accumulating in surplus countries, as in the oil-exporting members of OPEC, to sectorally transform borrowing countries toward export orientation. Subsequently it meant establishing macroeconomic policies that might produce stable prices, full employment and a positive current account balance, all intended to 'restore internal and external balance' to an economy. It also meant microeconomic policies aimed at increasing the efficiency of the supply side of an economy, as in privatization, increasing tax incentives to producers, changing trade policy, and so on (a fuller list is given in a discussion of the 'Washington Consensus' in Chapter 1, p. 14). So in general the structural part of adjustment entailed two broad movements: changing the structure of incentives toward profit orientation, increasing the role

of markets as compared with states and augmenting private property rights; and restructuring the sectoral composition of an economy toward tradable (and especially exportable) goods. Under the Bank's structural adjustment program, accounting for about a quarter of its total lending, sums of money large enough to draw the interest of borrowing countries' senior policy-makers are made available in quickly disbursed loans in exchange for broad commitments to change the economy in general (SALs), or a main sector of the economy in particular (SECALS). In the late 1980s and early 1990s, the heyday of structural adjustment, the Bank was making loans averaging about $100 million each to fifty countries a year, predominantly in Africa and Latin America (Kapur et al. 1997, vol. 1: 520). In this sense, conditionality is the link between the Bank's version of neoclassical economic beliefs, turned in the right direction through an injection of neoliberalism during the Reagan and Bush administrations in the USA, and the commitments made by borrowing countries to follow specific conditions stipulated by the lending institution as the basis for making a loan or allowing subsequent drawings of previously committed loan money. While IMF conditionality specifies ten or fewer policy measures that can be monitored by the institution, with further drawings made contingent on a country's satisfying perhaps a quarter of these performance criteria, the Bank's conditionality is far broader, amounting often to fifty or more measures, many of which cannot be monitored through statistical indicators, leaving subsequent drawings to be judged qualitatively by the Bank or negotiated with the country concerned. Increasingly the demarcation lines between the IMF and the World Bank – short-term for the Fund and long-term for the Bank – have tended to fade, while agreement has tended to cohere on the direction of policy prescription (Polack 1997).

Under the structural adjustment policy of the late 1980s, the Bank came to specify changes in dozens of areas of macroeconomic policy – so many that neither the World Bank nor even the government concerned could ensure that policy conditions were being enforced. Out of sheer practical necessity the Bank was forced in the direction of borrower 'ownership' of the reforms supposedly emerging from lender–borrower dialog. Along with this, from the mid-1980s onward, the Bank began to stress issues of 'good governance' understood as efficient, orderly and accountable public administration. Also, after accepting the renewed emphasis on growth stressed in the Baker Plan of 1985, the Bank (as had earlier the IMF) came to be more heavily

criticized for the austerity of the structural adjustment programs it was sponsoring. A UNICEF report called *Adjustment with a Human Face* pointed to the deteriorating health and education conditions, the worsening employment situations and the falling incomes in countries undergoing structural adjustment (Cornia et al. 1987).

The replacement of Clausen with Barber Conable, a former Republican congressman, in 1986 and the resignation of Krueger in 1987 brought a renewed emphasis on poverty issues. Deserted by the very administration officials who had persuaded him to accept the presidency of the Bank, when the US Treasury Department led other major shareholders into vetoing the proposed World Bank budget for 1986–87, and faced by continuing hostility led by David Mulford, assistant secretary for international affairs at the US Treasury, Conable felt free to reorient Bank policy in the direction of social issues, while four years later, with Lewis Preston as president, poverty reduction became the Bank's 'overarching objective.' Subsequently the Bank tried to reinvent itself McNamara-style as a development agency fighting poverty.

In line with this, the Executive Board in 1989 approved use of the World Bank's resources in debt or debt-service reduction for heavily indebted countries, essentially following the Brady Plan (see Chapter 3). The Bank used several financial devices, including new money, buybacks and discount bonds, to provide official support for countries deemed to have 'strong adjustment programmes' (Kapur et al. 1997, vol. 1: 656). The Bank was heavily involved in Mexico, but played a minor role in the more general Latin American debt crisis of the 1980s. Its main role, along with the IMF, has been more recent, in the Heavily Indebted Poor Country (HIPC) initiative begun in 1996. This is an attempt at reducing the external debt of the world's poorest countries – those eligible for highly concessional assistance from the IDA, and which also face an unsustainable debt situation even after the application of traditional debt relief mechanisms (such as under the Paris Club agreement). To get the assistance, countries have to implement 'integrated poverty reduction and economic reform programs.' The World Bank uses a Trust Fund to forgive 50 percent of the annual debt service due on existing IDA debt.

This new attitude on the part of the Bank responded to an environment of increasing criticism, including substantial amounts from within the institution. The Wapenhans Report, named after a Bank vice-president and entitled 'Effective implementation: key

to development impact,' found that 'at least twenty percent of the 1800-odd projects in 113 countries contained in the Bank's $140 billion loan portfolio presented major problems' (World Bank 1992a). The Bank's Operations Evaluation Department published a report, entitled *World Bank Structural and Sectoral Adjustment Operations*, in June 1992, which critically reviewed the SAL and SECAL programs: 'In the 18 Sub-Saharan African countries reviewed, no less than 14 had experienced a fall in investment rates during adjustment.' Less than 20 percent of adjustment-related technical assistance loans were substantially effective, and 15 percent had only negligible impact. The report said that decreased social expenditures as part of structural adjustment lending had led to 'unsatisfactory results' in terms of poverty; income inequality had increased in some countries and landless farm workers had borne the greatest burden of higher food prices (World Bank 1992b).

Revisions

So it is that some commentators find that the World Bank shifted at the end of the 1980s and in the early 1990s to a revised neoliberal model stressing 'market-friendly' state intervention and good governance (political pluralism, accountability and the rule of law) with a renewed emphasis on social issues such as poverty and education and a dedication to debt reduction (Kiely 1998; World Bank 1991: 1–2). Thus, in the 1990s, the various *World Bank Development Report*s outlined a new 'holistic approach' to development involving social safety nets, poverty, health, education, environment, rural areas and gender considerations, in concert with conventionally neoliberal areas, such as increased property rights, trade liberalization and privatization. In 1997 James D. Wolfensohn, who became president of the Bank in 1995, called for closer relations with other institutions and civil society actors to increase the effectiveness of the developmental effort. In 1998 the Bank carried out a series of consultations with government representatives, bilateral donor agencies, multilateral financial institutions, academics, NGOs and other civil society organizations, together with the private sector. Also in 1998 Wolfensohn suggested an integrated approach to development based on a framework articulated and 'owned' by the country itself, aimed at poverty reduction and sustainable development, known as the Comprehensive Development Framework (CDF). In many respects, this is the Bank's policy answer to criticisms that structural adjustment does little to alleviate poverty.

As the president of the Bank said, the CDF was necessary 'since too many in the developing world were not being helped sufficiently by the development process, and [the World Bank was] in danger of losing the war against poverty' (World Bank 2000a: 5). The CDF attempts to balance the institution's concern for macroeconomic policies stressing economic growth with the social and human aspects of development, and especially poverty alleviation. Outlined in the 1999/2000 *World Development Report*, the CDF has two complementary parts: a stable macroeconomy shaped by 'prudent fiscal and monetary policies'; and the CDF itself, stressing honest governments, strong property and personal rights, supported by an efficient legal and judicial system, human development, as in education and health, physical infrastructure, and sectoral elements such as integrated rural development strategies and urban management (World Bank 1999a). The CDF is based on four principles designed to guide implementation of future development strategies in specific countries. First, the framework emphasizes the need for a long-term, holistic vision of development that considers structural and social issues simultaneously, as well as acknowledging the interlinkages between all economic sectors. Second, the country receiving assistance or loans needs to be in control, taking ownership of the process. This entails the respective governments building consensus domestically and consulting with as many different civil society and private sector actors as possible. The necessary prerequisite to country ownership is an emphasis on partnership between the 'stakeholders' in the development process, again incorporating government, civil society and the private sector of the country concerned, and the main external actors, such as the World Bank, donor countries and bilateral aid organizations. Finally, the CDF calls for regular assessments of actual development outcomes to ensure accountability toward meeting the goals set out in each country's long-term vision (World Bank 1999a, 2000a, 2000b).

The CDF was part of a larger effort by the Bank to produce what it termed a new consensus in the international development community, comprised of various donor organizations and bilateral and multilateral agencies such as the UN and the OECD, on the ingredients for successful development policies. Several UN conferences have also led to the production of a document entitled 'On common ground' (OECD 2000), which retains central elements of the CDF proposal. Obviously, the Bank is trying to reposition itself within a much larger group of international organizations that emphasize a dedication to

alleviating poverty and providing development assistance (see Chapter 2). Emphasizing agreement on the fundamentals of development policies with other institutions of the UN, which historically have been much better received by the Third World and NGOs, the World Bank is signaling a shift in approach to its many critics. The Bank's leadership is acutely aware of its public relations problems: 'much suspicion still exists on the part of certain well-organized members of civil society. This must be overcome' (World Bank 2000a: 9). Likewise, in a 1999 meeting the Development Committee, a joint effort of the Board of Governors of the World Bank and the IMF, proposed that Poverty Reduction Strategy Papers be prepared by national authorities, in close collaboration with Bank and Fund staff, in all low-income countries receiving support from the Bank's IDA and the IMF's ESAF. Again, the emphasis was on strategies that were country-driven, developed transparently with broad and even popular participation. Yet the strategies were also supposed to be clearly linked with the development goals and principles of the CDF. Some fifty countries have subsequently implemented the CDF principles. The World Bank now says that participation, including poor or marginalized groups and the private sector, is crucial to building country ownership of national development strategies.

The 2000 *World Development Report: Attacking Poverty* (World Bank 2000c) also reflects this struggle over image and substance outside and within the Bank. As with the CDF, the report indicates a shift in World Bank thinking toward situating the social and cultural dimensions of poverty alleviation at least on a par with structural adjustment. At the beginning of the report, Wolfensohn says that the Bank 'now also recognize[s] the need for much more emphasis on laying the institutional and social foundations for the development process and on managing vulnerability and encouraging participation to ensure inclusive growth.' Yet he insists too that macroeconomic stability and market-friendly reforms remain equally essential for reducing poverty (ibid.: vi). The report is subsequently organized around three central themes of opportunity, empowerment and security. The theme of material opportunities for poverty reduction still refers to the necessity for economic growth, but also includes the quality and pattern of growth and the importance of the equality of distribution, themes that are novel to Bank thinking. Further, the report stresses the need for empowering the poor by establishing, and strengthening, state and social institutions receptive to their needs

and which offer poor people a chance to shape decisions that affect their lives. The eradication of various forms of discrimination also figures prominently. Finally, the report says that providing security for the poor means reducing their vulnerability to economic shocks, natural disasters and personal misfortunes through various social instruments, such as accessible insurance mechanisms for health or disability. A sizable part of the report draws on interviews with 40,000 poor people, emphasizing individual experiences of powerlessness, vulnerability and denial of access to essential services, such as education or healthcare (Narayan 2000). Chapter 3 of the report sets out a case for the importance of redistribution in favor of the poor by noting that poverty is inextricably tied to income inequality, rather than being a result of a lack of economic growth. Chapter 4 argues that markets and pro-market reforms are simply beneficial to the poor despite contrary evidence from a number of countries mentioned elsewhere in other parts of the report. Again, the evidence points to tension between competing convictions embedded in the Bank's overall position.

Consequently, commentary from the media, civil society and NGOs to the Bank's poverty report ranged widely. The *New York Times* saw the report throwing 'stones at the orthodox temple development economics' and reading 'like something written by … the "Berkeley Mafia",' and suggested that James Wolfensohn was 'proving hard to outflank on the left' (Kahn 2000). Oxfam, the British development NGO, found that the report was a 'flagship document that the World Bank can be proud of' and called for implementing its appeal for a fight against inequality (Oxfam 2000). Oxfam lamented, however, the 'neo-liberal hangover' still apparent in the chapter dealing with the benefits of market-friendly reforms for poor people. The (British) Institute of Development Studies (IDS 2000) said that ideas such as the empowerment of poor people were treated as decorations, and that the report offered nothing beyond cosmetic and semantic changes. Certain events surrounding the preparation of the report added ammunition to this last, more critical perception. Originally, the writing team was led by Ravi Kanbur, an academic economist from Cornell University. But Kanbur resigned in May 2000, citing undue outside pressure over changing the emphasis on policies of redistribution and social spending (Denny 2000). According to news accounts, Kanbur's reaction was a result of direct intervention by the US Treasury Department and its then secretary, Lawrence Summers,

in rewriting the report (Global Policy Forum 2000). While the Bank subsequently denied this kind of censorship, saying the final version remained true to its earlier drafts, Kanbur's resignation nevertheless provides more evidence for the struggle over influence on the course of World Bank policy taking place within the institution and among powerful interests outside. The *Economist* called the resulting 'chaos' a 'Washington Dissensus' (Economist 2000).

Let us note a couple of the results of this 'dissensus' within the Bank. In two stunning research papers, one published in the World Bank's Working Paper series, the second as yet unpublished, Branko Milanovic, of the World Bank's Research Department, criticizes some of the crucial positions taken by the Bank, the IMF and the WTO. Milanovic says that conventional international trade theory implies that increased trade and foreign investment should make income distribution more equal in poor countries and less equal in rich countries, but that finding these effects in reality has proved difficult. Using data from household budget surveys, and looking at the impact of openness and direct foreign investment on relative income shares, he finds some evidence that, at very low average income levels, the rich benefit from openness. As income levels rise, that is at around the income level of Colombia, Chile or the Czech Republic, the situation changes, and the relative incomes of the poor and the middle class rise, compared with the rich. Thus it seems that openness makes income distribution worse before making it better – or that the effect of openness on income distribution depends on a country's initial income level (Milanovic 2002a).

In a second research paper, Milanovic (2002b) argues that the current view of globalization as an automatically benign force is seriously flawed. It focuses on one, positive face of globalization, while entirely neglecting a malignant one. Two key historical episodes in globalization are misinterpreted: the period 1870–1913 was not pleasant for those who were being 'globalized' since colonial constraints prevented them from industrializing; and the period 1978–98 is shown to be uniformly worse than the period 1960–78. Following Rodrik (2000), Milanovic looks at what is probably the key study by Dollar and Kraay (2000) linking 'openness' to economic growth. Milanovic shows that their positive conclusion is almost entirely the result of including the huge population of China, one of the few remaining communist countries. Milanovic finds that only by seriously misreading the recent evidence can the partisans of globalization argue for

its unmitigated beneficence. Globalization led by capitalist interests alone, like that of a century ago, is likely to produce 'a wild global capitalism with social exclusion, unbridled competition and exploitation' (Milanovic 2002b: 1). Global capitalism needs to be 'civilized' as national capitalisms were after the Second World War, a period that then witnessed the fastest growth in history – but the civilizing role has to be assumed by global institutions as well as national states. Chinks in the ideological armour?

Criticizing the Bank

Why this new face on an old institution? From 1986 onward, the Bank came under increasing criticism from NGOs representing social and environmental movements, from people concerned about poverty, from gender-oriented groups, and from many other concerns that mobilized people and ideas and motivated liberal political constituencies in donor countries. As criticism of the World Bank mounted, the institution began to respond, certainly by adjusting its image, and arguably by modifying its substantive policies. More than the other two global institutions examined here, the Bank has appeared receptive to criticism. Increasingly, the Bank has acknowledged the necessity of pursuing more 'comprehensive strategies' that emphasize 'democratic, equitable, and sustainable development' (Stiglitz 1999: F587). Some commentators see this as a genuine attempt by the Bank to reinvent itself; others detect creative window-dressing as part of a process some describe as the art of 'paradigm maintenance.'

Robin Broad, a professor at the American University, describes the mechanisms by which the World Bank performs 'paradigm-maintenance' – a term she takes from Robert Wade (1996) – on its research and thinking on development economics. The Bank, she says, is not only the main lender of public money, it is also the world's largest development research body. The Bank's development research department is important because it performs work for other aid agencies and banks, which often follow the course prescribed by the Bank – she calls the Bank's DEC (the World Bank's research department, currently under the development economics vice-president) the 'research powerhouse of the development world.' The Bank claims that governments and researchers should view DEC as an impartial 'knowledge bank' on development, conducting rigorous and independent research.

But after a careful look inside, including a couple dozen interviews

with former and current Bank staff, Broad reached a different conclusion: the World Bank has played a critical role in legitimizing the neoliberal free-market paradigm over the past quarter-century, and its research department has been vital to this role. The work of perhaps the best-known World Bank researcher, the appropriately named David Dollar, exemplifies neoliberal paradigm-maintenance. For many in the media, academia, and policy-making circles, Dollar's work on trade and economic growth produced empirically proven 'facts' that 'globalizers' – countries wedded to the Washington Consensus, especially to liberalized trade – experience higher economic growth rates than 'non-globalizers.' As Dollar and Kraay (2002) phrased it in an article in *Foreign Affairs*: 'openness to foreign trade and investment, coupled with complementary reforms, typically leads to faster growth.'

How did Dollar's work become prominent? Why does the work of Bank DEC researchers who support the neoliberal policy agenda get widespread attention? Broad discovered a set of six interrelated processes and mechanisms through which DEC, at times collaborating with other parts of the World Bank, performs its paradigm-maintenance role by privileging individuals and work resonating with this ideology. These mutually reinforcing structures include a series of incentives – increasing an individual's chances of being hired, of advancing his or her career, of being published, of being promoted by the Bank's external affairs department, and, in general, of being assessed positively. And they also include selective enforcement of rules, discouragement of dissonant discourse, and even the manipulation of data to fit the paradigm. As Broad's article demonstrates, this incentive or reward system is typically unstated, may even negate formal or stated procedures and, as such, functions as 'soft' law. This is done in a way that undermines debate and nuanced research conclusions, instead of encouraging the confirmation of *a priori* neoliberal hypotheses. These incentives raise significant questions about the World Bank's own argument that it produces work of the utmost quality and integrity. Broad's research should raise alarm about further concentrating and aggrandizing this role of knowledge production and marketing in the World Bank. The present moment of identity crisis within the Bank, Broad thinks, is an opportune moment to question paradigm maintenance and to rethink fundamentally research-knowledge production and dissemination at the World Bank. Governments and private foundations that support World Bank research and publicity would do far better to support independent

research institutions that are stimulating a more diverse development debate (Broad 2006).

After the article was published, Daniel Lederman and Martin Ravallion of the Bank's DEC wrote to the editorial board of the journal (*Review of International Political Economy*) calling into question the quality and accuracy of Broad's article. Quoting from their letter (a copy of which fell into our email system from 'out of the blue'): 'It is plain to us that Broad's article was published without an adequate scholarly assessment of the validity of her allegations … This was poor scholarship on her part. But what went wrong with your own journal's reviewing process? It is regrettable that a scholarly journal has not done its due diligence in making sure that the alleged evidence provides an accurate and fair account of reality' (Lederman and Ravallion 2006).

The journal's editorial board, however, defended its decision to publish Broad's piece and offered the Bank a chance to debate about it in the journal. They declined. 'Paradigm maintenance' by the Bank includes this kind of polite threat aimed at critics. At one time such an action would have devastated a critic's career. Now it passes almost unnoticed.

So, as we have said, throughout the 1980s the World Bank, acting in concert with the IMF, exercised considerable powers of control over most Third World and post-communist countries. Much of this power resided in the policy conditionality of the widespread structural adjustment programs. But power was exercised also in the Bank's traditional 'investment' or project lending. Investment loans finance a range of physical and social infrastructures and account for 75 to 80 percent of all Bank lending. Originally the loans were for physical infrastructure projects and engineering services, under the assumption that these would increase productivity and lead to economic growth. Beginning in the late 1980s Bank investment lending came to focus more on social development and the public policy infrastructure facilitating private sector activity, under the new assumption that these help alleviate poverty. Projects range from urban housing construction to rural development, water and sanitation, natural resource management, education and healthcare. The Bank's extensive power in this area comes from the huge amounts of loan capital it can raise, the additional amounts its stamp of approval leverages, and its ability to actually get things done when other agencies, including those of governments in recipient coun-

tries, cannot – low-cost housing and site and service provision are outstanding cases in point.

But it was in exactly this area of project lending that the Bank was first massively criticized – especially by environmental movements and related NGOs. From the mid-1980s on, the Bank faced mounting criticism for lending money to projects that cause large-scale environmental damage. The big early case was the Polonoroeste project, involving five World Bank loans to the Brazilian government in the early 1980s to construct a 1,500-kilometer highway and feeder roads into the northwest Amazon region. The highway was seen as connecting frontier areas of the Amazon forest with the more heavily populated south central region, and was expected to result in a model case of integrated rural development. The (paved) highway was completed in three years, however, long before support services or governmental authority could be organized. The population of the affected area grew from 600,000 to 1,600,000 in six years and extensive logging occurred, along with incursions into Amerindian reserves. Thousands of people died of malaria in areas where public health services were virtually non-existent. As a result, the Bank was heavily criticized for supporting an environmental and social disaster by Brazilian and US environmental groups, by members of the US Congress, and by Sixty Minutes, the most widely watched US television current affairs program, which called the project a massive waste of taxpayers' money. Criticism from environmental NGOs was largely ignored until the US Treasury Department, under James Baker, told the Bank to 'clean up' its environmental act as part of the Treasury's renewed role in the debt crisis. Indeed, the USA voted against a proposed loan to Brazil for dam construction in 1986, supposedly on environmental grounds. Environment, development and human rights groups held an alternative summit during the IMF/Bank annual meeting in September 1986, during which activist rock-climbers hung a sign reading 'World Bank destroys tropical rain forests' from the top of the Bank building. In response the Bank was forced to create an Environmental Department, to integrate environmental assessment into its project lending, and to consult, at least in setting up assessment procedures, with NGOs (Kapur et al. 1997, vol. 1: 279–80; Wade 1997).

The Brazilian rainforest adventure was, however, but a prelude to an even greater controversy. This concerned the World Bank's funding of the Sardar Sarovar dam project on the Narmada river

in northwest India. World Bank involvement in the Narmada Valley began in 1985, in the project's early stages, before thorough studies had been conducted, and long before the government of India knew much about the environmental and human costs. The Bank's loan of $350 million to fund the Sardar Sarovar dam did more than pay for the concrete – the Bank's approval legitimized a project that had no input from the people whose homes were to be flooded. The earliest estimate by the Indian government, in 1979, of the number of families to be displaced by flooding created by the dam was around 6,000. By 1992, that figure had grown to 40,000, while local people calculated that 85,000 families containing nearly half a million people would be displaced. The government's argument was that the 'displaceable' people, who happened to be overwhelmingly Adivasi (an indigenous group), should suffer for the 'good of India,' or more truthfully, for large landowners in need of water for irrigation (Roy 1999: 34). The Indian Ministry of Environment cleared the project for construction in 1987. But arguments were soon made that damming the Narmada river would destroy 4,000 square kilometers of natural deciduous forest and would lead to the spread of malaria, to soil erosion, to a range of damaging effects on the river and its estuaries, and to waterlogging and salinization of an extensive surrounding area (Fisher 1995: 34). Three major contentions arose about the Bank's handling of these potential environmental catastrophes: (1) discrepancies between World Bank policies and the obvious practices followed at the project; (2) the quality of the official studies carried out by the Indian government; and (3) post-completion studies replacing comprehensive pre-construction assessments (ibid.: 34).

In the Narmada Valley, few people knew of the threat to their homes and lives until after the deal with the Bank had been finalized. Thanks, however, to organizers such as Medha Patkar, an activist working with the affected people since the beginning, by 1986 the news had got around. Patkar suggested that 'the World Bank, even to us, was distant, remote, and powerful – a mere abstraction' (Patel 1995: 183). A people's group had been formed in each affected state. Subsequently these local organizations formed an alliance called the Narmada Bachao Andolan (NBA, Save the Narmada Campaign). The NBA formed ties with NGOs from each affected region and all began to work for improved policies on resettlement and rehabilitation. A national debate on the dam began. In 1987, the government of the state of Gujarat offered an 'improved' resettlement policy. NGOs

differed in their reactions. Some continued to work with the government and the proponents of the project. Many others followed the lead of the NBA in opposing the construction of the dam altogether (Fisher 1995: 23). Through continuous struggle with the government, the latter group shifted from wanting a voice in the plans, to rejection of top-down decision-making in India and the World Bank. In 1989, 50,000 activists gathered in the valley to fight 'destructive development' (Roy 1999: 37). The NBA announced that they would drown rather than move. In late 1990 and early 1991, a dedicated group of 6,000 people marched 100 kilometers toward the dam site, with a seven-member sacrifice squad resolved to give their lives for the cause. With their hands tied with yarn to symbolize non-violence, they encountered police and proponent activists before they reached the site. The Adivasi were seen as a 'handful of activists holding the country to ransom,' and were beaten, arrested and dragged onto trucks by the police, who had joined the side of the middle-class urban Indians (ibid.: 38). The activists were dropped off miles away, but that did not stop them from marching back and beginning again. Demanding a halt to the construction and a comprehensive review, the sacrifice squad escalated the pressure by beginning a hunger strike that lasted twenty-six days.

As news of the NBA's non-violent actions spread, NGO support arrived, including assistance from groups in countries supplying most of the funds for the dam project, namely the USA and Japan. The Narmada Action Committee was formed from NGOs specializing in the environment, human rights, development, religion, housing, agriculture, energy and indigenous rights. Bitter local dissent also arose as the NBA took its struggle to the international stage, since its interests were at odds with those of many NGOs. Many feared that local actions would be dictated from above. But the NBA took a vigilant stance toward outside NGOs, with their financial and intellectual power, and a relatively healthy exchange of information and energy occurred. All the groups involved shared a criticism of the current development discourse, a skeptical attitude toward the West and the 'modernizing' Indian government's notion of 'progress' (Fisher 1995: 26–7).

Because the World Bank was seen as steering this overall development trajectory, not to mention its direct financial influence, the institution became a main target for the international campaign. The message was that World Bank approval was dangerous if it funded

projects indiscriminately. As a result of mounting pressure, specifically from a campaign by Friends of the Earth in Japan, the Japanese government canceled a loan funding part of the Sardar Sarovar project. In India human rights were increasingly violated as the government violently cleared the way for the rising water. Since the World Bank is part of the United Nations system, the Narmada Action Committee pressured the Bank to be accountable to international human rights law, and to take responsibility for the increasing number of random arrests, beatings and illegal detentions. European NGOs, together with a spokesperson from the NBA, toured shareholding countries in Europe. The tour influenced finance ministries and brought European activists to the international struggle in solidarity with the people of the Narmada Valley. Further environmental activist protest occurred in Washington, DC, and 'acutely embarrassed by the glare of unfavorable media, the World Bank announced that it would commission an independent review of the Sardar Sarovar Projects – unprecedented in the history of Bank behavior' (Roy 1999: 39). In 1992 an independent review said that environmental considerations had not been taken seriously in planning the project and that there was no possible solution to the resettlement and rehabilitation problems in the valley using the existing approaches (Udall 1995: 216). The review recommended that the Bank cease its involvement immediately in order to reassess the situation. In response, the Bank sent a mission to find an alternative to the embarrassing option of simply pulling out entirely. Bank officials had to be protected by hundreds of police during the mission. Nevertheless, a document emerged outlining the steps the Indian government should take during a six-month provisional period. On the day before the end of the provisional period, the Indian government announced that it would finish the project independently, and the $170 million remaining in the Bank's original $450 million commitment was withdrawn. Since the Bank pulled out, hunger strikes and Gandhian civil disobedience have continued, along with (unsuccessful) appeals to the Supreme Court of India.

Under intense outside pressure, and for the first time, the Bank allowed an independent commission to investigate whether the institution's own rules on social and environmental impacts had been violated in approving the project. After ten months, the review panel published a report that was highly critical of the project and found numerous violations of the Bank's own procedures and regulations, which eventually led to the decision to withdraw from the project. The

Narmada episode, and an emboldened NGO community, pushed a reluctant Bank into establishing a permanent independent Inspection Panel in 1993 (Wade 1997: 726–9). NGOs from countries in which the Bank funds projects can now appeal to this commission, asking that it investigate whether the Bank has violated its own standards, although the final decision on whether to start an inquiry still rests with the Bank's Board of Governors – contrary to initial NGO demands. Nevertheless, the Inspection Panel's mere existence is evidence that severe external pressures on the Bank by actors other than G7 finance ministries have led to changes in institutional behaviour that leave lasting impressions on its governance structure.

A new Bank?

Relationships of some kind have long existed between the Bank and the NGO community. But until the early 1980s, many NGOs involved in development issues were quietly supportive of the World Bank's project-based lending. NGOs and the Bank seemed to share a common goal of furthering progress in the development of the Third World. With the Bank's new-found emphasis on structural adjustment in the 1980s, and the demise of McNamara's basic needs strategy, that relationship grew more acrimonious and, by extension, the World Bank's external image worsened significantly (Kapur et al. 1997, vol. 1: 1207–10). Over time the Bank became a focus of public protest and a unifying adversary for many NGOs. The NGO community has grown rapidly, making NGOs ever more visible players shaping public opinion on an international scale. For example, as concern about the environment weighed heavier in mainstream political debates in the West, the resulting growth of the environmental movement meant that the World Bank would now come under increasingly close scrutiny with regard to its environmental policies (Wade 1997: 653–62). WEDO (the Women's Environment and Development Organization) looked at the gender make-up of the top posts at the global financial institutions and found the following:

Boards of Governors:
IMF: men 97.8 percent; women 2.2 percent
World Bank: men 94.5 percent; women 5.5 percent
Boards of Directors:
IMF: men 100 percent
World Bank: men 91.07 percent; women 8.93 percent

Yet a rough breakdown of the gender composition of the world's poor finds men making up 30 percent and women 70 percent (WEDO 2002). The point was to connect global institutional policy with the actual causes of poverty. In making these arguments many NGOs shifted strategy from lobbying national governments, and their various ministries and departments, to addressing the World Bank directly through public campaigns – for example, sending them the kind of information revealed by WEDO. The Bank has increasingly come under pressure from civil society and NGOs in the First and Third Worlds. But for the Bank even to engage seriously with civil society actors, the traditional reluctance of the institution to deal with anyone but the national governments of member states and their finance ministries had to change. External criticism of the World Bank for failing to adequately address the social, cultural and environmental impacts of its projects and structural adjustment conditions has tended to increase. For example, Kevin Watkins of the British NGO Oxfam summed up the effects of structural adjustment in sub-Saharan Africa as follows:

> the application of stringent monetary policies, designed to reduce inflation through high interest rates, has undermined investment and employment. At the same time, poorly planned trade-liberalisation measures have exposed local industries to extreme competition. Contrary to World Bank and IMF claims, the position of the poor and most vulnerable sections of society has all too often been undermined by the deregulation of labour markets and erosion of social welfare provisions, and by declining expenditures on health and education. Women have suffered in extreme form. The erosion of health expenditure has increased the burdens they carry as care-takers, while falling real wages and rising unemployment have forced women into multiple low-wage employment in the informal sector. (Watkins 1994: 126)

Meanwhile Africa Action was arguing that the World Bank and the IMF had undermined the health of Africans through the policies imposed by structural adjustment. The key issue with adjustments, Africa Action argues, is whether they build the capacity to recover and whether they promote long-term development. The adjustments dictated by the World Bank and IMF did neither of these. African countries, the organization said, require essential investments in health, education and infrastructure before they can compete internationally.

But the World Bank and IMF required countries to reduce state support and protection for many social and economic activities, and insisted on pushing weak African economies into markets where they were unable to compete. The austerity policies attached to World Bank and IMF loans led to intensified poverty in many African countries in the 1980s and 1990s. This increased the vulnerability of African populations to the spread of diseases and to other health problems. Public sector job losses and wage cuts associated with World Bank and IMF programs increased hardship in many African countries. During the 1980s, when most African countries came under World Bank and IMF tutelage, per capita income declined by 25 percent in most of sub-Saharan Africa. The removal of food and agricultural subsidies caused prices to rise and created increased food insecurity. This led to a marked deterioration in nutritional status, especially among women and children. Between one-quarter and one-third of the population of sub-Saharan Africa is chronically malnourished. So the policies dictated by the World Bank and IMF exacerbated poverty, providing fertile ground for the spread of HIV/AIDS and other infectious diseases. Cutbacks in health budgets and privatization of health services eroded advances in healthcare made after independence and weakened the capacity of African governments to cope with the growing health crisis. The dramatic drop in health expenditure in the 1980s and 1990s resulted in the closure of hundreds of clinics, hospitals and medical facilities. Those still open were left understaffed and lacking essential medical supplies. Consequently, during the past two decades the life expectancy of Africans has dropped by fifteen years.

The World Bank and the IMF, Africa Action says, have recently professed greater commitment to 'poverty reduction.' The World Bank has also increased its funding for health, especially for HIV/AIDS programs. While Africa Action welcomed the shift in focus toward prioritizing social development and poverty eradication, it thought that fundamental problems remained. New lending for health and education could achieve little when the debt burden of most African countries was already unsustainable. The organization thought that the new spin on World Bank and IMF priorities failed to change their basic agenda. Indeed, it appeared to be largely a public relations exercise. The conditions attached to World Bank and IMF loans reflected the same orientation of the past two decades. Indeed, recent moves toward promoting poverty reduction had actually permitted the institutions to increase the scope of their loan conditions to

include social sector reforms and governance. This allowed even greater intrusion into the domestic policies of African countries. Africa Action found it inappropriate that external creditors should have such control over the priorities of African governments, and it was disingenuous for such creditors to proclaim concern with poverty reduction when they continued to drain desperately needed resources from the poorest countries.

Africa Action therefore called for an end to World Bank and IMF policies that undermine health. This required canceling the debts that prevent African governments from making their full contribution to addressing the health crisis. It also required ending the imposition of harmful economic policies as conditions for future loans or grants (Colgan 2002).

Recognizing the public perception that it needed to address these critiques, the Bank tried to institutionalize various kinds of co-operation with non-governmental actors. For instance, the World Bank's NGO and Civil Society Unit is responsible for coordinating the Bank's relationship with its external interlocutors in civil society – the express aim is to 'mainstream civic engagement into the World Bank's operations' (World Bank NGO and Civil Society Unit 2001; Fox and Brown 1998; Nelson 1995). We focus here on an assessment of one initiative, the Structural Adjustment Participatory Review Initiative (SAPRI).

SAPRI is supposed to be a cooperative effort between the Bank and a network of 250 NGOs with the stated purpose being 'to improve understanding about the impacts of adjustment policies as well as about how the participation of local, broad-based civil society can improve economic policymaking' (SAPRI 2000). The initiative is the direct result of a proposal to the incoming World Bank president, James Wolfensohn, in 1995, from a group of NGOs calling for a bottom-up review of structural adjustment lending. After months of negotiations, the Bank agreed to a joint review exercise in seven countries, with steering boards equitably composed of representatives of local civil society, governments and the World Bank. On a global level, the NGOs are represented by the SAPRI Network (SAPRIN), and their slogan, 'Standing Up to Structural Adjustment,' indicates that they are not likely to agree with the Bank on an assessment of structural adjustment projects (SAPRIN 2000a). In addition, a number of features built into the SAPRI structure – equal representation of NGOs, independent financing – ensured that the World Bank does

not have direct control over the selection of the civil society actors it engages with, or over the particular policy areas examined by SAPRI. The review initiative started in 1997 with two global public forums, followed by country assemblies in each of the seven participating nations (Ghana, Uganda, Zimbabwe, Ecuador, El Salvador, Bangladesh and Hungary), with informal work conducted also in Mexico and the Philippines. In each country, SAPRIN involved hundreds of organizations, from unions to peasant federations, women's groups and environmentalists. Research into the effects of structural adjustment was undertaken in four stages: (1) mobilization of a broad cross-section of local populations affected by structural adjustment; (2) national public forums organized by local civil society steering committees in conjunction with Bank and government officials; (3) participatory research by World Bank and SAPRIN teams into selected issues to deepen analysis; and (4) public review of the results of the forums and the research at a second national forum with modifications suggested for a final report. SAPRIN then prepared a draft synthetic report and presented it to the World Bank in July 2001. A final report, published in April 2002, reached the following conclusions about structural adjustment programs:

1 Trade liberalization, financial sector liberalization, the weakening of state support and reduction of demand for local goods and services have devastated local industries, especially small and medium-sized enterprises providing most national employment.
2 Structural and sectoral policy reforms in agriculture and mining have undermined the viability of small farms, weakened food security and damaged the natural environment.
3 A combination of labor market reforms, lay-offs resulting from privatization and the shrinking of labor-intensive productive sectors has undermined the position of workers causing employment to drop, real wages to fall and workers' rights to weaken.
4 Privatization of public utilities and the application of user fees to healthcare and education have disproportionately reduced the poor's access to affordable services.
5 Increased impoverishment caused by structural adjustment has affected women more than men.
6 Many of the anticipated gains in efficiency, competitiveness, savings and revenues from privatization have failed to materialize. Trade liberalization has increased rather than decreased current-account

> deficits and external debt, while transnational corporations have become more powerful in the structurally adjusted countries. (SAPRIN 2002)

As the work on the report proceeded, however, SAPRIN encountered 'difficulties in working out terms of reference and other agreements among the three local partners – SAPRIN, the Bank and governments – that form the national technical teams' (SAPRIN 2000b). In addition, the NGO network complained that the Bank had failed to honor some of its negotiated commitments. Especially, the Bank proved unwilling to respond to the concerns of civil society participants about structural adjustment policies voiced at the country forums. The NGOs asserted that the institution, 'despite its stated interest in consultation and partnership, has not been accustomed to working in equal relationships in which it is not dictating the terms of engagement.' SAPRIN acknowledged the political realities of powerful influences on the World Bank, especially those connected to its largest member country: 'The Bank is, of course, constrained in its ability to respond to civil society by the U.S. Treasury and its financial-sector constituencies' (ibid.). In effect, institutional inertia combined with external interests severely limited the ability of new initiatives, such as SAPRI, to result in fundamental shifts in policy, regardless of the support these changes might receive from individual World Bank staff members, up to the president of the Bank himself. Then, as the research findings summarized above were being announced in interim reports and public forums, and as the critical content became clear, the World Bank withdrew from SAPRI in August 2001. A 'Town Hall Meeting' on Poverty Reduction Strategies in spring 2002 at the IMF headquarters in Washington, DC, was attended by the managing director of the IMF and the president of the World Bank. At a press conference after the meetings both were asked about structural adjustment. The IMF managing director, Horst Kahler, replied that 'We should not put in doubt this basic principle – that sound macroeconomics is good for growth, and growth … may not be everything, but is needed to fight poverty.' James Wolfensohn, president of the World Bank, said that 'the position which is being taken by both the Fund and the Bank at the moment is moving much more to assisting countries develop the [macroeconomic] framework, as we tried to do in the PRSPs' – that is, both merely reiterated the basic positions taken by their respective institutions (IMF/World Bank 2002).

About this time, in 2000, the World Bank published a report entitled *Voices of the Poor: Can Anyone Hear Us*? (Narayan 2000) with an introduction by Clare Short, UK Secretary of State for International Development, and James Wolfensohn, president of the World Bank – the report reached safe, moralistic conclusions such as 'poverty is multidimensional' and 'households are crumbling under the stresses of poverty.' The last sentence of the introduction reads: 'Our hope is that the voices in this book will call you to action as they have us.' But in the case of SAPRIN, where thousands of civil society movements called on the World Bank to listen, its own action was simply to leave the discussion. Why might this be? What these social movements were telling the Bank was that the poverty they sought to 'alleviate' had been produced by the structural adjustments they themselves had imposed – that they were merely rectifying a small part of their own massive mistakes. This made everything they had done in the way of structural adjustment over the previous twenty years not meaningless (if only we were dealing with mere existential angst!) but pernicious, even malevolent, given that thousands of people active in development had been telling them for years to stop 'structurally adjusting' desperate countries. So the president of the World Bank did not listen to SAPRIN, because he could not. For he would hear, and he might even learn, that his finest, most splendid ideas had produced the worst, most harmful effects.

Millennium Development Goals

Thus, the turn of the millennium saw the neoliberal policy discourse and its institutions take a liberal turn (in the sense of New Deal liberalism) toward debt relief and development goals. Looking behind debt relief, we can see a tension between kind-hearted benevolence – the people of the developed world vowing to help the poorest people of the world by forgiving their debts – and cool-headed control – the will to manage the Third World and to make it into a mimic of the West. You would hardly know it from the sensational news reports appearing at the time. But this 'writing off $40 billion owed to international agencies' mainly amounted to a refinancing of the IMF and World Bank's HIPC initiative. As part of this, the HIPC countries have to demonstrate, to the economists at the IMF and the World Bank, that they have adopted, and are carrying out, policies judged 'sound by the international community.' That 'community' is represented by the IFIs, and behind these the secretary of the US

Treasury Department and the British Chancellor of the Exchequer. At their meeting in early June 2005, the finance ministers of the G7 countries agreed to provide additional financial resources, ensuring that the financing capacity of the World Bank, the IMF and the African Development Bank was not reduced by the HIPC initiative. This will eventually lead to 100 percent debt cancellation of outstanding obligations of eighteen of the poorest countries in the world. The agreement was formalized at the G7 summit meeting in Gleneagles, Scotland, later in 2005. There was a lot of criticism about the fact that only a small part of poor-country debt would be forgiven and that relief would be long in coming. But whatever its problems of timing and coverage, this commitment to ending the international debt of the poorest countries does show signs of being motivated by a genuine benevolence. It does contribute to achieving the UN Millennium Development Goal of halving world poverty by 2015.

But look beneath the headlines, down the list of conclusions from the June G8 meeting, not too far, only to point 2. This reads as follows:

> We reaffirm our view that in order to make progress on social and economic development, it is essential that developing countries put in place the policies for economic growth, sustainable development and poverty reduction: sound, accountable and transparent institutions and policies; macroeconomic stability; the increased fiscal transparency essential to tackle corruption, boost private sector development, and attract investment; a credible legal framework; and the elimination of impediments to private investment, both domestic and foreign. (G8 2005)

The aspect of point 2 seized on by just about all the media was 'good government practices,' such as transparency, anti-corruption and credible legal frameworks. The other aspect of point 2, macroeconomic stability, private sector development, and removing impediments to private investment, domestic and foreign, together with bits on free trade and open markets in later points, went almost unmentioned. Here we find the G8 countries, or rather their treasury departments, in collusion with the IFIs, telling poor countries how they must run their economies if they want to receive debt relief. Just as the 'deserving poor' are made to do the repentance shuffle to earn a charitable handout, or the homeless pretend instant arm-waving Christian conversion to get a bed for the night, now we find the rich countries

telling the poor countries of the world how they must 'reform' (that is, obey) to get their debt relief. And the 2008 G8 meeting said at its conclusion:

> Globalization is a key driver for global economic growth and strong, prosperous economies, supported by shared values of political democracy, economic freedom and accountable institutions. Globalization and open markets offer great opportunities for our societies, emerging economies and developing countries … Open trade and investment policies strengthen economies. All countries should take steps to develop, maintain and promote regimes that welcome foreign investment, guarantee non-discriminatory treatment for foreign investment, and ensure freedom to transfer capital and returns from investment. Any foreign investment restrictions should be very limited, focusing primarily on national security concerns, and should adhere to the principles of transparency and predictability, proportionality, and accountability. Furthermore, we note the importance of high standards of investment protection in international agreements including fair and equitable treatment, prompt, adequate and effective compensation in the event of expropriation, and access to international arbitration to resolve disputes … Open and competitive capital markets can promote economic growth. (G8 2008)

In other words, neoliberal Washington Consensus policies prevail, despite protests, critique, proven failure, supposed reform, and so on. Paradigm maintenance by ostentatiously 'listening to our critiques' before ignoring everything they say.

The key terms in the new liberal neoliberalism are the Millennium Development Goals (MDGs) and debt relief; the key institutional actors include, besides the USA and the IFIs (the World Bank and the IMF), a broader range of wealthy countries meeting as the Group of 7 or 8 (G7/G8), the United Nations as a body and as specific development agencies (UNDP especially), and one important development economist, Jeffrey D. Sachs. At the Millennium Summit held at the UN in September 2000, the largest gathering of world leaders in history adopted the UN Millennium Declaration, committing their nations to a global partnership that would reduce extreme poverty and setting out a series of time-bound targets, with a deadline of 2015, that became known as the MDGs. The MDGs, outlined in Box 4.1, are said to be 'basic human rights – the rights of each person on the planet to health, education, shelter, and security.'

Box 4.1 Eight UN Millennium Development Goals and eighteen time-bound targets

Goal 1: Eradicate Extreme Poverty and Hunger

Target 1 Reduce by half the proportion of people living on less than a dollar a day

Target 2 Reduce by half the proportion of people who suffer from hunger

Goal 2: Achieve Universal Primary Education

Target 3 Ensure that all boys and girls complete a full course of primary schooling

Goal 3: Promote Gender Equality and Empower Women

Target 4 Eliminate gender disparity in primary and secondary education preferably by 2005, and at all levels by 2015

Goal 4: Reduce Child Mortality

Target 5 Reduce by two-thirds the mortality rate among children under five

Goal 5: Improve Maternal Health

Target 6 Reduce by three-quarters the maternal mortality ratio

Goal 6: Combat HIV/AIDS

Target 7 Halt and begin to reverse the spread of HIV/AIDS

Target 8 Halt and begin to reverse the incidence of malaria and other major diseases

Goal 7: Ensure Environmental Sustainability

Target 9 Integrate the principles of sustainable development into country policies and programs; reverse loss of environmental resources

Target 10 Reduce by half the proportion of people without sustainable access to safe drinking water

Target 11 Achieve significant improvement in the lives of at least 100 million slum dwellers, by 2020

Goal 8: Achieve a Global Partnership for Development

Target 12 Develop further an open trading and financial system that is rule-based, predictable and non-discriminatory, includes a commitment to good governance, development and poverty reduction, nationally and internationally

Target 13 Address the least developed countries' special needs. This includes tariff- and quota-free access for their

exports; enhanced debt relief for heavily indebted poor countries; cancellation of official bilateral debt; and more generous official development assistance for countries committed to poverty reduction

Target 14 Address the special needs of landlocked and small island developing states

Target 15 Deal comprehensively with developing countries' debt problems through national and international measures to make debt sustainable in the long term

Target 16 In cooperation with the developing countries, develop decent and productive work for youth

Target 17 In cooperation with pharmaceutical companies, provide access to affordable essential drugs in developing countries

Target 18 In cooperation with the private sector, make available the benefits of new technologies – especially information and communications technologies

The MDGs synthesize commitments made separately at various international conferences and summits during the 1990s. They are said to be innovative in that they explicitly recognize interdependence among growth, poverty reduction and sustainable development; they say that development rests on the foundations of democratic governance, the rule of law, respect for human rights and peace and security; they are based on time-bound and measurable targets accompanied by indicators for monitoring progress; and they bring together, in the eighth Goal, the responsibilities of developing countries with those of developed countries, founded on a global partnership endorsed at an International Conference on Financing for Development in Monterrey, Mexico, in March 2002, and a similar conference held at the Johannesburg World Summit on Sustainable Development in August 2002.

The nearest the MDG initiative comes to making sense is in Jeffrey D. Sachs's (2005) book *The End of Poverty*. Sachs is director of the Earth Institute at Columbia University, and Special Advisor to UN secretary-general Ban Ki-moon. From 2002 to 2006, he was director of the UN Millennium Project and Special Advisor to United Nations

secretary-general Kofi Annan on the MDGs. Economic development, he says, is a ladder with the higher rungs representing steps up the path to economic well-being. But a billion people are too ill or hungry to even lift a foot to the first rung. Our generation's 'challenge,' Sachs says, is to help the poorest of the poor escape the misery of extreme poverty so they can begin their ascent to full humanity. Why have the poorest countries failed to achieve economic growth? There are several 'factors,' such as governance failure and lack of innovation, but Sachs relies most on a kind of environmental determinism – many poor countries are poor because they are landlocked and situated in high mountain ranges (like Switzerland?), trapped in arid conditions with low agricultural productivity (like Saudi Arabia?), with tropical climates (like Singapore?) that favor killer diseases (as did once the north of England's hills and dales). The key to ending extreme poverty is to enable the poorest of the poor to get a foot on that ladder of development. The extreme poor, Sachs argues, lack six major kinds of capital: enough human capital, as health, nutrition and skills, to be economically productive; business capital, as machinery and transport, to increase productivity; infrastructure that forms critical inputs into business productivity; natural capital that provides the environmental services needed by human society; public institutional capital that underpins peaceful and prosperous division of labor; and knowledge capital that raises productivity and promotes physical and natural capital (the MDGs). Breaking the poverty trap involves donor-based investments that raise the level of capital per person, producing a capital stock high enough that the economy is sufficiently productive to meet basic needs. Without outside donor funds the necessary investments simply cannot be financed. Ending global poverty by 2025 requires a global compact between rich and poor countries, as with the UN Millennium Project, whereby the rich countries follow through on their previous pledge (made long ago in a similar spasm of optimism) to provide 0.7 percent of GNP as aid. Indeed, the bottom line is about $135–195 billion a year in assistance, significantly less than the 0.7 percent figure. As Sachs (ibid.: 299) says: 'The point is that the Millennium Development Goals can be financed within the bounds of the official development assistance that the donor countries have already promised.' This essentially means that the USA, presently contributing 0.15 percent of GNP as development assistance, would have to contribute half the necessary increase, followed by Japan, Germany, France, Italy and Britain. Hence, our generation, heir to two

and a half centuries of economic progress, can realistically envision a world without extreme poverty. But why should 'we' (the people of the rich countries of the world) do it?

The answer comes suddenly: because 'hard evidence has established strong linkages between extreme poverty abroad and the threats to national security' (ibid.: 331). An economy stuck in the poverty trap often leads to state failure and failed states are seedbeds for violence, terrorism, drug trafficking and disease. If the USA and western Europe want to spend less time responding to failed states in the post-9/11 era, they will have to reduce the number of failed economies. The richest of the rich should therefore do what they 'comfortably can' and come up with their contribution as a 'profound and meaningful demonstration of our generation's unique moment to secure global well-being' (ibid.: 346). Sachs is for an enlightened globalization, in the tradition of Thomas Jefferson, Adam Smith, Immanuel Kant and Marie-Jean-Antoine Condorcet, that would direct criticism at the rich governments of the world, that would encourage the anti-globalization movement to change to a more pro-corporate position, that would encourage trade by removing barriers and agricultural subsidies, and yet would press the USA to end its 'reveries of empire.'

Hence the MDGs are intended to lift a billion of the world's poorest people on to a development ladder that acts as a kind of escalator taking them up into prosperity.

It is truly amazing how many people, including many critical intellectuals, are taken in by this argument. There are a couple of small points of disagreement, however, mentioned with trepidation in the face of such power, concerning the argument presented in Sachs's book, which have to be made. The first is economic in principle and the second is ethical in nature. As to the first trepidation, we doubt that foreign assistance can 'end global poverty.' This is not because not enough aid will be delivered, as indeed will prove to be the case, consuming 95 percent of the subsequent hand-wringing debate, and allowing an easy, moralizing excuse for poverty not being eliminated by 2025 ('if only we had given more'), should anyone remember then. Instead our skepticism concerns the ability of charity-based theories even to begin to understand the causes of world poverty and thus suggest policies that might indeed enable the end of poverty. Sachs's Fifth Avenue approach – appealing to the rich to help the poor – comes with a price label attached. Immediately, that price is a necessary lack of criticism about the sources of wealth in the presently prevailing global

financial capitalism. Associated with this is a lack of criticism of the presently hegemonic policy regime, the neoliberalism that has done so well for the super-rich and quietly famous, so that Sachs blithely asserts that the rich countries have only to enable countries to get to the first rung on the ladder and then 'the tremendous dynamism of self-sustaining growth can take hold' (ibid.: 73) – this is because Sachs forgets that a country can have a high growth rate, and seem to be climbing, while at the same time further impoverishing the poor. In the longer term, the price includes accepting a largely conventional economic historical geography, replete with take-offs, ladders of development and successful transformations, as supposedly bits of India and China represent – he needs to go back to Mumbai and get outside the Hotel Intercontinental. As a result of this blindness, in the present global context, increasing the health and education level of Third World workers through donor investments, as Sachs suggests, is likely to produce a healthier and more educated but unemployed workforce. For to earn 'aid,' supplicant countries have to restructure their economies neoliberally, and join global financial capitalism, so that they reward foreign investment. All this has to be ignored, or merely sniped at (quibbles with the IMF), when appeals are made to the rich to open their pockets … generously.

As for the second trepidation, we find the ethical argument presented by Sachs abhorrent. After hearing an argument on the supposed benefits of foreign aid, all the time assuming that the aim is to make people healthier for their own sakes, we are told that the rich countries should invest in poor countries for the sake of their own security, to prevent failed states, to prevent the poor from becoming terrorists! We should invest in them … because we fear them. This cruel pragmatism that passes for moral reasoning is detached from the rest of the argument, as an afterthought rather than a moving gesture. This is not just because, having written a book on ending poverty, the author was confronted with the practical question: why should a Republican administration that just illegally invaded a Third World country support investing in the Third World poor? It is because the largely conventional economic reasoning produces an ethical vacuum from which emerges, by random choice, depending on the circumstances and the capricious whim of the sorry moralist, an ethics of simple morality ('we should just do good things'), or moral utilitarianism ('it will not cost much') or, at worst, moral pragmatism of fear ('do it to save ourselves'). Sachs's environmental determinism,

in blaming nature, leaves little but pity as the basis for morality. Most seriously the two deficient ideologies combine to disguise the real culprit behind global poverty – the Western imperialist expansion that ruined the civilizations already existing in these 'environmentally deprived' lands that were home to great civilizations – and, thereby, misses too the only viable reason for aid – as reparation for damages done in the past, and continuing into the present. The will to assist the Third World has to come from a sense of global justice, from the critical understanding that the wealth of a few causes the poverty of the many. It has to come from anti-imperialist sentiment, not from the reimposition of a benevolent imperialism.

In 2001, the UN secretary-general presented a *Road Map towards the Implementation of the United Nations Millennium Declaration* (UN 2001), which is said to be 'an integrated and comprehensive overview of the situation, outlining potential strategies for action designed to meet the goals and commitments of the Millennium Declaration.' This 'road map' has been followed by annual reports on progress toward meeting the goals by the UN secretary-general. The main agency charged with 'coordinating global and local efforts' is the UNDP, an organization started in 1946 that sees itself 'advocating for change and connecting countries to knowledge, experience and resources to help people build a better life' (UNDP 2007). But the UNDP has virtually no money to give out as loans or grants. The organization with the money and the neoliberal expertise is the World Bank. So, unlike the IMF, the Bank has been given a new lease on life through the millennium initiatives. Here the central institution is the joint World Bank–IMF Development Committee, formally known as the Joint Ministerial Committee of the Boards of Governors of the World Bank and the IMF on the Transfer of Real Resources to Developing Countries. At the Bank–Fund Annual Meetings in September 2002, the Development Committee set up a monitoring unit with an annual global monitoring report, prepared by Bank and Fund staff in collaboration with other agencies such as the UNDP. The *Global Monitoring Report* reports on how the world is doing in implementing the policies and actions for achieving the MDGs and related development outcomes. The main work is performed by the Bank's Development Economics Vice Presidency (the 'DEC' mentioned earlier). The 2008 *Monitoring Report*, prepared at midpoint to 2015, typically 'presents a mixed picture, one of both significant progress and formidable challenges. The first MDG, reducing extreme

poverty by half, is likely to be met at the global level, thanks to a remarkable surge in global economic growth over the past decade. However, on current trends, the human development MDGs are unlikely to be met' (World Bank 2008a).

But exactly the most optimistic part of this, reducing poverty through the MDGs and neoliberal growth (Sachs's 'ladder of development'), is highly contested. An analysis by Sanjay Reddy and Camilia Minoiu (2007) concludes that, because of uncertainties in the methods used to measure levels of poverty ($1- and $2-a-day incomes per person) and deficiencies in the data collected, 'global poverty may or may not have increased. The extent of the estimated increase or decrease in world poverty is critically dependent on the assumptions made.' In a major review of the World Bank poverty data, Robert Wade (2004) concludes: 'The magnitude of world population increase over the past 20 years is so large that the Bank's poverty numbers would have to be huge underestimates for the world poverty rate not to have fallen. Any more precise statement about the absolute number of the world's people living in extreme poverty and the change over time currently rests on quicksand.' After a detailed critique of the official measurement techniques for Indian rural poverty data, Utsa Patnaik (2008) concludes that between 1993 and 2004 the proportion of the population living below the poverty line increased from 74.5 percent to 87 percent. She adds that China's current official rural poverty line is also absurdly low at about 800 yuan per year or 2.2 yuan per day (less than $0.30), identical to the Indian one, and its estimates of rural poverty are equally gross underestimates. Her observations on India are applicable to other developing countries following reform policies advised by the IFIs that have increased poverty and reduced nutritional levels. But these institutions claim the opposite, namely poverty reduction, because they base their own global dollar poverty lines on the unrealistically low developing-country rural poverty lines. Patnaik concludes: 'Never in the history of economic thought have we seen such wholesale use of illegitimate statistical techniques and such falsification of real trends, as we observe today' (ibid.: 49).

In other words, the World Bank is in the business of 'officially confirming' that the MDGs are 'partly working' by manufacturing the relevant statistics. Its reports on attaining the MDGs are then read as truth. But the truth is that no one knows if poverty is being reduced as part of the millennium effort. We suspect a massive act of global fraud.

What we do know is that neoliberal developmentalism is associated with rising inequality – in the USA and other rich countries, but also more generally in global capitalism. Using data collected by the University of Texas Inequality Project on national structures of pay, Galbraith (2007: 587) finds 'a worldwide pattern of declining inequality from 1971 until 1980, followed by a long and sharp period of increasing inequality from 1981 through the end of the century,' a tendency that he associates with changing 'global macroeconomics' (i.e. the move to neoliberalism and finance capitalism). In a 2007 report, *Inequality in Asia*, the Asian Development Bank (2007) finds that over the last decade most Asian countries, especially the most populous, China and India, have experienced increases in inequality, especially absolute inequality (i.e. absolute differences in the incomes of the richest 20 percent of the population versus the poorest 20 percent). As the ADB puts it, mildly: 'Increases in inequality dampen the poverty-reducing impact of a given amount of growth.' We might add the obvious, although the ADB does not: such 'dampening' occurs because nearly all the additional income produced by neoliberal growth goes to a few rich people.

Essentially the MDGs are just a wish list of goals based in fine ideals, but lacking means of realization – they are supposed to be realized by each national government, in part using funds made available from debt relief, with 'advocacy, monitoring and advice' from the UNDP, the World Bank and other international agencies. The trouble with this kind of proclamation is that it makes it look as though something serious is being done about development, when in fact governments are just carrying on as before. And carrying on as before means organizing the economy so that it benefits the rich. The MDGs are the smily face on this process, and the World Bank is its optimistic guarantor.

Along with this, the World Bank tries to position itself as a liberal player in other global crises. So the Bank is involved in climate change and low-carbon economies – its Clean Energy Investment Framework 'catalyzes markets' to address three 'core development pillars': (1) increasing energy access for the poor in sub-Saharan Africa ('lighting Africa'); (2) helping industrializing countries foster economic growth and move along a sustainable low-carbon development path; and (3) helping developing countries adapt to the impacts of climate change. One problem with this, however, is that industrial growth organized through market systems, the kind of development

pushed by the Bank for decades now, is exactly the main source of increased emissions of carbon dioxide and climate change. A report by the World Resources Institute criticized the Bank itself for not integrating climate change considerations into its own lending. It found that 'almost 50 percent of lending in [the energy] sector was made without any attention to climate change at all' and, further, 'operationally, opportunities to mitigate emissions and reduce climate risk are still not systematically incorporated into strategies and project development' of the MDBs (Multilateral Development Banks) in question. More than 60 percent of financing in the energy sector across these institutions does not consider climate change at all and MDBs remain heavily invested in 'business as usual' (Nakhooda 2008). Another report from the Institute for Policy Studies, *World Bank: Climate Profiteer*, analyzes the World Bank's rapidly developing role as a global carbon broker. With a $2 billion portfolio of carbon finance funds (money used to buy cuts in greenhouse gas emissions from projects in developing countries), the report says that the Bank 'irresponsibly and recklessly continues to perpetuate the world's dependence on climate-altering fossil fuels while profiting from carbon trading.' It finds that the bulk of the Bank's carbon finance portfolio (75–85 percent) has been directed to carbon trades involving the coal, chemical, iron and steel industries, while less than 10 percent of all the funds flowing through these carbon trust funds support 'new renewable' energy, defined as wind, geo-thermal, solar and mini-hydro. The report also states that the Bank is charging 13 percent of the project cost for its brokering role (Redman 2008; BWP Update 59).

Similarly, the Bank announced in May 2008 a new $1.2 billion 'rapid financing facility' to address immediate needs arising from the global food crisis, including $200 million in grants targeted at the vulnerable in the world's poorest countries (essentially giving grants of $5–10 million to very poor countries mainly in Africa). This involves transferring funds from the IBRD to the IDA to increase support for global agriculture and food to $6 billion from $4 billion, and launching risk management tools and crop insurance to protect poor countries and smallholders (World Bank 2008b). A report from the Swedish Nordic Africa Institute, however, points out the obvious: under structural adjustment conditionality the World Bank has deepened rural poverty in Africa, and its proposed solution – relying on liberalized markets – will lead to 'further impoverishment and rising demoralization on the part of African farmers who have faced

deteriorating production and marketing conditions and struggled largely unaided for the past 25 years' (Havnevik et al. 2007: 12).

Dances with wolves

In 2005 James Wolfensohn's second term of office expired. Wolfensohn, to give him his due, had at least tried to change the Bank in what he thought was a progressive direction. He tried to get approval for a third term, but was unable to win the support of the Bush administration. Instead Bush put forward the neoconservative Paul Wolfowitz, former United States ambassador to Indonesia, signer of the Project for the New American Century (PNAC) 'Statement of Principles on American Global Leadership' and, subsequently, as deputy secretary of defense, an architect of Bush's Iraq policy and its most passionate and compelling advocate. (From the wolf in sheep's clothing, to the wolf at the door.) As ambassador, Wolfowitz had played a key role in privatizing and deregulating the Indonesian banking system, reforms blamed by many for the financial crisis of the late 1990s. Opposition to the nomination, however, was centered on his key position in the war in Iraq. Many believed that his predilection for unilateralism and support for ideologically driven reconstruction efforts bode poorly for the future of the Bank. The Brussels NGO Eurodad compiled a list of 1,650 organizations worldwide outraged by the appointment. Polls conducted by the *Financial Times* and the World Bank's own staff association showed support for Wolfowitz at below 10 percent.

Wolfowitz commissioned an external review of the Bank's systems of transparency, accountability, ethics and integrity. The World Bank's negligence in allowing corruption to occur in recipient countries had supposedly been made a theme of the Bank's analysis and lending decisions by Wolfensohn. Wolfowitz made corruption his leading theme, preventing hundreds of millions in Bank lending to countries while corruption was investigated, coordinating the MDBs' anti-corruption efforts, and ordering internal reviews of corruption in Bank programs.

Less than two years into his presidency, however, issues of corrupt practices by Wolfowitz himself began to surface. The Bank's senior human resources officer was not consulted over the terms and conditions offered to Robin Cleveland and Kevin Kellems, former Bush administration officials that Wolfowitz brought with him to the Bank. Of the top five outside international appointments made by Wolfowitz, three were senior political appointees of right-wing

governments that provided backing for US policy in Iraq. It was then revealed that Wolfowitz had increased his girlfriend Shaha Riza's salary, from $136,000 to $193,000 tax free, in violation of Bank rules. Questions were also raised about the propriety and legality of Wolfowitz's role in securing Riza a position with a Defense Department contractor in 2003, before his arrival at the Bank. After a six-week media frenzy, Wolfowitz admitted what he had done, and was allowed to resign without acknowledgment of his ethical and governance violations. In the wake of the Wolfowitz affair, several high-profile commentators, including former Bank chief economist Joseph Stiglitz, UN secretary-general Ban Ki-moon, and South African finance minister Trevor Manuel, called for an end to the gentleman's agreement that allows the USA to appoint the head of the Bank and the Europeans the director of the IMF. Seven hundred participants in a poll conducted by US development think tank Center for Global Development rejected the traditional selection prerogative of the USA by large margins, with equally strong support for an open, transparent, competitive selection process (BWP Update 56).

Immediately the Bush administration moved to quell this challenge to the status quo. After little or no consultation, they nominated Robert Zoellick, at a salary of $493,940 tax free, former official at the US investment bank Goldman Sachs, previously on the advisory board of Enron, a corrupt US energy conglomerate, deputy secretary of state and former US Trade Representative (see Chapter 5). In 1998, Zoellick had also joined a group of neoconservatives and militarists, many of whom would later form the upper ranks of George W. Bush's foreign-policy officials, in signing statements of the neocon Project for the New American Century. In an essay in *Foreign Affairs* in January 2000 entitled 'Campaign 2000: a Republican foreign policy,' Zoellick criticized US president Bill Clinton for promoting social and environmental clauses within free trade organizations. Zoellick then outlined a new foreign policy based on a concept of a new American century in which unquestioned US military superiority would allow the USA to shape an international order by attacking evil in the world. In a speech to the Heritage Foundation, a right-wing think tank, he said: 'history is not shaped by the faint of heart. We must move now if we are going to build on the global trends favoring private markets, business competition, deregulation, limited taxation, open trade, and flexible labor policies. These trends are sparking economic creativity and dynamism, while helping to knit the world together in

new ways' (Zoellick 2001a: 3). NGO reactions to the appointment were universally unfavorable. In *Behind the Scenes at the WTO*, Fatoumata Jawara and Aileen Kwa (2004) interviewed thirty-four trade ambassadors, negotiators and secretariat staff members, to reveal an extensive catalog of arm-twisting, pay-offs and abuse by the developed countries to force developing countries to sign up to an agenda they disagreed with, while ignoring the issues they had raised (again, see Chapter 5). But Zoellick was immediately and unanimously confirmed as president by the Executive Directors of the World Bank.

The World Bank's website proclaims: 'Our mission is to help developing countries and their people reach the goals by working with our partners to alleviate poverty. To do that we concentrate on building the climate for investment, jobs and sustainable growth, so that economies will grow, and by investing in and empowering poor people to participate in development.' This is totally contradicted by the appointments of Bank presidents like Wolfowitz and Zoellick. If it is to survive by changing, the World Bank needs to be guided by a global democratic political-economic process. The first glimpse of this will come when the USA no longer unilaterally chooses who will be its president.

FIVE
The World Trade Organization

Established on 1 January 1995, the WTO is a more formal, institutionalized version of the General Agreement on Tariffs and Trade (GATT), signed by twenty-three governments in 1947. The GATT/WTO system regulates international trade in goods and services using a system of objectives and rules laid out in articles of agreements among member governments. As an organization, the WTO consists of a director-general (currently Pascal Lamy, former CEO of Credit Lyonnais, and former Commissioner for Trade at the European Commission), four deputy directors-general and a secretariat (or bureaucracy) housed in Geneva, Switzerland, where many UN agencies have their headquarters. Like the IMF and the World Bank, it also exists as a broader institution, in this case consisting of trade representatives sent from member countries to meetings organized at a number of levels, and thousands of specialists, consultants and lobbyists who exercise considerable power – the intricacies of trade regulations inviting expertise. The WTO operates within a discourse that, while changing in emphasis over time, has consistently advocated the 'liberalization of trade' – that is, the freeing of international movements of commodities and (recently) services from governmental restraint. Freeing trade from tariffs and other governmental restrictions, and thereby allowing competition and markets to function more freely at the international level, is said to lead to more rapid economic growth that benefits everyone. Trade liberalization is one of the leading aspects of the post-war economic regime that led to global neoliberalism. But while the GATT was relatively uncontroversial, the WTO, as a leading proponent of neoliberal ideas, is at the center of controversy over the direction globalization has taken. Indeed, protests against the WTO ministerial meeting in Seattle in 1999 have come to symbolize the entire debate over the future course that globalization might take.

History of the GATT

The idea that trade between countries should be freed from governmental intervention is actually quite new. For most of its 500-year

history, capitalism was directed by mercantilist policies involving state restrictions on imports, and incentives for exports, as a way of increasing national power, concentrated in the political might of the state. In particular, under mercantilism a country was considered prosperous when it had a favorable balance of trade, with 'favorable' interpreted as trade yielding a surplus of gold and silver. To achieve this favorable balance, the state intervened vigorously in international relations rather than leaving important economic forces such as trade to be guided solely by the vagaries of the market. Then, in the first half of the nineteenth century, a shift in the class balance of power in the leading capitalist country, Great Britain, led to a change in economic policy. The emerging industrial bourgeoisie was interested in low-cost food imports for workers and expanding export markets for textiles and other products of the Industrial Revolution for which Britain had a clear cost advantage. Yet the British Corn Laws, introduced in 1815, kept food prices high by restricting imports of grains, ensuring high incomes for the landowning class. These laws were repealed in 1846. Only with repeal did capitalism move decisively in the direction of a market-oriented, free-trade regime.

Trade liberalization – that is, the freeing of trade from state-imposed restrictions – and the increased integration of national economies that followed, began in earnest with the Cobden–Chevalier Treaty of 1860, an interstate, bilateral agreement to reduce tariffs (state import taxes) on goods exchanged between Britain and France. It was followed by a series of bilateral trade agreements elsewhere in Europe. In the second half of the nineteenth century international trade expanded rapidly, with the global economy becoming more regionally specialized, especially between an industrial core and an agricultural periphery, and more integrated by trade relations and investment flows, than at any time previously and, arguably, more than at any time since, including the globalization of the turn of the twentieth century.

With the economic dislocations following the First World War, however, most leading capitalist countries reverted to mercantalist-type protectionism. During the Depression years of the 1930s, arguments that imports ruined domestic industry and increased unemployment made sense to political regimes hard pressed by angry populations. Typically for the period, in 1930 a Republican-dominated US Congress passed the Smoot–Hawley Tariff Act, which increased tariffs on imports by an average of 52 percent. Unilateral increases like

this were met by widespread retaliation in the form of even higher tariffs, trade barriers and countervailing duties elsewhere, in what became known as the 'tariff wars of the thirties.' In the later years of the 1930s, however, big businesses with extensive exporting interests managed to move US Democratic opinion in the direction of a gradual freeing of trade restrictions. Let it be said that this kind of seesawing in external policy position is typical of capitalist economies, even when they are deeply internationalized and apparently completely committed to free trade. States react to crises by protecting their domestic economic base, source of tax revenues and home of the populace that elects them. Even neoliberal presidents, such as George W. Bush, have felt free to impose tariffs on imports that threaten vital domestic industries, as with steel in 2001/02.

After the Second World War, as we saw in Chapter 2, the tendency was to establish international organizations in the search for a new kind of global economic stability. Initially, the idea was to establish three main international institutions, the IMF and IBRD, and an International Trade Organization (ITO) that would regulate trade, as a necessary complement to the other two organizations. Indeed, the USA chaired a preparatory conference in 1943 to draft a charter for the ITO. The USA wanted an organization that would free up trade in the specific interests of large, exporting corporations, but with a market-oriented, deregulated international economy more generally in mind. As the main source of funds for the reconstruction of Europe in the post-Second World War period, and as the world's most powerful economy, an emergent USA could exert considerable political pressure in gaining foreign acceptance for the economic policies its corporations wanted and in charting the eventual course of trade agreements (Hoekman and Kostecki 1996: 2–3). There was, however, a large fly in the international ointment. UN approval would grant universal legitimacy to multi-state agreements, especially those forged under considerable single-state pressure. But the UN was not necessarily or completely under any single state's domination. The UN used more democratic means to reach crucial decisions than the newly hegemonic USA favored. It was regarded with suspicion, especially by conservative groups in the USA, who saw any kind of egalitarian international democracy as a communist plot. Considerable maneuvering was necessary before the USA could get international approval.

Four preliminary conferences on trade were convened under UN auspices: a 'Preparatory Committee' meeting in London in 1946;

a 'Drafting Committee' meeting at Lake Success, NY, in 1947; the Geneva Conference later in 1947; and the Havana Conference, lasting between November 1947 and March 1948. The Geneva Conference produced an interim measure known as the General Agreement on Tariffs and Trade (GATT). The following international conference in Havana, Cuba, was supposed to draft a charter for a regulatory organization, the ITO, that would give the GATT its organizational enforcing mechanism. A US State Department proposal for the ITO was heavily amended in the UN, however, evoking, in turn, opposition from the US Congress. In a statement aimed at Congress, Robert Loree, chairman of the National Foreign Trade Council, said:

> The Council firmly believes that if the United States subscribes to the [Havana] Charter it will be abandoning traditional American principles and espousing instead planned economy and full-scale political control of production, trade and monetary exchange. The Charter does not reflect faith in the principles of free, private, competitive enterprise. Yet these are the basis of the economic well-being, the political liberties, and ultimately the religious liberties of the American people. (Loree 1950: 2)

The greatest problem for Congress lay in granting authority to a UN organization, the proposed ITO, to make agreements, or impose sanctions, that might threaten US national interests. The organization would be able to veto congressional decisions and the Charter for the ITO could be amended by a two-thirds majority, with members not in agreement, or not in compliance with its rulings, potentially expelled from the organization. As Loree put it:

> Acceptance by the United States of a charter which could be amended without its assent, or over its dissent, would be a most unusual proceeding, involving a sacrifice of sovereignty unprecedented in the history of this country. Such provisions relating to amendment in a trade charter, carrying authority for such extensive exceptions and special dispensations as does the Havana Charter, would entail grave danger to the trade and economic well-being of the United States and should not be accepted by this country. The Congress of the United States should, in no event, forfeit the right of review of any amendment of an international trade charter which involves rights and obligations pertaining to American foreign trade and investment. (ibid.: 9)

Thus the USA was not willing to commit to trade policies that might, potentially, hurt the domestic economy for the sake of international economic stability. The USA was specifically opposed to an international organization controlled by UN-type international democracy, with each nation-state having one vote, at a time when the USA considered itself to be far more than one country in terms of economic power and political might.

As a result, legislation approving the ITO agreement reached in Havana never emerged from the US Congress. The earlier GATT, by comparison, was a more tenuous agreement, easily manipulated by powerful countries because it lacked an enforcing organization. Any member country could voluntarily withdraw from the agreement, or selectively bend the rules, whenever necessary. This left the agreement 'flexible and pragmatic,' even though in practice, with the intricacies of trade, the GATT necessarily came to be treated somewhat like an international organization. This is how a tentative agreement became the 'rule book' governing the world's commerce in commodities.

The early GATT rounds

With the failure of the ITO to get off the ground, governments reverted to the provisional agreement on trade and tariffs agreed to at Geneva in 1947 and signed on 15 November 1947 at the Havana Conference. The GATT regulated trade in goods (physical commodities) using agreed-upon principles of liberalization, equal market access, reciprocity, non-discrimination and transparency. Taking these in turn, the principle of trade liberalization and equal market access essentially involved reducing tariffs and deregulating trade in the belief that state intervention disrupted the naturally efficient workings of the market. The principle of reciprocity meant that if one country made tariff concessions, another country had to do the same. The principle of non-discrimination meant giving all kinds of trade between all types of countries 'equal and fair treatment'; within this, the most favored nation (MFN) principle meant that formal agreements between any two member countries had to apply to all members, while the National Treatment policy stated that any member of the GATT had to treat foreign firms in the same way as domestic firms with regard to trade. Finally, the principle of transparency declared that protectionist measures employed by governments should be clearly stated and take a visible form (for example, as a tariff), this being aimed at eliminating non-tariff barriers, such as

systematic obfuscation by customs officials. The basic idea behind the GATT was to eliminate protectionism and discrimination, allowing the trade in goods (but not yet in services) to flow smoothly from one country to another, without disruption or distortion, supposedly permitting all countries to achieve larger output levels, and ultimately increasing the level of economic growth everywhere. The GATT, in other words, attempted to resurrect the classically liberal free-trade principles of the nineteenth century, with more of an appeal to the notion of growth being universally beneficial. Hence the Preamble to the thirty-eight Articles of Agreement read as follows:

> 23 Governments, recognizing that their relations in the field of trade and economic endeavor should be conducted with a view to raising standards of living, ensuring full employment and a large and steadily growing volume of real income and effective demand, developing the full use of the resources of the world and expanding the production and exchange of goods; and being desirous of contributing to these objectives by entering into reciprocal and mutually advantageous arrangements directed to the substantial reduction of tariffs and other barriers to trade and to the elimination of discriminatory treatment in international commerce; agree through their Representatives [to thirty-eight Articles of Agreement]. (GATT 1966)

Since the GATT lacked an organizational structure, the Interim Commission for the International Trade Organization within the UN served as an administrative body regulating the agreement. This provisional GATT Secretariat subsequently coordinated eight rounds of multilateral trade negotiations among an increasing number of countries over the next half-century.

The first round in Geneva in 1947 resulted in 45,000 tariff concessions on trade in goods between the twenty-three attending countries. The following three rounds of negotiations resulted only in unilateral and bilateral tariff concessions among attending countries: twenty-nine countries attended the 1949 Annecy Round in France, resulting in modest tariff concessions; thirty-two countries participated in the Torquay Round in the UK in 1950/51, resulting in 8,700 tariff concessions; and a further meeting at Geneva in 1955/56, with thirty-three countries participating, resulted in modest tariff concessions. Taking place after the formation of the European Economic Community (EEC) in 1957, the Dillon Round, named after the US secretary of the Treasury who led the talks, took place in 1960 and 1961 with thirty-

nine contracting parties. This round tried to ensure that regional trade agreements did not raise average tariff levels among other trading partners. The Kennedy Round, named for the US president, with discussions lasting from 1963 to 1967, and forty-six countries participating, produced a new formula for negotiating tariff concessions in industrial products that resulted in tariff reductions on 35 percent of the attending countries' trade in these goods. This was the first round to negotiate non-tariff barriers to trade. The Kennedy Round extended the anti-dumping code adopted by the GATT (that is, restricting a country's ability to dump goods elsewhere at prices below the cost of production). And it also discussed, in detail, preferential treatment for developing countries (Hoekman and Kostecki 1996). The Tokyo Round, lasting from 1973 to 1979, attended by 102 countries, resulted in further tariff concessions on thousands of industrial and agricultural products, in the adoption of codes addressing subsidies and countervailing duties, with discussions on technical barriers to trade, mainly product standards, government procurement, customs valuations, import-licensing procedures and revisions to the anti-dumping code. The Tokyo Round ended at a time of economic crisis, marked by deep stagflation. Many countries were using (unregulated) non-tariff barriers to restrict imports, while entire economic sectors, such as agriculture and textiles, were slipping beyond GATT control. Powerful countries, such as the USA, simply intervened directly and unilaterally, rather than through the GATT, when they saw vital economic interests threatened. State industrial policies, such as those pursued by the Japanese Ministry of Trade and Industry, were seen to be more effective in producing economic growth than free trade. It was widely thought that the GATT was close to being finished (Prestowitz 1991; Dunkley 2000: 34–41).

The economic crisis of the late 1970s and early 1980s could have seen international trade policy move in any of a number of directions – for example, in the direction of greater guidance by developmental states. Yet, as we have seen, neoliberalism defeated a discredited Keynesianism as right-wing regimes assumed political power in the USA, the UK, West Germany and elsewhere. Free trade was a central component of this selective revival of liberal principles. As Dunkley (2000: 41–5; Milner 1988) suggests, the political-economic balance of power swung against domestically oriented industries and in favor of transnational corporations, especially the new fringe of high-technology firms interested in trade-related issues such as secure

exports and the protection of intellectual property rights, which they thought could be protected only by international agreements, such as a renewed and extended GATT.

The Uruguay Round

Thus the last negotiations to take place under the GATT, the Uruguay Round, lasting from 1986 to 1994, represented not a swansong but a phoenix for international trade agreements. The Uruguay Round signified a new phase in world trading history within a new era of neoliberal globalization. The round attempted to eliminate export subsidies on agricultural goods and textiles and dealt with non-tariff barriers, technical aspects of trade and trade-related investment measures. The round produced a particularly large number of new trade agreements. The Agreement on Textiles and Clothing established a fixed quota on the quantity of textiles exported from the Third World, to be phased out over ten years. The Agreement on Agriculture eliminated all export subsidies for agricultural products over six years for developed countries, ten for less developed countries, with the least developed countries being exempted from the agreement. All state subsidies to farmers were classified according to their impact on production. Subsidies with minimal linkage to the quantities produced, the inputs used, or prices paid, were classified in a Green Box, and not subject to reduction. Other subsidies, including market price supports, were classified in an Amber Box. Amber Box subsidies are subject to an overall limit called the Aggregate Measure of Support (AMS), which was capped, and had to be reduced by 20 percent over six years for developed countries. Exemptions allow support for a particular product to be excluded from the calculation of a country's AMS if that support is not greater than 5 percent of its total value of production. Non-product-specific support which is less than 5 percent of the value of total agricultural production is also exempt from inclusion in the AMS. Specific payments linked to quantities produced, but subject to output controls, were classified in a Blue Box. These are also excluded from the AMS and are exempted from reduction. The Agreement on Subsidies and Countervailing Duties called for the elimination of export subsidies meant to increase exports, or to make domestic products preferable to imports, by 1 January 1998 for developed countries, and 2003 for developing countries, with the least developed countries exempt, and also called for the elimination of countervailing duties

implemented to offset the effects of export subsidies by importing countries. The Uruguay Round again revised the Anti-Dumping Code and made investigation of violations more stringent. Two agreements with significant effects on the environment, food and health security, the Agreements on Technical Barriers to Trade and the Agreement on Sanitary and Phytosanitary Measures, will be discussed later in the chapter. The Uruguay Round also established the WTO as enforcing organization (Dunkley 2000).

Three trade agreements covering entirely new areas emerged from the Uruguay Round: GATS, TRIPs and TRIMs.

The General Agreement on Trade in Services (GATS) is described by the WTO Secretariat as 'perhaps the most important single development in the multilateral trading system since the GATT itself came into effect in 1948' (WTO Secretariat 1999). The GATS extended internationally agreed rules and commitments, comparable to those of the GATT dealing with physical commodities, into the rapidly growing area of the international exchange of services, equivalent in value to about one-quarter of the international trade in goods. A further volume of international transactions in services does not cross national frontiers, because the service supplier (such as a branch of a foreign bank) or the service consumer (such as a foreign tourist) does so instead; yet GATS rules were extended to these kinds of international services as well. The GATS contains a central set of rules modeled on the GATT, and relying on many of the same principles. A preamble to the GATS agreement outlines three considerations that shaped negotiations. First, the establishment of a multilateral framework of principles and rules aimed at progressive liberalization might enable an expanding trade in services that contributed to worldwide economic development. Second, WTO members, and particularly developing countries, would still need to regulate their supplies of services to meet national policy objectives. And third, developing countries should be helped to play a more complete part in world trade in services, particularly through strengthening the capacity, efficiency and competitiveness of their domestic services. Following this, the twenty-nine Articles of the GATS agreement are divided into six parts. An opening section, Part I, sets out the scope and definition of the agreement – Article I says that the GATS (as with the GATT under Article XXIV: 12) goes beyond central governments to include measures taken by regional and local governments, including those of non-governmental bodies exercising powers delegated by governments,

and that the GATS covers all services, except those 'supplied in the exercise of governmental authority' such as central banking and social security. Part II deals with general obligations and disciplines, or rules that apply, for the most part, to all services and all members – GATS Article II, on MFN treatment, states that 'each Member shall accord immediately and unconditionally to services and service suppliers of any other Member treatment no less favorable than it accords to like services and service suppliers of any other country,' subject to a list of exemptions. Part III sets out the rules that, together with a basic categorization of services laid out in Article I, shape each WTO member's individual commitments to admit foreign suppliers of services to its market. In Part IV, Article XIX provides that, starting no later than January 2000, WTO members shall enter into 'successive rounds of negotiations with a view to achieving a progressively higher level of liberalization' of trade in services. Parts V and VI cover institutional provisions similar to those for other agreements in the Uruguay Round package: dispute settlement will take place under central WTO rules and mechanisms; and specialized experts serve as panelists for disputes on services questions.

The Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPs) claims that widely varying standards in the protection and enforcement of intellectual property rights, together with lack of a multilateral framework of principles, rules and disciplines dealing with international trade in counterfeit goods, have been a growing source of tension in international economic relations. In response, the TRIPs agreement addresses the applicability of basic GATT principles, together with those of already existing international agreements, to the provision of intellectual property rights; enforcement measures for those rights; and multilateral dispute settlement procedures. Part I of the agreement sets out general provisions and basic principles, notably a national treatment commitment under which the nationals of other parties to the agreement must be given treatment no less favorable than that accorded to a party's own nationals with regard to the protection of intellectual property. Part I also contains an MFN clause, under which any advantage a government gives to the nationals of another country must be extended immediately and unconditionally to the nationals of all other governments, even if such treatment is more favorable than that given to some of its own nationals. Part II addresses each separate intellectual property right. With respect to copyright, parties to the agreement are required to

comply with the substantive provisions of the Berne Convention, in its latest version (Paris, 1971), for the protection of literary and artistic works. Computer programs are protected as literary works under the Berne Convention, and the TRIPs agreement lays down the grounds for copyrighting programs, databases and other software. Authors of computer programs and producers of sound recordings and films are given the right to authorize or prohibit the commercial rental of their works to the public through TRIPs. Performers are given protection from unauthorized recording and broadcast of live performances (bootlegging) for fifty years. There are a number of other similar provisions for trademark and service marks, geographical indications, industrial designs, and so on. The agreement requires that twenty-year patent protection be available for all inventions, whether products or processes, in almost all fields of technology. Inventions may be excluded from patentability if their commercial exploitation is prohibited for reasons of public order or morality; otherwise, the permitted exclusions are for diagnostic, therapeutic and surgical methods, and for plants and (other than micro-organisms) animals and essentially biological processes for the production of plants or animals (other than microbiological processes). Plant varieties, however, must be protectable either by patents or by a *sui generis* system (such as breeders' rights). Compulsory licensing and government use without the authorization of the right-holder are allowed, subject to conditions aimed at protecting the legitimate interests of the right-holder. The conditions are mainly contained in Article 31. These include the obligation, as a general rule, to grant such licenses only if an unsuccessful attempt has been made to acquire a voluntary license on reasonable terms and conditions within a reasonable period of time; the requirement to pay adequate remuneration in the circumstances of each case, taking into account the economic value of the license; and a requirement that decisions be subject to judicial or other independent review by a distinct higher authority. Certain of these conditions are relaxed where compulsory licenses are employed to remedy practices that have been established as anti-competitive by a legal process. These conditions should be read together with the related provisions of Article 27.1, which require that patent rights shall be enjoyable without discrimination as to the field of technology, and whether products are imported or locally produced. Part III of the agreement sets out the obligations of member governments to provide procedures and remedies under their domestic laws to ensure

that intellectual property rights can be effectively enforced by foreign rights-holders as well as by their own nationals. Governments have to provide for criminal procedures and penalties at least in cases of willful trademark counterfeiting or copyright piracy on a commercial scale, with remedies including imprisonment and fines sufficient to act as a deterrent. The agreement establishes a Council for TRIP Rights to monitor the operation of the agreement and governments' compliance with it. Dispute settlement takes place under the integrated GATT dispute-settlement procedures as revised during the Uruguay Round.

The Agreement on Trade-Related Aspects of Investment Measures (TRIMs) deals with investment issues thought to restrict and distort trade. It provides that no contracting party shall apply any TRIM inconsistent with Articles III (national treatment) and XI (prohibition of quantitative restrictions) of the GATT. An illustrative list of TRIMs includes measures against requiring particular levels of local procurement by an enterprise ('local content requirements') or measures that restrict the volume or value of imports an enterprise can purchase or use to an amount related to the level of products it exports ('trade-balancing requirements'). The agreement requires mandatory notification of all non-conforming TRIMs, and their elimination within two years for developed countries, five years for developing countries and seven years for least developed countries. It establishes a Committee on TRIMs that monitors the implementation of these commitments.

The agreement finalizing the Uruguay Round was signed in the Moroccan city of Marrakesh in 1994 and was, for the most part, routinely approved by the legislatures of member countries. (In the USA the president signed NAFTA and the Uruguay Round Agreements Act under 'fast-track authority' that minimized public or even congressional input.) The Uruguay Round vastly expanded the coverage of international trade agreements and greatly increased the power of the global institution responsible for regulating what were now movements of goods, services, ideas and capital. Under the WTO, ministerial meetings have subsequently been held at Singapore in 1996, Geneva, 1998, Seattle, 1999, and Doha, Qatar, in 2001.

The WTO

The WTO is headed by a Ministerial Conference that is supposed to meet at least every two years. Below this is the General Council,

normally made up of trade ambassadors and heads of delegations, but sometimes attended by officials sent by member counties to meetings held several times a year in Geneva. The General Council also meets as the Trade Policy Review Body (TPRB) and the Dispute Settlement Body (DSB). Some member countries participate in an Appellate Body, various Dispute Settlement panels, the Textiles Monitoring Body, and several multilateral committees. The WTO has procedures for resolving trade issues under the Dispute Settlement Understanding – under this, countries bring disputes to the WTO if they think their rights under agreements are being infringed, and judgments are made by specially appointed independent experts. Numerous specialized committees, working groups and working parties deal with individual agreements and other areas, such as the environment, development, membership application and regional trade agreements. Three other working groups deal with the relationship between trade and investment, the interaction between trade and competition policy, and transparency in government procurement. The existing councils and committees examine the area of electronic commerce. The WTO Secretariat, based in Geneva, has a staff of 550, mostly lawyers, and is headed by a director-general and a deputy director-general.

The 153 members of the WTO, as of 2008, account for almost 100 percent of world trade. Two-thirds of the members of the WTO are 'developing nations,' although the descriptions 'developed' and 'developing' are self-designations. Developing countries are granted longer time periods for implementing agreements and commitments. Legally the WTO votes differently than the IMF or World Bank – one country, one vote. But such a vote has never been taken. Instead decisions are made by consensus. WTO agreements have to be subsequently ratified by member states. Thus, when the USA agreed to WTO membership, Congress tacked on a special stipulation stating that if three or more issues were decided against the USA in the DSB in one year, the USA must opt out of the organization.

The WTO's declared objective is to 'help trade flow smoothly, freely, fairly and predictably.' It claims to do this neutrally, by administering trade agreements, acting as a forum for trade negotiations, helping to settle trade disputes, reviewing national trade policies, providing assistance to developing countries in trade policy issues through technical assistance and training programs, and cooperating with other international organizations. The WTO has been well described as follows:

> At a distance from the hurly-burly of domestic politics, government representatives and the WTO staff make significant decisions about international trade out of the public's view. It has no written bylaws, makes decisions by consensus, and has never taken a vote on any issue. It holds no public hearings, and in fact has never opened its processes to the public. Its meeting rooms do not even have a section for the public to observe its activities. And its court-like rulings are not made by US-style due process. Yet the WTO today rivals the World Bank and International Monetary Fund in global importance, because it has a dispute settlement mechanism with enforcement powers. (Wachtel 1998)

The WTO claims that its Secretariat does not have decision-making capacities like those granted to other international bureaucracies. Instead the Secretariat's duties include supplying technical support for the various councils and committees and the Ministerial Conferences, providing technical assistance for developing countries, analyzing world trade and explaining WTO affairs to the public and media. The Secretariat also provides legal assistance in the dispute settlement process and advises governments wishing to become members of the WTO.

WTO trade discourse

In terms of 'explaining WTO affairs to the public and media' the WTO claims ten benefits for the trading system it administers:

1. *The WTO/GATT system contributes to international peace*. Smoothly flowing trade helps people become better off; and more prosperous, contented people are less likely to fight.
2. *The system allows disputes to be handled constructively*. Nearly two hundred disputes have been brought to the WTO since 1995. Without a means of tackling these constructively and harmoniously, some could have led to more serious political conflicts.
3. *A system based on rules rather than power makes life easier for everyone*. Decisions in the WTO, made by consensus, with agreements ratified in all members' parliaments, apply to rich and poor countries alike. The result for smaller countries is increased bargaining power.
4. *Freer trade cuts the cost of living*. All people consume. The prices paid for food and clothing are affected by trade policies. Protectionism raises prices. By comparison, the WTO's global system lowers

trade barriers through negotiation and results in reduced costs of production, reduced prices of finished goods and services, and ultimately a lower cost of living.

5 *The system gives consumers more choice*, and a broader range of qualities to choose from. Even the quality of locally produced goods can improve because of competition from imports.

6 *Trade raises incomes*. Lowering trade barriers allows trade to increase, which adds to national and personal incomes. The WTO estimates that the 1994 Uruguay Round trade deal added between $109 billion and $510 billion to world income, depending on the assumptions behind the calculations.

7 *Trade stimulates economic growth* and that means more jobs. It is also true that some jobs are lost even when trade is expanding. But there are problems in reliably analyzing this. Some countries, however, are better at making the adjustment than others. Those without effective policies are missing an opportunity.

8 *The basic trading principles make the system economically more efficient and cut costs*. Trade allows a division of labor between countries and lets resources be used more effectively. But the WTO's trading system also further increases efficiency because, under WTO rules, governments charge the same duty rates on imports from all countries, and use the same regulations for all products, whether imported or locally produced. This makes life simpler for companies as sourcing components becomes more efficient and costs less.

9 *The system shields governments from narrow interests*. The GATT–WTO system helps governments take a more balanced view of trade policy. Governments are better placed to defend themselves against lobbying from narrow interest groups by focusing on trade-offs made in the interests of everyone in the economy.

10 *The system encourages good government*. Under WTO rules, once a commitment has been made to liberalize a sector of trade, it is difficult to reverse. The rules also discourage a range of unwise policies. For businesses, this means greater certainty and clarity about trading conditions. For governments it can often mean good discipline. (WTO n.d.: '10 benefits')

Taken as a whole, these ten benefits elaborating the basic position on trade, growth and incomes, laid out originally in GATT 1947 and updated by the WTO, constitute a coherent economic discourse, as

outlined earlier in this book. It is time to switch intellectual gears from a description of the GATT/WTO system to an extended critique.

Critique of the WTO

We must first deal with the WTO as an institution regulating the conditions of trade. The WTO presents itself as a neutral place where governments can make agreements about trade and resolve the disputes that inevitably arise in an equitable way. The WTO conveys the impression that member governments, meeting in the various councils and committees that convene under WTO auspices, make the basic decisions, and the organization merely carries them out. Yet as the ten benefits cited by the WTO, and listed above, clearly show, the organization does not adopt a neutral stance on trade policy. It is passionately against protectionism and just as profoundly for trade liberalization. The WTO says that it merely provides the forum within which countries decide how low barriers should fall and that it adjudicates the rules written into agreements on how liberalization takes place – that barriers be lowered gradually so that domestic producers can adjust, for instance, or that special provisions for developing countries be taken into account. Here, the WTO says, its objective is 'fair trade,' as in non-discrimination, or ensuring that conditions for trade are stable, predictable and transparent. In other words, the WTO's interpretation of 'fairness' is limited to the exact conditions under which free trade occurs – that countries follow the rules, act in transparent ways, and so on. With this narrow restriction, trade can operate 'fairly' under a system that more generally favors some interests while harming another.

Take, for example, the benefits and costs of trade. When it comes to evidence proving the growth and income benefits of the 1994 Uruguay Round, for instance, the WTO is satisfied with investigative methods that yield estimates of 'between $109 billion and $510 billion' added to world income, depending on the assumptions behind the calculations (see point 6 above). In other words, the WTO is willing to take dubious evidence (the higher figure being five times the lower!) as proof of the validity of a position on free trade's beneficial effects on growth and income. But when it comes to free trade's effects on workers and unemployment (point 7 in the list above), analytical problems suddenly emerge, so that reliable estimates become impossible and the issue can be deemed statistically non-resolvable, and thereby politely dropped. Well, not quite – on its website, the WTO also

addresses 'ten misunderstandings' of its own operations. It counters the 'misunderstanding' that the WTO 'destroys jobs and widens the gap between rich and poor' as follows: 'Not true: The accusation is inaccurate and simplistic. Trade can be a powerful force for creating jobs and reducing poverty. Often it does just that. Sometimes adjustments are necessary to deal with job losses, and here the picture is complicated. In any case, the alternative of protectionism is not the solution' (WTO n.d.: '10 common misunderstandings').

It then adds two supportive arguments: that in many cases, workers in export (trade-oriented) sectors of economies enjoy higher pay and have greater job security; and that among 'producers and their workers' who were previously protected by tariffs, but are now exposed to foreign competition, some survive by becoming more competitive, while others do not, and some workers adapt quickly, by finding new employment, while others take longer. So the consequences of free trade in creating unemployment depend on the worker's adaptability and the producer's competitiveness – how they respond to the 'challenge' of rapid change (challenge being the neoliberal euphemism for losing one's job), or more generally how the fittest survive – Social Darwinism in a brave new globalized world!

Yet global organizations, even when unelected, must seek mass approval. What aspect of the person (as worker, consumer, citizen, and so on) does the WTO side with? Under points 4, 5 and 6 above the WTO says that 'we are all consumers' and that 'we' benefit from free trade through higher personal incomes, lower prices, more choice, lower costs of living, and so on. This is a vision of societies as consumer, rather than worker, democracies, with consumption rather than labor as source of freedom – a nice, populist-consumerist addition to the overall neoliberal discourse. The general point is this: the WTO does not practice organizational, bureaucratic neutrality. As an organization it has a total commitment to a single, well-defined and elaborated, carefully defended, ideological position: free trade 'fairly adjudicated' that benefits people as consumers. In what follows, the WTO will be taken to be an organization with an ideological mission.

We can glimpse this mission in the choice of Michael Moore as director-general of the WTO between 1999 and 2002. Moore had been minister of external relations and trade in the New Zealand Labor government that came to power in 1984. That government, led by Prime Minister David Lange and Finance Minister Roger

Douglas, introduced a radical program of neoliberal restructuring that rapidly removed all restrictions on foreign investment, eliminated import controls, erased most tariff barriers, floated the New Zealand dollar and created an independent Reserve Bank with responsibility for controlling inflation, conducting extensive corporatization and privatization and radically restructuring the public service (Kelsey 1995). As a result, New Zealand went into a recession marked by the highest unemployment rates the country had seen since the 1930s depression. In 1990, with the Labor government in disarray, and on its way to a massive defeat in the November elections, Moore was installed as caretaker (or, rather, undertaker) prime minister by his party caucus, the third such leader within a year. Ousted as leader of the Labor Party in 1993, he has not repudiated the policies followed by the Lange/Douglas government and, until appointed to the WTO, was a core member of the right wing of the Labor Party in opposition. In his book *A Brief History of the Future*, Moore (1998: 71) says that 'the World Bank and International Monetary Fund (IMF) have unearned reputations born of the Cold War of being anti-poor, anti-developing countries … [but] no one believes that any more, except a few deranged misfits on the edges of obscure universities, people who tuck their shirts into their underpants, the remnants of pressure groups and a few geriatrics who claim that Marxism, like Christianity, has not been tried yet.' Despite this kind of right-wing diatribe (or perhaps because of it!) Moore was an active participant in international discussions on trade liberalization. As minister of overseas trade and marketing in the New Zealand government, he played a leading role in launching the Uruguay Round of GATT negotiations. He was a member of the 'International Eminent Persons Group on World Trade' (formed in 1989 to support the Uruguay Round) and he attended key GATT meetings in Punta del Este (1986), Montreal (1988), Brussels (1990) and Marrakesh (1994). And on 1 September 1999 Moore became director-general of the WTO – just in time for the debacle at Seattle, a fitting reward.

The main point, however, is not personalities but whether indeed trade produces economic growth and higher incomes for poor countries. The UNCTAD *Trade and Development Report* for 2002 addressed the question: why are developing countries trading more, yet earning less? The report notes that the past two decades have seen a rapid opening up to trade in developing countries. Indeed, trade volumes in developing countries have grown faster than the

world average. Developing countries now account for one-third of world merchandise trade, and much of the increase in trading volume has been in manufactures. The UNCTAD report notes, however, that this massive increase in exports has not added significantly to developing countries' income. Why, it asks, have developing countries not benefited from the increased openness to trade that in many cases is a condition for assistance from multilateral institutions? Many countries have been unable to shift production out of primary commodities such as agriculture and natural resources. The markets for these products have been stagnant and prices tended to go down in the long run (with the exception of fuel). Countries that shifted production from primary commodities to manufactures focused on resource-based, labor-intensive products, which generally lack dynamism in world markets and have a lower value-added. Reliance on exports of labor-intensive manufactures to galvanize growth in the face of declining commodity prices has been a common development policy. This led to many simultaneous export drives, causing falling prices and intense competition for foreign direct investment (FDI), and hence a weakened bargaining position for developing countries. As a result, developing countries end up competing with each other on the basis of wage levels. And these trends are occurring even while some of the larger countries, such as China, are yet to be fully integrated into the global trading system. At the same time developed countries have themselves liberalized trade slowly and insufficiently in the area of clothing, textiles and other labor-intensive manufactures. Along with trade liberalization, the last two decades have also seen substantial increases in flows of foreign direct investment. Success in attracting large amounts of FDI, however, has not necessarily resulted in greater growth. Mexico, for example, has experienced massive FDI in the last few years and a corresponding increase in exports. GDP per capita has not, however, risen in response. In contrast, Taiwan (with more state intervention in planning the direction taken by the economy) has seen lower levels of FDI and has been selective and more focused on building domestic investment. Here we have seen growth in exports and a corresponding growth in GDP. UNCTAD concludes that the liberalization of trade and FDI should no longer be the sole focus of development agencies. Instead, developing countries, and the development agencies that impose conditionalities on them, should ensure that trade policies are designed to maximize domestic growth and development – which may not involve reducing external barriers

(UNCTAD 2000). In other words, the basic argument made for free trade by the WTO turns out not to be proven in the developing-country experience.

Critique of trade policy review

As part of the Marrakesh agreement, the Trade Policy Review Mechanism (TPRM), originally set up under the GATT in 1989, was confirmed as an integral component of the WTO. The purpose of the TPRM, according to the WTO, is 'to contribute to improved adherence by all Members to rules, disciplines and commitments made under the … Agreements' and hence to making the trading system function more smoothly 'by achieving greater transparency in, and understanding of, the trade policies and practices of Members.' Through trade policy reviews, members of the WTO 'undertake the regular collective appreciation of the trade policies and practices of trading partners' – that is, the whole membership of the WTO discusses the trade policy of each member government at regular intervals (every two years for the largest countries, less regularly for smaller countries). A Trade Policy Review Body (TPRB) made up of the WTO General Council, operating under special rules and procedures, and open to all member countries, elects a chairperson to supervise the process and summarize its results. Reviews are 'set against the background' of the country's wider economic policies. For each review, two main documents are prepared: a policy statement by the government of the member country under review; and a detailed report written independently by the Trade Policy Review Division (TPRD) of the WTO Secretariat, based on information from the country, but also using material from other sources that the Secretariat finds appropriate. The process includes a visit by a Secretariat team (two or three staff members of the TPRD) to the country under review, where they consult with governmental agencies, chambers of commerce, research institutes and other elite organizations. The TPRD 'assists' small, developing countries in preparing for a trade policy review. This is described as an onerous process that nevertheless 'encourages' trade policy-making in directions foreseen in the WTO agreements which contribute to a member country's 'greater integration into the multilateral trading system.' Trade policy reviews cover all aspects of the country's trade policies, including its domestic laws and regulations, the institutional framework, bilateral, regional and other preferential agreements, wider economic needs and

external (socio-economic) environment. The two documents are then discussed by the WTO's full membership in the TPRB, employing two discussants advised by the TPRD Secretariat, and with other intergovernmental organizations (IMF, World Bank, OECD, UNCTAD) attending as observers. The process ends with summary observations by the Secretariat and concluding remarks by the chairperson of the TPRB, with all documents eventually being published (WTO).

As described by the WTO Secretariat, trade policy review appears to be a helpful, democratic process, using procedures that come close to resembling a neutral socio-political scientific endeavor. Yet within the discursive space of a center of power, phrases such as 'encourage,' 'assist' and 'collectively appreciate' suggest something more than a neutral review, something more like disciplining, directing, prompting and even warning countries that they should adhere to a given line so they can be 'more integrated' into the multilateral trading system administered by the WTO – which, by the way, is the only game in town, or, in the case of international trade, the only game in the world. With this suspicion raised, let us look at a case example in some detail – the TPRB's third review of Brazil's trade policies, with meetings held at the WTO on 30 October and 1 November 2000.

The Brazilian delegation's report to the TPRB discussed how its trade policy was directed at minimizing the risks of globalization and maximizing opportunities for the national socio-economic development effort. Adjusting the Brazilian economy to the new international context had been translated, on the domestic front, into processes of deregulation and privatization of the economy. And the opening of the Brazilian economy, implemented throughout the 1990s, had led to undeniable benefits in the areas of modernization, productivity and competitiveness. But Brazil's delegation complained that opening up the economy had also generated a significant growth in imports. The sustainability of this process would require, in the long term, a corresponding access to foreign markets for Brazilian goods and services. And while the successive GATT negotiation rounds had produced a significant reduction of tariff levels, a number of sophisticated, and not entirely transparent, non-tariff measures and regulations on the parts of most developed countries were major restrictions to international market access. Developing countries, Brazil complained, still faced discrimination in terms of market access, especially for their agricultural products. The process of broad market opening undertaken by Brazil since the beginning of the 1990s had not resulted

in commensurate access to foreign markets, and this situation was reflected in large trade deficits with the European Union, the USA and Japan. On behalf of Third World countries, Brazil complained of problems deriving from the implementation of trade policies and practices, declared very often on a unilateral basis, by developed countries, which had an adverse impact on balance of trade relations at the international level. (All this proved prescient when Brazil experienced significant currency and balance of payments problems two years later – see Chapter 4.)

By comparison, the TPRD Secretariat report on Brazil mentioned none of this. It 'congratulated' Brazil for continuing a program of economic reform, initiated over a decade ago, that had led to more open trade and investment regimes. A more market-driven, decentralized environment had emerged through the deregulation of state monopolies and prices, investment liberalization and privatization. The Secretariat thought that this 'must have' resulted in improved resource allocation and greater flexibility that helped the Brazilian economy deal successfully with external and other shocks facilitating, in particular, rapid recovery from the financial crisis that led to the floating of the Brazilian currency, the real, in 1999 (again, remember the 2002 Brazilian crisis). And the Secretariat thought that market-set exchange rates would now provide the opportunity for Brazil to reduce, and perhaps remove, some measures taken to restrict imports or support exports, and to make a definitive break from the last remaining traces of its inward-looking policies of the past.

The TPRB chairperson's 'summary' of the entire review said that members attributed Brazil's recovery from the financial crises in 1997 and 1998 largely to 'sound macroeconomic policies' and liberalization pursued over the last decade, both unilaterally and in the context of international agreements. Greater exposure to competition from foreign goods and services had helped contain inflation, had enhanced productivity and competitiveness and had attracted foreign investment. Members 'recognized' that, as a result, Brazil had now moved unequivocally away from the import substitution model it had used in earlier years. Members of the TPRB, the chairperson said, 'commended' Brazil for its active participation in the multilateral trading system, with several 'welcoming' its support for the launching of a new round of trade negotiations. Members observed 'with concern,' the chairperson added, that since Brazil's last trade policy review in 1996 the average MFN tariff had risen to 13.7 percent as a result of

Box 5.1 Trade policy review by the WTO

Excerpts from TPRB chairperson's summary remarks

TPRB review of the Philippines, September 1999 Members warmly commended the Philippines on the economic reforms undertaken since its previous Review in 1993. The opening of the trade and investment regimes has contributed to a more resilient economy which, in general, had dealt well with the Asian financial crisis and natural disasters. The Philippines thus provides a good example of the advantages of structural reform, particularly trade liberalization, in withstanding external shocks. Continued efforts to enhance the outward orientation of the economy would bring further benefits to Filipino workers and consumers. Members encouraged the Philippines to continue on its liberalization path and domestic reform process …

TPRB review of Poland, July 2000 Members were clearly impressed by Poland's economic transformation to a market economy. The economy is performing robustly and future growth prospects are favorable. This has been achieved by generally prudent macroeconomic policies combined with structural reforms, particularly trade and investment liberalization. Members acknowledged the remarkable results of the Polish transition process, including in the privatization of state-owned enterprises; this has undoubtedly played a significant role in attracting foreign investment. Members also appreciated Poland's overall commitment to liberal trade and investment policies.

TPRB review of Korea, September 2000 Members were impressed by Korea's strong and swift recovery from the 1997 crisis and recognized that this recovery was largely the result of prudent macroeconomic policies and far-reaching structural reforms. In addressing the crisis, Korea had, by and large, eschewed protectionist measures and had instead taken steps to further improve the competitive environment both through domestic reform, particularly in the corporate, financial and labor spheres, and through trade and investment liberalization. Members urged Korea to reduce state involvement and facilitate foreign participation in several sectors.

TPRB review of Mozambique, January 2001 Members were very impressed by the excellent economic performance of Mozambique in recent years, attributing this to its economic reforms, including privatization of enterprises, the elimination of most export restrictions and of exchange controls, and simplification of its customs tariff.

TPRB review of Ghana, February 2001 Members were heartened by Ghana's commitment to freer trade and economic reform … welcomed continued efforts to open its market by refraining from using non-tariff measures and relying on tariffs as the main instrument of trade protection. The central role to be played by trade, investment and the private sector in Ghana's economic restructuring and improving its international competitiveness was widely recognized, and Ghana was urged to pursue further liberalization. Revitalization of the privatization program was also encouraged. While appreciating Ghana's efforts, Members highlighted the urgent need to restore macroeconomic stability through sound fiscal and monetary policies.

TPRB review of Costa Rica, May 2001 Members were all favorably impressed by Costa Rica's good economic performance in recent years. They noted that underlying this performance was Costa Rica's generally liberal trade regime, open investment environment and successful strategy to shift production toward manufacturing, notably into export industries. Costa Rica is a prime example of how small WTO economies may benefit from trade liberalization and the multilateral trading system.

Source: WTO

temporary tariff increases; they 'took note of Brazil's reassurances' that the increase would be eliminated at the end of the year. Questions were also 'raised' about non-tariff measures, many focusing on Brazil's customs valuation and the role of minimum prices, as well as on a non-automatic import licensing regime. After 'expressing a number of other concerns' raised by members, the chairperson concluded that the review had met the vision for the TPRM, and that discussion had enhanced transparency and understanding of Brazil's trade

policies and practices through a collaborative quest. Members were 'appreciative' of Brazil's efforts to implement wide-ranging economic reforms and 'encouraged' it to continue down this path.

We might continue by looking in detail at a number of other 'fair, open discussions aimed at transparency and clarification' in a forum where 'members of the organization can comment freely on the trade and economic policies of any country.' Box 5.1 summarizes a number of trade reviews conducted by the TPRB in the period 1999–2001.

Clearly, far more than reviews of trade policy are involved. These are WTO assessments of the entire system of economic policies pursued by governments made under conditions of power and duress, in that continued membership means continuing access to MFN status (that is, the lowest import duties available in markets such as the USA). The summaries show that policy prescriptions coming from the TPRB *always* follow the same model, using a nearly identical language. In their depositions, member countries of the WTO may present vaguely phrased objections to the existing free trade regime. They may hint, as with Brazil, that they are merely doing their best to adapt to the 'objective conditions' of globalization. These demure complaints are then politely ignored as discussion is phrased exclusively in neoliberal terms. In this neoliberal model, 'good' is represented by optimistic phrases such as: openness, liberalization, export orientation, structural reform, deregulation, privatization, competitiveness, macroeconomic soundness, stability, flexibility, simplification, prudence and, best of all, 'rationalization' – that is, determination of the direction taken by an economy by purely market processes, including random chance and competitive, speculative upheaval! Bad is represented by pessimistic phrases such as protection, closed, controlled, restriction, subsidy, tariff, inward-looking, import substitution and, most of all, direction of the economy through state regulation. Billed as 'peer-group assessments,' the WTO trade policy reviews are more like peer group pressure, examinations, conducted by expert trade representatives, of the economic policies of the member countries, within a disciplinary lexicon phrased in the polite terms of economic diplomacy – members 'congratulating' countries and 'welcoming' measures taken, but always in one direction, always that of liberalization, while 'expressing concern' and 'raising questions' about tendencies in other directions, always those of national state regulation. A process that always reaches the same model conclusion turns the meaning of 'open' discussion into its opposite, 'closed

prescription.' The model country showing others their future is the USA, described by its own 1999 trade policy review as 'among the most open and transparent [economies] in the world' – despite massive state subsidization of agriculture which enables low-priced exports that ruin millions of small farmers in countries forced by the WTO to open their borders 'freely' to imports. Countries are pressured to adhere to a process that yields a single end point, the 'open' and 'liberalized' economy that supposedly fits the US model, but in fact fits an idealized, right-wing, neoliberal model. On top of all this, the WTO Secretariat earnestly characterizes itself as merely doing the 'factual leg-work' and providing 'technical assistance' and 'training' to poor Third World countries facing a daunting review procedure. Fact and technique, assistance and training, all these are code-words for political-economic disciplining (Foucault stirs in his urn). The trade policy reports of the TPRB are documents of disciplinary power, and the fifteen or so 'professionals' of the TPRB wield more economic clout than the thousands of policy-makers in the finance ministries of member countries, who in turn control the destinies of billions of people. Through the TPRB, the WTO serves as an international court of economic opinion, with neoliberalism as the norm against which policies are judged.

Trade and environment

The purpose of the WTO is to liberalize trade across national boundaries – that is, to remove governmental restrictions on the free movement of goods and services. But 'restrictions on trade' may include local state, national or international regulations to protect the environment, ensure food quality and safeguard public health. What happens when the WTO's imperative for freeing trade from governmental restriction conflicts with the need for environmental protection in an age of burgeoning production, massive consumption and the use of powerful technologies?

The WTO insists that it is not an anti-environmental organization. It points to 'several references to the environment' actually made in the organization's provisions. Thus the preamble to the Marrakesh Agreement says that the purpose of the WTO is to expand member countries' production and trade in goods and services while 'allowing for the optimal use of the world's resources in accordance with the objective of sustainable development.' Additionally, the WTO says, Article XX of GATT, dealing with 'General Exceptions,' specifies a

number of instances, including cases of environmental protection, in which member countries may be excepted from the usual trade rules. The WTO also refers to the Agreement on Technical Barriers to Trade and the Agreement on Sanitary and Phytosanitary Measures, two closely linked health and safety agreements emerging from the Uruguay Round. These need explaining in a little more detail.

The WTO Agreement on Technical Barriers to Trade (TBT) tries to ensure that technical regulations and standards, and their testing and certification procedures, do not create unnecessary obstacles to trade. In its preamble, the agreement recognizes countries' rights to adopt such safety measures to the extent they consider appropriate – for example, to protect human, animal or plant life or health, or to protect the environment. Members are allowed to take measures to ensure that their standards of protection are met – this is known as adopting 'conformity assessment procedures.' Among the agreement's important features are: non-discrimination in the preparation, adoption and application of technical regulations, standards and conformity assessment procedures; avoiding unnecessary obstacles to trade; adopting international standards as far as possible; and the transparency of these measures, through governments notifying the WTO Secretariat and establishing national enquiry points. In brief, the TBT agreement allows countries to adopt technical regulations, standards and conformity assessment procedures to safeguard human and animal health and the environment, provided non-discrimination, transparency and other requirements are met.

The Agreement on Sanitary and Phytosanitary Measures (SPS) – 'phyto' referring to plants – is similar in that it deals with human, animal and plant health and food safety regulations. It recognizes members' rights to adopt SPS measures, but stipulates that these must be based on science, should not create unnecessary obstacles to trade, and should not arbitrarily or unjustifiably discriminate between members where similar conditions prevail. The agreement encourages members to adapt their SPS measures to the areas (regions, countries or parts of countries) that supply their imports (WTO n.d.: 'Agreement').

The WTO relies on three international bodies to set standards for the TBT and SPS agreements: for food standards, the Codex Alimentarius Commission (Codex), created in 1963 and run jointly by the UN Food and Agriculture Organization (FAO) and the World Health Organization (WHO), whose main purpose is protecting the health

of consumers, ensuring fair practices in food trade and promoting coordination of food standards work undertaken by international governmental and non-governmental organizations; for animal health, the International Office of Epizootics, an intergovernmental organization that informs governments about animal diseases and harmonizes regulations for trade in animals and animal products; and for plant issues, the Secretariat of the International Plant Protection Convention, a multilateral treaty deposited with the FAO, which tries to prevent the spread of plant diseases and acts as a source for international standards for phytosanitary measures affecting trade.

Additionally, the WTO says that, long ago, it established special committees on trade and environmental issues. And indeed, in 1971, the GATT Council of Representatives agreed to set up a Group on Environmental Measures and International Trade that would convene at the request of GATT members. No country asked that it convene until 1991, however. A somewhat more active group, the Committee on Trade and Environment (CTE), came into existence along with the WTO in 1995. Its mandate is: 'to identify the relationship between trade measures and environmental measures in order to promote sustainable development; and to make appropriate recommendations on whether any modifications of the provisions of the multilateral trading system are required, compatible with the open, equitable and non-discriminatory nature of the system' (WTO n.d.: 'The WTO and its Committee on Trade and Environment'). In its statement of the basic principles that guide its work, the CTE points out that the WTO is not an environmental protection agency and that its competency is limited to aspects of environmental policies related to trade. This competency, however, includes looking at 'how trade policy can benefit the environment.' The committee says that the WTO is interested in building a 'constructive relationship' between trade and environmental concerns in order to promote sustainable development, without undermining its open, equitable and non-discriminatory character.

The WTO holds symposia on trade, environment and sustainable development in Geneva, involving senior trade and environment officials together with representatives of selected NGOs. Likewise, the WTO Secretariat organizes a series of regional seminars on trade and environment for government officials, the objective being 'to raise awareness on the linkages between trade, environment and sustainable development, and to enhance the dialog among policy-makers from different ministries in WTO member governments' (WTO n.d.: 'Work

of the Trade and Environment Committee'). At these seminars, the basic argument originally propagated by the GATT, and elaborated by the WTO, is that trade benefits the environment. Expanding trade and increased market access, the argument goes, lead to larger per capita incomes that, in turn, provide more resources to contain environmental damage. If the average citizen can also be convinced of the need to devote more material and human resources to achieving a better environment as incomes rise, the growth of per capita income ultimately leads to increased expenditures on the environment. A country with a stagnant economy, by contrast, tends to spend less on improving the environment. Furthermore, new technologies often appear first in countries at the frontier of environmental regulation, and products embodying these technologies have to be exported if other countries are to catch up. Similarly, trade can help consumers make environmentally beneficial choices – for instance, imports of low-sulfur coal could discourage the use of polluting high-sulfur coal. Trade in recycled inputs can help countries economize on resource use (GATT Secretariat 1992).

A new WTO Secretariat report on trade and environment, the longest and most sophisticated of all, was released in 1999, again just before the Seattle ministerial meetings. The report argued that most environmental problems resulted from polluting production processes, certain kinds of consumption and the disposal of waste products – trade as such was rarely the root cause of environmental degradation, except for the pollution associated with the transportation of goods. The key question was this: is economic growth, driven by trade, part of the environmental problem or part of the solution? The WTO Secretariat report provided a complicated answer. But on the whole it argued that low incomes were one reason that environmental protection lagged in many countries. Here the report referred to the notion of an Environmental Kuznets Curve (EKC) – the idea of an inverted U-shape pollution path taken by countries undergoing economic growth. Pollution increases at early stages of growth, but decreases after a certain income level has been reached. Trade entered into this debate for several reasons: trade was one of the cylinders propelling the engine of growth; trade might affect the shape and relevance of the EKC; competitive pressures might prevent environmental standards from being upgraded; and growth driven by liberalization of the world economy might then prevent the onset of mechanisms that could generate an environmental Kuznets curve. Countries that lived on the

margin might not be able to afford to set aside resources for pollution abatement, nor did many think they should sacrifice their growth prospects to help solve global pollution problems caused in large part by the consuming lifestyles of richer countries. So, if poverty was at the core of the pollution problem, economic growth would be part of the solution – this was because growth allowed countries to shift gear from immediate concerns to long-term sustainability issues. National accountability, good governance and a democratic political process should also not be underestimated. Good governance was also needed at the international level – the 1987 Montreal Protocol and the Kyoto Agreement were cited as examples. The growing number of multilateral environmental agreements (MEAs, currently 216 in number) might be a further indication of the trend in that direction. Initiative might have to shift from the national to the supranational level. The cooperative system of the WTO, based on legal rights and obligations, could potentially serve as a model for a new global architecture of environmental cooperation. The way forward, it seemed, was to strengthen the mechanisms and institutions for multilateral environmental cooperation, just as countries, fifty years ago, decided that it was to their benefit to cooperate on trade matters by forming GATT (Nordstrom and Vaughan 1992).

These are sophisticated arguments indicating that the WTO takes seriously protests by environmental social movements. Its director-general said that the WTO's Doha Round was the first ever to include a 'green chapter' (Lamy 2007). We have seen earlier that the WTO claims that liberalizing trade leads to higher GDP levels, higher incomes and especially more consumption, by freeing production from trade restrictions. Indeed, 'change in the scale of economic activity' in an upward direction and more consumption choices are *the* main benefits the WTO claims for the broad mass of the world's people. But this creates a dilemma when it comes to the effects of production on the environment. For if, indeed, the WTO trading system generates growth, and growth is accompanied by pollution, then the trading system championed by the WTO generates pollution. The trade and growth policies of the WTO can be held accountable for the environmental destruction wrought by higher production and consumption levels. This is particularly the case when the increased international competitiveness favored by a liberalized WTO trading system reduces the political and economic ability of the national and local state to environmentally regulate production. Indeed, this

counter-argument is so compelling that the WTO, through its 1999 report, for instance, has to address the relations among trade, growth and environmental degradation previously so neglected that its committee on trade and environment had never met. On the one side, the WTO agues that trade-induced growth provides the resources to address environmental problems (or, rather, environmental 'challenges' – the shift in terms reveals a guilty conscience). On the other side, when it comes to environmental degradation, neither trade nor growth is a root cause. Instead, the root cause of environmental degradation is pollution. Most environmental problems result from polluting production processes that can be effectively regulated, even in the face of increased competitiveness, by national environmental policy and, with globalization, through MEAs – the 1999 report uses as examples the Montreal Protocol and the Kyoto Accords on greenhouse gas emissions and global warming, and it is often mentioned that the GATT and the WTO supported the Rio Declaration on the global environment. Notice here the logical ellipses, and the attempt at turning critique into supportive claim.

In the first ellipse, the WTO denies that trade-induced economic growth is the basic causal condition for the increased pollution that causes dangerous levels of environmental degradation; yet the WTO claims that trade-induced growth is definitely part of the solution. This is a case of denying you caused that bite-shaped hole in the cake, but spitting a bit back to fill the gap! The WTO relies on the dubious notion of an EKC in which pollution decreases after a certain point as incomes rise in growing economies. But this finding has been hotly contested. For example, one study used data on ambient air pollution in cities worldwide to examine the relationship between national income and pollution. It concludes that there is little empirical support for an inverted U-shaped relationship between several important air pollutants and national incomes (Harbaugh et al. 2000). Another study on sulfur emissions, using a larger and more globally representative sample than previous sulfur EKC studies, finds that sulfur emissions per capita are a monotonic function of income per capita when a global sample of countries is used, but an inverted U-shape function of income when a sample of *only* high-income countries is used – that is, the U-shape findings occur only when a certain set of already developed countries is chosen (Stern and Common 2001). For us, even a casual glance at the pollution data demonstrates one undeniable fact about environmental destruction.

The main cause of pollution is not population pressure, as claimed by organizations such as the World Resources Institute (itself in desperate need of a deconstructive critique), nor is it poverty, as the WTO more perniciously claims. Instead the advanced countries spend more on environmental programs because their affluence and their huge production/consumption social machines cause the environmental problem in the first place. (Note here, as a side issue, the WTO's tendency to blame the victims for environmental problems in that poor countries lack the financial resources to follow the lead of the advanced countries in cleaning up environmental pollution.) Taking one key indicator in an area of pollution – carbon dioxide emissions – mentioned prominently by the WTO: the high-income countries, with 15 percent of the world's population, generate (within their borders) 47 percent of global emissions, because for each person 12 tons of carbon dioxide are emitted annually; whereas the low-income ('poor') countries of the world, with 40 percent of the world's population, generate 11 percent of emissions because for each person 1 ton of carbon dioxide is emitted. And further, middle-income countries, following an export-oriented industrialization model of growth of the type advocated by the WTO (that is, also producing for the markets of the rich countries) show rapidly increasing levels of carbon dioxide emissions (World Bank 2000c: 278–9, 292–3). In brief, the single, most prominent cause of global pollution is the same process of trade-oriented, unregulated global industrialization that the WTO wants further to deregulate through 'liberalization.'

In the second ellipse, the WTO claims that despite the increased international competitiveness brought on by the liberalization of trade, governments can, through multilateral agreement, implement effective environmental regulations. This shunts responsibility for environmental destruction away from liberalized trade, and places the onus squarely on government policies. (Notice also that these are always 'clean-up policies' rather than preventive policies.) It also substitutes vague, wishful thinking for concrete, real environmental action. The WTO favors the notion of 'sustainable development' proclaimed by the Declaration on Environment and Development at the United Nations Conference on Environment and Development, in Rio de Janeiro, 1992, a conference in which the GATT actively participated. The key position established by the Rio Declaration summarized by its Principle 7 says: 'States shall cooperate in a spirit of global partnership to conserve, protect and restore the health and

integrity of the Earth's ecosystem.' The Declaration goes on to suggest that to achieve sustainable development and a higher quality of life for all people 'States should reduce and eliminate unsustainable patterns of production and consumption and promote appropriate demographic policies.' Under Principle 12, the Rio Declaration follows the lead of the GATT by saying that:

> States should cooperate to promote a supportive and open international economic system that would lead to economic growth and sustainable development in all countries, to better address the problems of environmental degradation. Trade policy measures for environmental purposes should not constitute a means of arbitrary or unjustifiable discrimination or a disguised restriction on international trade. Unilateral actions to deal with environmental challenges outside the jurisdiction of the importing country should be avoided. Environmental measures addressing transboundary or global environmental problems should, as far as possible, be based on an international consensus. (CIESIN 1992)

The Rio Declaration sets up a fine-sounding ideal in the form of a loose, malleable objective defined by the term 'sustainable development.' Yet the Declaration advocates 'cooperation in good faith and in a spirit of partnership' with the means for carrying this out left for 'the further development of international law in the field of sustainable development' – that is, the means of implementation are to be worked out some time in the future. Population growth (in Third World countries) features prominently as the basic cause of environmental pollution rather than economic growth or overconsumption. And further still, the GATT managed to insert its own position into the Declaration in one of its few more exact statements, the notion that unilateral trade action should not be used to address environmental problems but instead measures must be based on 'international consensus' – should that, one day, maybe, if 'we all work together,' perhaps, occur!

In terms of reducing pollution through multinational environmental agreements the WTO mentions the Montreal Protocol and the Kyoto Accords. The Montreal Protocol on Substances that Deplete the Ozone Layer, agreed upon in 1987 after 'rigorous negotiations,' sets the 'elimination' of ozone-depleting substances as its 'final objective' and was ratified by countries accounting for 82 percent of world consumption. Yet the Kyoto treaty, signed by 100 countries in 1997,

mandating that the USA and other industrialized nations 'find a way' by the year 2012 to reduce greenhouse gas emissions by between 5 percent and 7 percent of 1990 levels, and often described as 'the only practical measure we have to tackle climate change,' was specifically rejected by the US G. W. Bush administration, in March 2001, on the grounds that it damaged the American economy, excused developing countries from decreasing emissions, and that the scientific evidence on global warming remained unclear – all this despite the fact that, according to a *Time*–CNN poll released soon afterward, a huge majority of Americans see global warming to be a serious problem, believing three to one that carbon dioxide emissions help account for global warming, with two-thirds wanting Bush to find a way to reduce such emissions. In brief the WTO places responsibility for environmental action on vague MEAs that, when specified in terms even of objectives such as limiting emissions to the already dangerous levels reached in 1990, are rejected by trade- and growth-oriented administrations. In other words, the WTO is a global growth machine, and international environmental policy is its thin disguise.

Furthermore, the WTO takes the position that its decisions rest on the basis of 'scientific expertise.' We mentioned earlier that the goal of the TBT agreements is to harmonize product standards, packaging provisions and safety requirements with the aim of eliminating unnecessary trade obstacles. The SPS covers measures applied to protecting animal or plant life from disease and disease-carrying or -causing organisms, toxins, pests and the like. There are two genres of harmonization: (1) product standards, meaning the characteristics of a good; and (2) process standards, or the way in which the good was produced. In several instances, the WTO has granted exemptions for product standards, but not process standards. Under the TBT and SPS Agreements, the WTO uses product standards set by the Codex Alimentarius Commission (Codex) to adjudicate important trade issues dealing with food issues (WTO 1998). The very name 'Codex Alimentarius Commission' suggests scientific judgment beyond reproach and seems to vindicate the WTO's claim that its findings rest on science. Yet Codex meetings are heavily influenced by the food industry. Large food corporations have identified Codex as a critical target to influence, either through lobbying the body itself, or by having their interests represented by government delegations. The official, governmental delegations sent to the Codex meetings include many industry representatives – 40 percent of the delegates in

the case of the USA, for instance. In a report to the president of the European Commission in 1999 one observer of the Codex committee meetings discussing standards on the cattle growth hormone rbST stated: 'The ways and means by which rbST was re-evaluated last year strengthens our belief that powerful politico-economic interests and multinational companies exercise improper influence and control in the work of Codex Alimentarius and its scientific committees whose supposed primary task is to protect human health' (Food Magazine 1999: 2).

Once accepted by Codex, a standard becomes extremely difficult for national governments to override – by setting higher standards, for instance. Governments able to produce scientific evidence to support their case might be able to argue for higher standards. Final judgment on the evidence, however, is made by a WTO dispute settlement panel. If there is scientific uncertainty, as is often the case with the potential long-term health effects of food production processes, for example, the WTO system prevents national governments from adopting the precautionary principle and regulating trade. Yet the Codex standards for food trade are low, by comparison with those set by regional groups of countries, such as the European Union, even allowing for residues of artificial hormones in beef (Wallach and Sforza 1999: 56). Codex standards allow DDT residues to be fifty times greater than allowed by US law (Korten 1995: 179), and Codex is considering a standard that would allow for higher amounts of lead and other contaminants in mineral water (Wallach and Sforza 1999: 73). The main point is this: the notion that the WTO makes fair judgments based on issues relating to trade, the environment, food issues and the like, based on neutral scientific evidence provided by experts beyond question or reproach, is a figment of the imagination. Instead, the WTO makes anti-environmental judgments biased by its guiding principles of the 'liberalization' of trade and disguises them as fair, equitable and based in the neutral principles of science.

A confidential document from the WTO Secretariat dated 19 March 2001 obtained by Greg Palast, a journalist at the *Guardian* and the *Observer*, two British newspapers, discusses Article VI.4 of the GATS agreement. It addresses the balance between two potentially conflicting priorities: promoting trade expansion versus protecting the regulatory rights of governments. Under the GATS treaty, Article VI.4, known as the Necessity Test, the GATS Disputes Panel will determine whether a national or state law or regulation is 'more burdensome than

necessary' to trade. A similar Necessity Test, included in NAFTA, has recently been applied to the state of California's banning of a gasoline additive, methyl tertiary butyl ether (MBTE), which has leaked from gasoline storage tanks and contaminated water supplies. A Canadian seller of the 'M' chemical in MBTE filed a complaint with NAFTA saying that the rule fails the Necessity Test, in that the state could require all service stations to dig up their storage tanks, reseal them and inspect the results. This would be the least trade-restrictive method for protecting the water supply – 'least trade-restrictive' being NAFTA's Necessity Test. If California does not drop its ban on MBTE, the US Treasury may have to compensate the Canadian chemical firm to the extent of $976 million. Likewise, under the GATS, as described in the Secretariat memo, national regulations will be struck down if they are 'more burdensome than necessary' to business. The notion of 'safeguarding the public interest' is to be rejected in cases brought before GATS tribunals and primacy is to be given instead to the principle of 'economic efficiency.' Under the GATS, the Disputes Panel will decide whether national laws or regulations serve 'legitimate objectives' (Palast 2001b).

We have saved the best for last, however. The WTO makes the audacious claim that the GATT/WTO agreements on trade, together with the WTO dispute settlement system, provide an effective model for enforceable international environmental regulation. From this, the WTO miraculously moves from environmental savage to environmental savior. Such a claim can be examined only through the practice of an institution – in the sense that deeds speak more truthfully than claims. The WTO's practice in this area occurs mainly through the settlement of disputes among member governments about conflicts between issues of trade and issues of environment. Briefly, the dispute settlement system starts when member governments bring conflicts over trade, largely different interpretations of the Articles of Agreement, to the WTO. Should consultation not result in settlement, the WTO's Dispute Settlement Understanding (DSU) requires the establishment of an investigative panel, normally consisting of three persons of 'appropriate background and experience' proposed by the WTO Secretariat or the director-general, from countries not party to the dispute. Panel reports are adopted by the WTO Dispute Settlement Body (DSB), unless the DSB decides by consensus not to adopt the report, or one of the parties notifies the DSB of its intention to appeal. Appeals are handled by a WTO Appellate Board made up of

three of the seven (semi-permanent) members of the WTO Appellate Body. Appeals are limited to issues of law covered in the panel report and legal interpretations developed by the panel. The resulting report is then adopted by the DSB and unconditionally accepted by the disputing parties, unless the DSB decides by consensus against its adoption. Once the panel report or the Appellate Body report is adopted, the government found against has to notify the WTO of its intentions with respect to implementing the adopted recommendations. The DSB keeps implementation under regular surveillance until the issue is resolved, with rules set for compensation, or the suspension of trade concessions in the event of non-implementation.

In DSB cases concerning trade and the environment, intergovernmental disputes have focused on Article XX of the 1947 GATT Agreement. This allows exceptions from the other articles of the agreement dealing with the rules governing trade, for measures: necessary to protect human, animal or plant life or health (sub-section b); and relating to the conservation of exhaustible natural resources (sub-section g), subject to the requirement that these measures are not applied in a manner which would constitute a means of arbitrary or unjustifiable discrimination between countries where the same conditions prevail, or a disguised restriction on international trade. We looked in detail at the seven cases from the records of the DSB dealing with Article XX in the period 1982–99 (Nordstrom and Vaughan 1992: 81–4). We found that when issues essentially of free trade, on the one hand, and environmental regulation, on the other, come into conflict, the GATT/WTO dispute system always found in favor of trade, and against national environmental regulation. There might be a partial exception to this. In an eighth environmental case, the Shrimp–Turtle case, the WTO dispute settlement system again found several times in favor of trade (WTO 2001a). But in this case the government requesting an exception under Article XX, the USA, made extensive efforts to comply with a series of findings by the WTO's Panel and Appellate Board. In particular, the USA under the Clinton administration made a sustained attempt, which would be difficult to replicate, especially under more right-wing administrations, to comply with the WTO's conception of MEAs. For example, a regional agreement between twenty-four countries was tentatively agreed upon in Kuantan, Malaysia, in July 2000, dealing with the conservation of sea turtles, with the USA actively participating. Even more importantly, the panel's finding came after massive environmental criticism of the

WTO, by demonstrators dressed as turtles, at its Seattle ministerial meeting. (One newspaper account described them as Ninja Turtles!) Yet even this, the panel's decision, was the most tentative finding that could be imagined for environmental exemption under Article XX: in its summation, the panel noted that should any one of its conditions cease to be met in the future, the recommendations of the DSB might no longer be complied with. In other words, in the entire history of GATT/WTO disputes, the WTO has very tentatively allowed one, single exception that conserves environmental resources under Article XX, in this case conservation of an endangered species, under the condition that its trade-oriented rules be strictly followed.

As important as these findings may be, we might look at the method used to conduct such inquiries. Under the GATT/WTO Dispute Settlement Understanding, panel proceedings are confidential. People who are not parties, or third parties, to the dispute are not permitted to attend panel proceedings, nor are transcripts made available. Only the panel's final report, or the Appellate Body report, together with some non-confidential summaries, is publicly released, after the case is over. Moreover, the panelists are selected essentially from Geneva-based officials, ambassadors to the WTO, trade advisors to government trade ministries or academic specialists in trade law and policy, but never environmentalists, usually from an 'indicative list' maintained by the WTO Secretariat. For example, several key decisions on trade and the environment were made by panels chaired by Michael D. Cartland, formerly financial services and economic analysis secretary to the Hong Kong government, and its trade representative to the GATT. The Appellate Body is staffed by semi-permanent members each serving for four years, with the possibility of one reappointment, a process that ensures Geneva-insider representation. Access to the dispute settlement system is limited to WTO member governments. NGOs have a limited ability to participate through *amici curiae* briefs, although panels often refuse to consider their contents. Panels may ask for expert opinions on scientific and technical matters on an ad hoc basis, and have broad discretion on whether they follow the advice they get, or whether to mention this advice (Stewart and Karpel 2000). In one assessment (Ragosta 2000: 9) there is a 'lack of serious democratic controls on the DSB' because the views of ad hoc panelists and Appellate Body members becomes international 'law' without effective means for legislative intervention while, in addition, open hearings, open decisions, rights of affected parties to be heard,

and many other democratic procedures, are absent. And while many people called for opening WTO operations to public scrutiny after the Seattle demonstrations, little has subsequently changed, although at the WTO ministerial meeting in Doha, in 2001, a proposal was accepted to evaluate the dispute settlement process by May 2003 (Finer 2002). Finally, the panel reports on disputed cases are lengthy legal dossiers of several hundreds of pages with long summations of each party's arguments, third-party arguments and expert opinions. Sometimes thousands of pages of records are involved – 20,000–40,000 pages for instance. The panel findings are similarly lengthy – 100 pages single-spaced in the Shrimp–Turtle case. They are phrased in language accessible only to lawyers, making public discussion difficult. And this anti-democratic, legalistic, 'expert'-dominated system, the WTO suggests, is ideal for enforcing international environmental agreements!

Trade and labor

The relationship between free trade and labor rights has long been a contentious issue in the GATT/WTO system. Currently, labor standards are not subject to WTO rules and disciplines. Instead the WTO refers labor standards issues to the International Labour Organization (ILO), formed in 1919, and now a UN agency, where labor rights have been discussed since 1930. Most members of the ILO are also members of the WTO.

As members of the ILO many, but not all, countries approve of the setting of minimal standards for employment and work. Even when countries have ratified such standards, however, implementation and enforcement by the ILO have proved problematic. To revive interest in ratifying and applying a set of conventions, the ILO adopted a Declaration on Fundamental Principles and Rights at Work at its 86th Session in Geneva, June 1998. The declaration argued that, while essential, economic growth was not sufficient to ensure equity, social progress and the eradication of poverty. Instead, the ILO said, guaranteeing fundamental principles and rights would enable people to claim freely 'on the basis of equality of opportunity' their fair share of the wealth they had helped to generate. The fundamental rights subject to ILO conventions were listed as follows:

- freedom of association and effective recognition of the right to collective bargaining;

- the elimination of all forms of forced or compulsory labor;
- the effective abolition of child labor;
- the elimination of discrimination in respect of employment and occupation.

The ILO said it would assist member governments in fulfilling these objectives by making use of its constitutional, operational and budgetary resources, including the mobilization of external resources and support, as well as encouraging other international organizations with which the ILO had established relations to support the effort. The ILO stressed, however, that labor standards should not be used for protectionist trade purposes, and that the comparative advantage of any country should in no way be called into question by the universal declaration of rights (ILO 1998).

In the GATT/WTO, similar issues of labor standards were debated at Ministerial Conferences held at the beginning of the Uruguay Round in Punta del Este in 1986 and at the end of the Marrakesh Round in 1994, at Singapore in 1996, and at Seattle in 1999, the latter two held under the auspices of the WTO. Advocates for linking trade with labor rights in the WTO argue that two of the original GATT articles justify trade restrictions based on violations of fundamental labor rights: Article XX on general exceptions is cited as allowing member governments to restrict trade to protect 'public morals' and 'human life and health' – amending Article XX to include core labor standards would provide more specific exceptions; Article XXIII on dumping is cited when contending that suppressed worker rights in export industries constitute 'social dumping.' The USA, a main supporter of labor rights in the WTO (when Democratic administrations are in power), has not explicitly proposed such interpretations or amendments of Articles XX or XXIII. Since 1987, the USA has instead merely proposed establishing a working party to examine how internationally recognized labor standards relate to international trade and to the objectives of the GATT and the WTO. In this discussion, the USA has gradually come to focus on the ILO core labor standards as key benchmarks for workers' rights.

According to the WTO, member governments are deeply divided on the labor standards issue. On the one hand, some governments in Europe and North America believe that public confidence in the WTO and the global trading system would be strengthened by addressing labor standards. Many organizations, especially among the trade

union movement, want the WTO to take on the labor issue. The Congress of South African Trade Unions (COSATU), among others, has been a strong advocate of this position. Besides trade unions, many non-governmental organizations (NGOs), especially those advancing the cause of human and workers' rights, also advocate this position. Several member governments have suggested that the formation of a working group to study the issue would provide incentives for WTO member governments to improve conditions for workers. On the other hand, member governments, mainly from underdeveloped countries, believe that core labor standards do not belong in the WTO. Governments in these latter countries see labor standards as a disguise for protectionist policies on the part of developed countries. In this view, attempts to bring labor standards into the WTO are a smokescreen for undermining the comparative advantage of lower-wage developing countries. Instead, developing countries argue that better working conditions and improved labor rights come through economic growth. Were core labor standards to be enforceable under WTO rules, they say, sanctions imposed against countries with lower labor standards would merely perpetuate poverty and delay improvements in workplace standards. When the issue was discussed at the 1994 Ministerial Conference of the GATT in Marrakesh the chair of the meeting concluded there was no consensus among member governments on labor standards, and thus no basis for an agreement. At the WTO Ministerial Conference in Singapore in 1996 members of the WTO made the following Ministerial Declaration:

> We renew our commitment to the observance of internationally recognized core labor standards. The International Labor Organization (ILO) is the competent body to set and deal with these standards, and we affirm our support for its work in promoting them. We believe that economic growth and development fostered by increased trade and further trade liberalization contribute to the promotion of these standards. We reject the use of labor standards for protectionist purposes, and agree that the comparative advantage of countries, particularly low-wage developing countries, must in no way be put into question. In this regard, we note that the WTO and ILO Secretariats will continue their existing collaboration. (WTO 1996)

In a closing statement, Singapore Trade Minister Yeo Cheow Tong interpreted the paragraph to mean that 'there is no authorization in

the text for any new work on this issue … Some delegations had expressed the concern that this text may lead the WTO to acquire a competence to undertake further work in the relationship between trade and core labor standards. I want to assure these delegations that this text will not permit such a development.' By comparison, the trade minister of France, Yves Galland, said: 'the major debate of labor standards is here to stay in the WTO. It will never go away.' The acting US trade representative at the time, Charlene Barshefsky, said that Yeo's closing statement represented his own opinion, and that the binding statement on this issue was the ILO's Declaration of Fundamental Rights (Khor 1997).

The US Democratic administration, however, subsequently came under increasing pressure from organized labor, a main base of political support, to make a stronger argument for adding discussion of labor standards to the WTO agenda. At the 1999 Seattle ministerial meetings, the Clinton administration finally proposed that the WTO set up a working party to consider: the relationship between trade, core labor standards, and social protection; positive trade incentives; trade and forced labor; and trade-induced deterioration of national labor standards, with emphasis on export processing zones. In this, the USA was supported by Belgium, France and Norway. After President Clinton told the *Seattle Post-Intelligencer* that the WTO should, at some future point, use sanctions to enforce core labor rights, however, negotiations proved even more difficult than had been expected. As reported by the *New York Times*, the Egyptian trade minister, Youssef Boutros-Ghali, said the Clinton proposal on trade sanctions 'derailed any hope of a compromise agreement' while the trade minister from Pakistan said: 'We will block consensus on every issue if the United States proposal goes ahead … We will explode the meeting' (Greenhouse and Kahn 1999). India, Brazil and Egypt, speaking for the governments of developing countries, opposed creating a working group to discuss labor rights. They argued that the WTO was a commercial contract between governments based on rules and disciplines governing commercial activity and free trade; it was not based on judgments about other aspects of member states' domestic policies, including worker rights and other non-trade issues. To introduce judgments about member countries' domestic policy choices would fundamentally change the legal nature of the GATT/WTO agreements, they said. Developing countries see their low labor costs as essential to export competitiveness. Many trade ministers

from developing countries said that WTO sanctions over labor rights could be disguised protectionist measures that would be used to ban imports from developing countries. The Egyptian trade minister asked: 'Why all of a sudden, when Third World labor has proved to be competitive, do industrial countries start feeling concerned about our workers?' The trade minister of Kenya, Nicholas Biwott, added: 'The best forum to deal with such matters is the International Labor Organization.' By comparison, the American labor movement pushed the Clinton administration to make the WTO impose trade sanctions on nations that violated basic workers' rights, as with the right to form trade unions. They complained that the ILO was a toothless, underfinanced agency, unable even to prevent child labor, or protect the most basic labor rights. Thousands of protesters outside the meetings at Seattle were also insisting that the WTO adopt rules on labor, human rights and the environment. In response to pressures from both sides, and with an election coming up the next year, the Clinton administration transferred its allegiance to a compromise European Union proposal to set up a Standing Working Forum on Trade, Globalization and Labor Issues in which the WTO, the ILO, the IMF and other multilateral groups would examine how globalized trade affects workers (Grace 2000).

When the WTO reviewed Guatemala's trade policies in 2002 the Brussels-based International Textile, Garment and Leather Workers' Federation (ITGLWF), with 225 affiliated organizations in 110 countries, and a combined membership of 10 million workers, drew attention to Korean-owned garment plants, Choishin and Cima-textiles, producing for export to the USA. In 2001, workers at the two plants tried to organize workplace unions under a union federation called FESTRAS. Retaliatory actions by management included inciting non-union workers to commit violence, to the point where the lives of union supporters were at risk if they went to work; bribing workers to resign from the union, or securing letters of resignation from union members under duress; and threatening leaders with blacklisting. The ITGLWF general secretary, Neil Kearney, said that such gross violations of the right to organize demonstrated a clear need for a social dimension to trade and required holding the government of Guatemala to account. The argument was that the WTO's trade review mechanism was intended to encourage governments to fulfill their commitments, including the commitment to observe internationally recognized core labor standards made at the Singapore ministerial

meeting and reaffirmed at the WTO ministerial meeting in Qatar. The WTO was urged to use this review as a way of pressuring the government of Guatemala to honor that commitment. Guatemala's maquila sector is notorious for its anti-union behavior, to the extent that there are currently no collective agreements between employers and any of the 80,000 workers (ITGLWF 2002).

The concluding remarks by the chairperson of the Guatemala trade review committee made no reference to this request from a 10-million-strong international workers' federation, but instead said:

> In conclusion, through this Review we have gained a first-hand appreciation of Guatemala's achievements since the signing of the Peace Accords, and the challenges that lie ahead. It is my sense that Members very much appreciated Guatemala's efforts to improve its economic and social conditions, and encouraged it to continue down this road in order to further its prospects for sustainable economic growth and social development. Economic growth has come hand-in-hand with trade liberalization and other modernization efforts, and Members invited Guatemala to count on the help of the international community to both secure lasting institutional stability and enhance its participation in the global economy. (WTO 2002)

Note especially in this 'summary' the appreciation expressed by the WTO for an improvement in 'economic and social conditions' and the invitation to Guatemala to 'count on the international community' in securing 'institutional stability'!

The result of all this is that the WTO has no worker-oriented policies, despite a vague commitment to 'observe' core labor standards, or even a mechanism for discussing workers' rights and employment standards, or any interest in doing anything to help desperate people in export-oriented plants. While consistently linked to incomes, consumption and lifestyles in WTO rhetoric, trade is isolated from employment and work conditions. This is consistent with a neoliberal perspective that pays respect to people as consumers, yet denies their rights as workers. Notice also that the advanced capitalist countries, where workers have earned some rights through unionization, advocate a more socialized form of neoliberalism, but only in the safe form of trying to get member governments of the WTO to make vague commitments to standards that the ILO has not been able to enforce. Governments representing export-oriented regimes in developing countries resist even this pretense, arguing that their

main comparative advantage, low-cost labor, might be jeopardized. Yet economic activity founded on low-cost labor brings only desperate and precarious social forms of economic growth. We conclude that the WTO trading system, as presently constituted, fosters an antagonistic attitude toward development, in the sense of social benefits to people as workers, as distinguished from economic growth, in the particular form of benefits to people as consumers of low-cost goods. The WTO is anti-labor.

By comparison, business exercises considerable influence at WTO meetings. Confidential documents leaked to Greg Palast, whom we mentioned earlier, provide the minutes of private meetings between the Liberalization of Trade in Services (LOTIS) committee, the UK government's chief services trade negotiators, and the Bank of England, just before the Doha meeting of the WTO. Those attending the closed LOTIS meeting included Peter Sutherland, international chairman of the US investment bank Goldman Sachs and formerly the director-general of the WTO. LOTIS is chaired by the Right Honourable Lord Brittan of Spennithorne, QC, former head of the European Union, and currently vice-chairman of the international banking house UBS Warburg Dillon Read. Other LOTIS members include the European chiefs of Morgan Stanley Dean Witter, Prudential Corporation and PriceWaterhouseCoopers, all heavily involved in investment banking. LOTIS is an outgrowth of the 'British Invisibles,' more formally known as the Financial Services International London group. They were joined at various times by specially invited members of the European Commission's trade negotiating team. The minutes of the meetings indicate that government officials shared confidential negotiating documents with the corporate leaders, as well as inside information on the negotiating positions of the European community, the USA and developing nations. At a meeting held on 22 February 2001, Britain's chief negotiator on the GATS made reference to a European Commission paper on industry regulation that had been privately circulated to LOTIS members for their comment. As mentioned previously, the GATS agreement would affect all public services, from healthcare and education to energy, water and transportation, and would challenge national environmental, labor and consumer laws as 'barriers to trade.' Two sets of documents suggest that LOTIS and other corporate lobbyists have been successful in getting Western governments to adopt their plans to expand the reach of the GATS treaty radically. A confidential memo from inside

the WTO's Secretariat, written four weeks after the LOTIS meeting, indicates that European negotiators had accepted industry-favored amendments to GATS Article VI.4, known as the 'Necessity Test,' requiring nation-states to prove that regulations – from pollution control to child labor laws – are not hidden impediments to trade. Two of the LOTIS meetings dealt with hiring consulting firms and academics to provide government agencies with answers to criticisms by the World Development Movement (WDM), an NGO that questions GATS and the wider globalization agenda. The minutes noted that 'the pro-GATS case was vulnerable when the NGOs asked for proof of where the economic benefits of liberalization lay.' By comparison, an executive of Reuters, a global information company, offered to use his news service for spreading the LOTIS view. The executive told the LOTIS group that he 'wondered how business views could best be communicated to the public' and that Reuters 'would be most willing to give them publicity.' When the minutes of the meeting were released (leaked), the WDM said: 'For a long time conspiracy theorists thought there had been secret meetings between governments and corporations,' but that 'looking at these minutes, it was worse than we thought. [The WTO GATS proposals] are a stitch-up between corporate lobbyists and government' (Palast 2001b).

TRIPs

Our final critique deals with the TRIPs agreement emerging from the Uruguay Round. TRIPs applies basic GATT principles and existing international agreements to intellectual property rights with the WTO as adjudicator. The agreement has raised concerns about the centralization of control over multiple forms of 'intellectual property' (knowledge and its products) in multinational corporate hands. The pharmaceutical industry was a major player in the agreement. This is a highly concentrated industry in which ten companies control 50 percent of global sales mainly in developed countries (25 percent of the world's people consume 90 percent of the drugs). The main benefits of TRIPs have gone to the international pharmaceutical industry, which aggressively protects a highly profitable business with the intensive use of political power – trade sanctions, withdrawal of aid, and so on.

The most controversial issue involves drugs for people suffering from AIDS. Some of the main national actors include India, where the pharmaceutical industry was regulated by the fiercely nationalistic

India Patents Act of 1970. This act fostered the phenomenal growth of the pharmaceutical industry that came to be regarded by UNCTAD as a model for developing countries. In the mid-1990s prices for four typical drugs were ten times more expensive in Pakistan, seventeen times more expensive in Britain and thirty-seven times more expensive in the USA than in India. A year's worth of AZT therapy could be bought in India for $500, compared with $10,000–15,000 elsewhere. In Brazil, the state produces most of the AZT drugs and provides them free, cutting the AIDS infection rate in half (Rosenberg 2001); and in South Africa, where 20 percent of the people are HIV-positive, the minister of health was given permission in 1998 to import Indian drugs and cheap pirate copies. Thirty-nine drug companies brought suit against the South African government to prevent this, but the suit had to be withdrawn under public outcry in 2001, with the drug companies forced to reduce prices on limited quantities of drugs provided to Third World countries. The USA, however, continued to pressure Brazil to stop unlicensed production.

While mandating that WTO members have to allow patenting for medicines, the TRIPs agreement contains some flexibilities. For example, if patented drugs cost too much, government authorities can take measures such as issuing a compulsory license to an agency or company to manufacture or import a generic version of that patented drug, which can then be made more available to patients more cheaply. At the WTO's Ministerial Conference in 2001, the Doha Declaration on the TRIPs Agreement and Public Health was adopted as a response to protests. The resolution recognized the right of member governments to grant compulsory licenses to local drug producers to make drugs needed in emergency situations such as AIDS, malaria and other epidemics. The Declaration said: 'We agree that the TRIPs Agreement does not and should not prevent Members from taking measures to protect public health … We affirm that the Agreement can and should be interpreted in a manner supportive of WTO Members' right to protect public health and in particular, to promote access to medicines for all.' Several flexibilities were established that WTO members can use, such as the right to grant compulsory licenses and the freedom to determine the grounds for these. But countries have to establish appropriate provisions in their national patent legislation by using 'to the full' the flexibilities in the TRIPs agreement. They also have to formulate and implement national policies aimed at providing access to medicines for all. If such laws and policies are not

introduced, the provisions in the Doha Declaration do not translate into actual benefits for patients (Khor 2007).

The issue is, however, complex, and controversy continues. In 2007, in a landmark decision, the High Court in Chennai upheld India's Patents Act in the face of a challenge by Swiss pharmaceutical company Novartis, the world's third-largest pharmaceutical corporation, which hoped to secure patent rights for its Gleevec cancer med. Novartis claimed that India's patent law was not in line with the country's WTO obligations. Half a million people signed a petition, distributed by Doctors without Borders, calling on Novartis to drop this case. India is the primary supplier of cheap generic drugs to the rest of the world. Confusion remains about the WTO rules on drug patents. Under the WTO, only the fifty least developed countries can eliminate patents on pharmaceutical products until 2016. Other countries, including India, Brazil and Thailand, must grant and enforce patents. Any country can, however, issue a compulsory license on a patent and allow third parties, including generic drug companies, to use the patent in return for the payment of a royalty to the patent owner. Brazil and Thailand issued patents, but also granted compulsory licenses in return for royalty payments. The Indian Novartis dispute concerns the amount of discretion WTO members have in deciding what constitutes a patentable invention.

To give another example of this ongoing struggle over low-cost pharmaceutical drugs, in 2007 Thailand was warned by Peter Mandelson, Trade Commissioner of the EU, for trying to decrease prices of drugs for poor patients. Thailand uses compulsory licenses, allowing it to import cheaper generic versions of branded medicines produced by Western companies. The specific case involved Sanofi-Aventis, Franco-German maker of Plavix, a drug for heart disease that has been supplanted by cheaper Indian imports. Thailand was the first middle-income country to break the patent on a medicine to treat a non-infectious disease and to threaten compulsory licenses for an array of other drugs. The Thai government thinks that drug companies doing business in Thailand should offer drugs for no more than 5 percent above the generic cost. The cheap drugs were available through its public health system, covering 48 million poor Thais. And the Thai Ministry of Public Health conducted discussions with pharmaceutical companies for two years, before it made its decision. The EU and the USA protested this formally in February 2007 when the Thai government suspended the patents of three drugs

treating HIV/AIDS and heart conditions. The USA also threatened retaliatory action, placing Thailand on a watch list for intellectual property infringement. Mandelson said this approach is a matter of concern for the EU. It would be detrimental to the patent system, and to innovation and the development of new medicines. Mandelson said it would infringe WTO regulations that allow countries to waive intellectual property rules only to fight emergency health epidemics once all other avenues have been explored (Bounds 2007).

Saga of Doha

The Seattle ministerial meeting in 1999 launched the WTO's Millennium Round. But, untrue to its name, the round disappeared soon after the millennium dawned. And, for a while, it looked as though the Seattle protests had made it impossible for the WTO ministers to meet again. The WTO General Council, meeting in Geneva, tried to re-establish regular meetings and discussions. And, after fifteen years of negotiations, disputes and stand-offs, China was finally given formal approval to join the WTO – China's entry is particularly important given the low cost of its manufactured goods and the threat its exports pose to manufacturing systems all over the world under free-trade conditions. Robert Zoellick, G. W. Bush's appointment as US Trade Representative, tried to launch a new 'market access' round of WTO negotiations, but was unsuccessful. At the European Community, Pascal Lamy, European Community Trade Commissioner, called for the WTO to proceed without ending the EU's huge agricultural subsidies, again without result. Then came the September 11, 2001 attacks on the World Trade Center in New York and the Pentagon in Washington, DC. From the ashes of the World Trade Center came a new argument for a global economy centered on world trade. A new round of WTO negotiations was seen by First World politicians as a way of addressing the economic turmoil exacerbated by the September 11 attacks. Some politicians and business leaders equated liberalism (openness, trade) with freedom and prosperity, as opposed to terrorism (closed, isolated). Robert Zoellick deftly combined neoconservative geopolitics with neoliberal economics in a call for WTO action:

> Why is this WTO meeting important for America and the world right now?
>
> The events of September 11 have set the stage for our work,

> just as officials meeting in Geneva 54 years ago needed to consider the imperatives of their time. America and the world have been attacked by a network of terrorists who are masters of destruction, but failures at construction. They stand for intolerance and abhor openness. They fear foreign ideas, religions, and cultures. They see the modern world as a threat, not an opportunity. They leave people in poverty and half of humankind, women, in subjugation. Their strategy is to terrorize and paralyze, not to debate and create. The international market economy – of which trade and the WTO are vital parts – offers an antidote to this violent rejectionism. Trade is about more than economic efficiency; it reflects a system of values: openness, peaceful exchange, opportunity, inclusiveness and integration, mutual gains through interchange, freedom of choice, appreciation of differences, governance through agreed rules, and a hope for betterment for all peoples and lands. Therefore, just as the Cold War reflected a contest of values, so will this campaign against terrorism. Just as our Cold War strategy recognized the interconnection of security and economics, so must America's strategy against terrorism. By promoting the WTO's agenda, especially a new negotiation to liberalize global trade, these 142 nations can counter the revulsive destructionism of terrorism. (Zoellick 2001b: 4)

Third World countries came under pressure to accept a new round of trade negotiations, even though they had, for years, been concerned with exactly the *un*democratic nature of decision-making at the WTO. As reported by the *Guardian*, developing countries complained that they were being pressured by the threat that failure would destroy the WTO and damage the world economy. 'We are made to feel that we are holding up the rescue of the global economy if we don't agree to a new round here,' said Richard Bernal, a Jamaican delegate. Some delegates were told by lobbyists that the EU and the USA were threatening the most recalcitrant developing countries with losing access to Western markets under established trade deals if they continued to oppose new talks (Denny 2001). Zoellick and Lamy then forced through the fourth ministerial meeting held from 9 to 14 November 2001. The meeting was held in Doha, capital of Qatar, whose repressive laws on protest made it the ideal post-Seattle convention site. The November 2001 Doha Declaration of the Fourth Ministerial Conference of the WTO said that trade could play a major role in the promotion of economic development and the alleviation of poverty. It

said that all people should benefit from the 'increased opportunities and welfare gains that the multilateral trading system generates.' In a version of the 'failed states' argument (in which disorganized, poverty-stricken regions are safe-haven breeding grounds for terrorists) it recognized the 'particular vulnerability of the least-developed countries and the special structural difficulties they face in the global economy.' It said that the WTO was committed to addressing the marginalization of least developed countries in international trade and to improving their effective participation in the multilateral trading system. The Doha Declaration sought to place their needs and interests at the heart of the WTO's work program through two routes: (1) improving market access to Northern markets for developing countries by reducing import tariffs that prevent increased prices and distort competitiveness; (2) phasing out domestic and export subsidies that enable the overproduction of goods at low prices, often leading to the dumping of these goods at prices that are cheaper than those of locally produced goods. The most strategic area identified for 'reform' at Doha was agriculture, followed by non-agricultural market access (NAMA), trade in services (GATS), developing-country issues (Special and Differential Treatment), and aid for trade. The round was optimistically set to be concluded by December 2006 (WTO 2001c).

The main issue was the WTO Agreement on Agriculture (see our outline of the agreement earlier), with negotiating proposals submitted on behalf of 121 member countries. The long-term objective of the agreement was establishing a 'fair and market-oriented trading system through a program of fundamental reform encompassing strengthened rules and specific commitments on support and protection in order to correct and prevent restrictions and distortions in world agricultural markets' (ibid.). This meant improvements in market access; phasing out export subsidies; reducing trade-distorting domestic support (subsidies to farmers); all within considerations of special and differential treatment for developing countries.

The story behind this runs as follows. In the First World, subsidies are given by governments to farmers supposedly to protect traditional values by preserving vibrant rural cultures. Beginning in the 1930s most industrialized countries developed agricultural price-support policies to reduce the volatility of prices for farm products and to stabilize farm incomes. In food-exporting countries, such as the USA and France, agricultural subsidies are designed primarily to increase

farm income, either by raising the long-term level of prices above free-market levels, or by providing direct payments to farmers. In the USA agricultural subsidization dates back to the Agricultural Adjustment Act of 1933, which paid farmers not to plant, or to destroy, crops and animals in order to reduce supply, raise prices and increase farmer incomes. By 2000 aid to farmers (including so-called emergency payments) was $22 billion, three times the 1996 level. In 2007, the US Congress passed the Farm Bill Extension Act, a $290 billion, five-year agricultural policy bill that continues a long history of agricultural subsidy as well as pursuing other areas, such as energy, conservation, nutrition, and rural development. Congress overrode a presidential veto on a vote of 316 to 108, indicating wide political support in the USA for farm subsidies and making it improbable that the USA would comply with any WTO-mandated reduction of farm subsidies. The EU similarly gives subsidies of $50 billion a year to farmers under the Common Agricultural Policy. Half the EU support goes, however, to 1 percent of producers – including the richest man in the United Kingdom, the Duke of Westminster, who owns about 55,000 hectares of farm estates, and received a subsidy of $480,000 as direct payments in 2003/04, and in addition gets $550,000 a year for the 1,200 dairy cows he keeps. In the USA 70 percent of farm subsidies go to 10 percent of the producers, mainly agribusinesses – recipients of federal agricultural support included media billionaire Ted Turner and David Rockefeller, whose family is, well, not exactly short of money. On the other side, Third World countries argue that under WTO rules they are forced, by threat of sanctions, to stop supporting their farmers, and to open their food markets to foreign competition, while the USA and the EU are allowed to massively subsidize their farm corporations. The effect of these subsidies has been to flood global markets with below-cost commodities, depressing prices and undercutting producers in poor countries. Once introduced, subsidies have proved extremely difficult to end. Agricultural subsidies in the USA, the EU and Japan were issues of contentious debate in the Uruguay (1986–94) Round of international trade negotiations under the GATT, and remained so in the Doha Round.

At the WTO, a group of middle-income agricultural exporting countries, the G20 (Group of 20, also variously known as the G21, G22 and G20+), which includes Argentina, Brazil, China, India, Indonesia, Mexico and South Africa, pressed for an end to agricultural subsidies in industrialized nations. Specifically, they called for the

elimination of export subsidies on products of interest to developing countries, the reduction of tariffs, and designation of 'Special Products' by developing countries (i.e. allowing protection for products important to a developing country's food security), reduction of 'Blue Box' supports (i.e. trade- and production-distorting supports), capping of 'Green Box' supports (those with minimal distorting effects) and reducing US subsidies to cotton farmers (Tussie 2004). Theoretically, the USA has said that it wants to remove all trade barriers. But it is subject to political pressure from farmers' groups (especially the American Farm Bureau Federation) influential in states that are key to the Republican vote. The USA wants merely to *limit* its farm subsidies in some way – and indeed, given the reluctance of Congress to countenance any intrusion into farm subsidization, that is the most that the Trade Representative can offer. The EU has said it would cut average farm tariffs by a half, eliminate export subsidies by 2013, and cut trade-distorting domestic farm subsidies (Blue Box) by 70 percent. First World countries demand that these offers to reduce farm subsidies (fragile though they might be) have to be matched by commitments from developing countries to lower their barriers on services and non-agricultural goods (NAMA). Rich countries also want to limit the scope of Special and Differential Treatment (SDT) measures that soften the impact of tariff reductions for developing countries. Also, they want to decrease or eliminate non-reciprocal Preferential Trade Agreements (PTAs), which allow least developed countries to benefit from lowered tariffs on certain products, to boost their access to international markets without the requirement of lowering their own tariffs in return. The EU wants to replace its non-reciprocal PTAs with African, Caribbean and Pacific (ACP) countries with Economic Partnership Agreements (reciprocal free-trade agreements negotiated on a bilateral basis) that would require the elimination of ACP tariffs.

The other main issues discussed in the Doha Round include making the TRIPs agreement more flexible for poor countries through a declaration by ministers that 'nothing in the TRIPs agreement shall prevent governments from taking measures to protect public health.' As well, negotiations on Non-Agriculture Market Access (NAMA) call for a reduction in or elimination of tariff peaks, tariff escalation, high tariffs and non-tariff barriers, particularly on non-agricultural goods that are of export value to developing countries.

The WTO Ministerial Conference of 2003 was held at Cancún,

Mexico, amid massive protests. South Korean Farmers and Fisheries president Lee Kyung Hai committed suicide on the first day of the conference in protest against the price-distorting agricultural subsidies of the EU and the USA. The North–South divide was most prominent on issues of agriculture. Rich countries' farm subsidies (both the EU's Common Agricultural Policy and the US government's agro-subsidies) became a major source of contention. At the conference it became clear that Third World countries were beginning to assert themselves, stick up for their interests, and resist intense US and EU pressures. The G90, otherwise known as the Group of 90, an alliance among the poorest and smallest developing countries in the WTO, emerged as a strong grouping at Cancún. The Cancún ministerial convened to forge concrete agreement on the Doha Round objectives collapsed after four days. Member countries could not agree on issues of farm subsidies and access to markets.

In August 2004 a General Council meeting in Geneva culminated in a 'framework' to restart talks, the so-called 'Geneva Decision' in which the USA, the EU, Japan and Brazil agreed to end export subsidies (although neither the USA nor the EU is mandated to remove its export subsidies until the other does so), reduce agricultural subsidies by 20 percent (although with a 'cap' on product-specific subsidies at their 'respective average levels') and lower tariff barriers, while developing nations agreed to reduce tariffs on industrial goods, with the right to specially protect key industries. The framework also provided for simplified customs, and stricter rules for rural development aid. Note that this was a General Council meeting, not a ministerial.

The Sixth WTO Ministerial Conference took place in Hong Kong, 13–18 December 2005. This meeting was supposed to culminate the Doha Round. And on the last day, the WTO member countries, some pressured by First World economic and political interests, managed to present a common Ministerial Declaration. Poor countries conceded to rich countries' interests in freeing trade in NAMA goods and services in exchange for some concessions on export subsidies for agricultural goods. The EU promised to eliminate export subsidies by 2013 – although this form of subsidy accounts for only 3.5 percent of the EU's overall agricultural support. Thousands of protesters demonstrated outside the Hong Kong Convention and Exhibition Center, the location of the talks. Clashes with the police left 116 people injured, including 56 police officers.

The July 2006 talks in Geneva failed to reach an agreement about

reducing farming subsidies and lowering import taxes. Director-General Pascal Lamy said there were no significant changes in the negotiators' positions and the gaps remained too wide. Faced with this, Lamy recommended suspension of the Doha negotiations to 'enable the serious reflection clearly necessary on the part of participants.' The US Trade Promotion Authority Act of 2002, giving the president 'fast-track' authority to negotiate trade deals with other countries, while granting Congress the right only to agree or disagree, but not to amend, expired in 2007. This authority had made promotion of trade deals easier for the US administration.

In a sign of the times, in June 2007 four regions considered to be key members of the WTO – the USA, the EU, Brazil and India, or 'G4' – met to break the deadlock blocking global trade negotiations. A major impasse opened between them. The main disagreement was over market access and cutting rich-nation farm subsidies. Brazil's foreign minister, Celso Amorim, described the negotiations as an unequal 'rate of exchange' in that the two First World countries did not want significant changes in their agricultural subsidies, while still insisting on large industrial tariff cuts in developing countries. The talks were suspended. Following this, the new US Trade Representative (after Zoellick was made president of the World Bank), Susan Schwab, began saying that a small group of developing countries was threatening to block progress in the Doha negotiations, while, in contrast, the USA was eager to reach a deal. As Schwab put it:

> slippage occurs when negotiations are reframed to placate the outliers, the naysayers, and the obstructionists. Efforts to achieve consensus in the WTO are critical, but not if they generate a lowest-common-denominator outcome that fails to generate economic growth. Second, it is crucial that developing countries continue to be fully represented at the negotiating table. With that place at the table, however, comes a degree of responsibility and accountability that several advanced developing countries, who have become major players in the global economy, have not yet been willing to undertake … this is not a North–South fight. Forward-leaning developing countries that wish to make and benefit from market access contributions in an ambitious scale should be treated with the same respect as their less albeit louder counterparts. (Schwab 2008: 5–6)

The accusatory and aggressive tone of Schwab's speeches brought negative responses from Third World countries' diplomats at the

WTO. Groups of Third World countries met separately to consider their collective position in the WTO – for example, summit meetings of the India–Brazil–South Africa (IBSA) Dialogue Forum, and four developing country groupings, the ACP Group, the African Group, the NAMA-11 and the Small and Vulnerable Economies Group. And in a landmark decision, the WTO Appelate Body in 2008 ruled against US cotton subsidies in a case brought by Brazil. The WTO report supported Brazil's claim that the $3 billion in subsidies the USA pays cotton farmers distorts global prices and violates international trade rules. In its complaint, Brazil used data from the US Department of Agriculture to argue that the subsidies increased American cotton output, taking away potential export markets from Brazil, and undermining the livelihoods of its farmers. Brazil also claimed that the USA was providing illegal export subsidies to American agribusiness, which was given $1.7 billion to buy American cotton from 1999 to 2001, the period covered in the WTO case. The combined aid has helped make the USA the world's biggest cotton exporter, with more than 40 percent of the world market (FarmPolicy.com 2008).

Finally, in July 2008, in meetings in Geneva, a last attempt was made at concluding the eight-year-old Doha Round. Trade ministers from thirty selected delegations convened in 'Green Room' negotiations – the list of countries invited was not made public, nor is there a formal record of discussions in these 'informal meetings,' leading the left-out countries to complain about 'lack of transparency.' The Indian commerce minister, Kamal Nath, objected to the double standard of developed countries wanting 'carve outs' (special treatment or exemptions) for themselves to continue to protect their rich farmers, while denying India and other developing countries the possibility of defending the livelihoods of their poor farmers. The Indian delegation insisted that there be protections for their farmers from the surge in imports that inevitably follows tariff cuts – in Ghana in 1998, for example, local rice production accounted for over 80 percent of domestic consumption, but by 2003, after liberalization, the figure was less than 20 percent. India wanted the right to protect farmers should a similar cataclysmic event begin to occur. Faced with rising food prices, a number of Third World countries, led by India and China, opposed opening up their agricultural markets, either by blocking imports of strategic products, such as rice or grains, or through rules that would allow them to rapidly increase 'safeguard' tariffs if faced with a sudden flood of imports. The USA and the EU

proposed a threshold before such support could be given that was too high to be meaningful. Backed by many other countries, India held its ground. The talks collapsed. The EU Trade Commissioner said that this 'buried' the Doha Round (Davis and Miller 2008). In the aftermath, the conventional wisdom became: 'the era in which free trade is organized around rules set in the West – with developing nations following along – definitely appears over, and few are mourning its demise. Even in America … advocates of the system are on the defensive' (Sanger 2008).

Opposition to the WTO

For years GATT operated virtually without opposition from social movements. But during the Uruguay Round of negotiations the realization developed among many ordinary people that more than just tariffs were being negotiated. Opposition by small farmers, labor unions and environmentalists began to build. And it was recognized that significant aspects of national sovereignty would be lost to an organization, the WTO, which no one had elected. A number of NGOs, representing citizens' groups, environmentalists, labor, anti-corporate and anti-globalization movements, showed increased interest in the effects of free trade. The GATT ministerial meeting in Brussels in 1990 was met by thousands of demonstrators. At the 1992 Rio Earth Summit NGOs tried to introduce alternative treaties that opposed GATT, while similar attempts were made to introduce alternative statements at the Marrakesh signing of the Uruguay Round agreements (Dunkley 2000: 101–2). Opposition to free trade became far more evident in the USA, Canada and Mexico during the extensive discussions leading to NAFTA, signed in 1992. The Zapatista rebellion, which began in January 1994, was timed to correspond with the implementation of NAFTA, which Subcomandante Marcos called 'a death certificate for the Indian peoples.' NAFTA and the GATT/WTO system came to be seen as linked expressions of a new economic model, corporate globalization, in publications by Ralph Nader, founder of Public Citizen, and Lori Wallach, director of Public Citizen's Global Trade Watch (Nader and Wallach 1996). The second Ministerial Conference of the WTO, held in Geneva in 1997, and planned as a birthday celebration to mark the fiftieth year of the free-trade system, was met by 10,000 protesters in a generally peaceful demonstration over the social dislocations caused by free trade. Gathered under the rubric of 'People's Global Action,' the

groups protesting at Geneva represented farmers who believed that with the removal of trade barriers multinational corporations would take over their markets and lands, workers protesting about job losses, and consumers concerned about harmful products such as tobacco and genetically engineered foods.

The lead-up to the Seattle ministerial in 1999 was marked by extensive preparations involving a network of environmental, labor and human rights organizations. Groups active in the Seattle protests against the WTO included the Abya Yala Fund, supporter of indigenous peoples; A SEED, an environmental and development organization; the AFL-CIO; the Alliance for Sustainable Jobs and the Environment; Amazon Watch; the Anarchist Action Collective and the Black Army Faction, two militant anarchist groups based in Eugene, Oregon; Christian Aid; CISPES, Committee in Solidarity with the People of El Salvador; Citizens Trade Campaign; Consumers International; Direct Action Network; Earth Justice Legal Defense Fund; 50 Years Is Enough; FOCUS on the Global South; French Peasants Confederation; Friends of the Earth; Global Exchange; Greenpeace; the Humane Society; Indigenous Environmental Network; Institute for Local Self-Reliance; IAMAW, a machinists' and aerospace workers' union; International Brotherhood of Teamsters; ICFTU, a confederation of free trade unions; International Forum on Globalization; NO2WTO, an anarchist group; the National Labor Committee; National Lawyers' Guild; Oxfam International; People's Decade for Human Rights Education; Peoples' Global Action; Project Underground, a human rights and environmental group; Public Citizen's Global Trade Watch; Rainforest Action Network; Ruckus Society (providing training in civil disobedience); Sheet Metal Workers' Union; Sierra Club; the Sierra Club's Responsible Trade Program; Southwest Network for Environmental and Economic Justice; Third World Network; UNITE, Union of Needle Traders, Industrial and Textile Employees; United Automobile Workers; United Farmworkers of America; United Steelworkers of America; and United Students against Sweatshops. In particular, the 'teamster–turtle alliance,' the banner phrase emerging from the Seattle protests, referred not so much to the Teamsters' Union specifically as to a newly constituted alliance between labor unions and environmental groups that characterized the protests. For example, the Alliance for Sustainable Jobs and the Environment is a coalition of Earth First!ers and Steelworkers, opposed not just to the WTO but to all manifestations of global capitalism that exploit

workers and the environment (Cockburn et al. 2000: 8–9). The Seattle protest movement was characterized also by extensive communication through the Internet and by the preparation of considerable quantities of accurate information on the WTO, particularly by Public Citizen's Global Trade Watch, Global Exchange, the International Forum on Globalization, *The Nation* and other research/political action groups, teach-ins, and a public debate held in the Seattle town hall featuring spokespersons for both sides of the argument on globalization and free trade. Indeed, the protesters probably knew more about the WTO than many of the delegates after reading *A Citizen's Guide to the World Trade Organization* published by Global Exchange (1999) or *Whose Trade Organization? Corporate Globalization and the Erosion of Democracy* put out by Global Trade Watch (1999).

The essential position of the anti-WTO demonstrators in Seattle can be gauged from a press statement, made in early November 1999, by Jerry Mander, president of the International Forum on Globalization, an educational and research institute composed of some sixty scholars, activists and economists from twenty countries. The following arguments were made:

1 The WTO has been ceded crucial new powers, including major enforcement powers, beyond those given to any other international organization, including the UN.
2 The WTO has presided over the greatest transfer in history of real economic and political power from nation-states to global corporations.
3 The WTO has come to rival the IMF as one of the most powerful, secretive, anti-democratic bodies and threatens to soon become the world's first bona fide, unelected global government.
4 Among the WTO's powers is the ability to challenge any member nation's constitutional rights to make laws and standards found to be obstacles to corporate free trade, as defined by the WTO, and as ruled upon by its own tribunals, whose deliberations are closed to the public.
5 These tribunals have consistently ruled against the environment and the interests of Southern, underdeveloped nations.
6 The obstacles to free trade that the WTO wants to remove are actually national, state and provincial laws made on behalf of the environment, small farmers, public health, consumers, food safety, local culture, small business, labor and hundreds of other

concerns and regulations that citizens of sovereign nationals may view as important, but that may be inconvenient for corporate free trade.

7 The goal of the WTO is to expand the freedoms of corporations to act beyond the reach of any national regulations and to diminish the rights of national governments to regulate commerce on behalf of human beings or nature. (Mander 1999)

While there were differences among the opposition groups, they shared the following demands:

1 No expansion of the WTO's power and authority into new areas such as investment, procurement, services or agriculture; no new biotechnology agreement; and no new Millennium Round of negotiations.
2 Public reassessment of the WTO's performance, and discussion of how it could be made more democratic, transparent, accountable and responsive to a completely different hierarchy of values, such as social equity, ecological sustainability, cultural and biological diversity, and national and regional economic and food security, above the welfare of corporations.
3 Should such a reform not be achieved, closing the WTO down, and devising a system that involves the non-corporate community as full participants in the process.

The Seattle demonstrations against the WTO marked the beginning of a new kind of radical activism different from the gender and identity concerns of the early 1990s (Cockburn et al. 2000: 3–4). Opposition to free trade produces a diverse politics composed of a network of interlocking concerns ranging from the environmental effects of trade and unregulated growth to the effects on displaced workers, to indigenous peoples and peasants, to the undemocratic nature of the WTO as an institution. This diversity lends unpredictability to the demonstrations as groups cohere and splinter. Alliances and commitments formed around the Seattle protests have continued – to the degree that, since Seattle, every major international economic meeting has attracted massive protest.

Types of critical response

Three types of critical response to the WTO have developed: contestation and reform (restrained globalization); globalization from

below (democratized globalization); and 'delinking' (localization instead of globalization).

Movements of *contestation and reform* try to recover the state's authority in regulating trade in the interests of delivering social benefits. Such movements are typically peace and human rights organizations, groups fighting structural adjustment, groups advocating land reform and some anti-corporate groups. These movements contest limitations on state authority and, thus, sovereignty in decision-making under the existing forms of neoliberal globalization. As part of this, they challenge the subordination of social priorities to 'international competitiveness.' These movements sponsor national legislation, mount judicial challenges, mobilize international agencies and actively engage in boycotting and protesting. Jubilee South and 50 Years Is Enough mobilize against the WTO because, as with IMF and World Bank structural adjustment, they see governments losing power to international agreements.

Globalization from below refers to movements based in a kind of people's internationalist populism that wants to replace the existing institutions of governance with radically democratic ones. The main groups articulating this approach are environmental movements, socialist movements, labor movements, anti-Free Trade Area movements, the Zapatistas in Mexico and other indigenous peoples' movements. The basic idea behind movements of this type is that alliances of people threatened by environmental degradation, human rights abuses and lax enforcement of labor standards can be formed that hold corporations and governments accountable to the people in what has been referred to as 'global civil society.' These movements oppose globalized neoliberalism with globalized resistance movements. The Zapatista movement in Chiapas, Mexico, characterizes globalization from below in two main ways: an insistence on self-determination rights for indigenous peoples and peasants, and at the same time a recognition of solidarity with all oppressed peoples. The Zapatistas held the 'First Intercontinental Encounter against Neo-Liberalism and for Humanity' in Chiapas in April 1996, attended by 3,000 international delegates from forty-three countries, followed by conferences in Berlin and Spain in 1997. The Zapatistas reject export-based economies, international lending agreements, free trade, privatization and other forms of economic liberalization, and want to redistribute land and abolish poor peoples' debt as the core of a different type of economic change. The Zapatistas address the

multiple oppressions of race, gender and sexual orientation, and insist that the only way to provide justice and dignity for indigenous peoples is to change the entire racialized system. They insist that power has to be 'collective and communal' and want to create non-electoral approaches to democratic change.

Delinking refers to the relocalization of livelihood ideals and a return to local sovereignty. This set of ideas proposes a radical restructuring of the globalized political economy with localities voluntarily cutting themselves off from global markets in labor, goods and capital. Although this is the least familiar form of resistance, a number of activist groups, including anarchists, movements in defense of small businesses, sustainable development movements, sovereignty movements and religious nationalist movements, embody its goals. Three distinct concerns inform their ideas: economies in dialog with their ecological bases; community economic health; and political autonomy, including the assertion of a people's right to govern their own lives. The most articulate version comes from anarchist thought, which has long advocated local economic autonomy and the disappearance of the state. With a prolific youth membership, anarchism is involved with animal rights, feminism, anti-racism, music, homelessness, free speech and concerns about police and prison abuse.

Does the WTO have to go?

After the Second World War trade reassumed the crucial position for the growth of economies it had held in the second half of the nineteenth century. Increasingly trade became the single most important part of the expansion of economies linked into a globalizing system. Global institutions governing the conditions of trading relations among countries were, at least potentially, placed in positions of great political-economic power. But the recognition by nation-states, particularly the USA, that the global governance of trade might exert significant control over national economies, and the apprehensions aroused by this in a system riven by international competition, long prevented this potential from being formalized in an institution. Instead international trade was intermittently regulated through rounds of bilateral and multinational negotiations and the set of agreements known as the GATT – 'intermittently' because agreements could be unilaterally abrogated, retaliatory actions could easily be initiated, especially by powerful countries, and there was little in the way of an enforcing mechanism. But the number of countries

involved in the GATT rounds grew, the proportion of world trade that came under its aegis increased, and a system of power relations stabilized under the domination of the USA, so that finally the GATT could be concretized as the WTO.

The basic power of the GATT and the WTO resides in GATT Article I, the general most favored nation treatment clause, saying that any advantage, privilege or immunity granted by any member country to another shall be immediately and unconditionally accorded to all other member countries. That is, lower tariffs granted to a favored nation are automatically extended to all members of GATT/WTO, but are not necessarily granted to non-members, unless negotiated separately through bilateral agreements. By joining GATT/WTO a country can gain far freer access to global markets for its exports, with the WTO deciding if access rights are granted and exercised. This places the WTO at the center of power in the regulation of the global economy, in a position different in emphasis from (in that trade is the focus), but at least equal in importance to, that occupied by the other IFIs. And given the extensions made to the power arena of the GATT during the Uruguay Round into services, intellectual property rights and the governance of certain capital movements, even as it came into being the WTO was also assuming a dominant position in the global economic governance structure.

The WTO is an institution formed through the interactions of governments under certain conditions. Governments meet at the WTO through their trade ministers, trade representatives and delegates under specific circumstances – to discuss trade issues; with declared immediate objectives in mind – to reduce trade barriers and settle trade-related problems; and with an overall purpose – to increase the volume of trade, increase production and raise incomes. Even more than an institution, the WTO is a place, or a restrictive discursive space, where intergovernmental meetings occur, experts congregate, expertise is employed, and decisions are made within a common understanding expressed in a specific, political-economic language. In other words, the WTO is an agent dominating a center of hegemonic power, as outlined in Chapter 1, part of a broader complex of institutions, mostly UN-connected, in Geneva, and ensconced within a broader geo-economic regime. In the dialog that occurs within this power-space, economies are viewed from entrenched positions, and discourse is contained within limits on what is taken seriously, as part of a 'constructive dialog,' and what is regarded as irrelevant, frivolous,

'not constructive' or, recently, 'obstructionist.' The approved dialog now centers on free trade, within an overall neoliberal conception of economic growth, justified through the universalistic belief that everyone benefits (mainly as consumers) from trade and growth.

This discursive hegemony rests on the assumption that 'free trade is good for everyone concerned' and this in turn is based in Ricardo's theory of comparative advantage – here we raise issues discussed previously in Chapter 1. Pascal Lamy, WTO director-general, said in 2006:

> There is a popular story among economists that when a critic asked Paul Samuelson, a Nobel-prize laureate, to provide a meaningful and non-trivial result from his discipline, Samuelson responded: 'comparative advantage.' The theory by David Ricardo, who uses the example of England producing cloth and Portugal producing wine, and both of them growing their output of these products through specialization, is the basis for the idea of the benefits of open trade.
>
> By producing goods and services in which it has a comparative advantage – and importing others – a country manages to create more value than it would otherwise do. In ideal conditions, trade allows countries to specialize in products that they produce best – and import others, and everyone stands to gain. As a consequence, the economies of all countries grow. (Lamy 2006)

But if we examine the England–Portugal trade exchange closely, we find that 'free trade' between cloth and wine did not benefit both countries equally, but benefited England exclusively (Sideri 1970). From the beginning of modern economics, comparative advantage and free trade moved understanding in a direction that has not only been biased, but in one main part at least (universal advantage) has been fundamentally wrong in the positivistic terms normatively accepted by the discipline of economics – truth as representational accuracy. Economists who have proclaimed on this basis that free trade is universally beneficial have been equally mistaken all along, and are wrong now. Trade policy based in this theory is equally without foundation – it is simply biased opinion. Free trade creates a global space within which benefits accumulate to a few people (industrialist capitalists, multinational corporations, finance capital) in a few dominant countries (Britain, the USA, Japan, and now China), and this does not benefit humanity but renders it into unequal parts, the rich and the poor. By comparison, the guardian of the resulting global

free-trade system, the WTO, says that it serves the interests of all equally in that free trade produces economic growth which produces higher incomes for everyone.

When everyone is equal, we suspect that some might be more equal than others. In thinking further about this, consider the items whose international movements are 'liberalized' under WTO agreements – commodities, services and the capital associated with their production. Who produces these? Corporations. And what movements are not covered? Workers wishing to move to areas where wages are higher or working conditions better. Consider too that issues of worker rights can hardly be raised, let alone discussed, within the WTO, and that the institution's record on the regulation of environmental relations belies its rhetoric on multilateral agreements. Consider as well that intellectual 'property' rights apply mostly to multinational corporations, not singers desperate for the revenues lost by pirated CDs. And remember the influence of the investment bankers on trade missions.

From these and the many other considerations arising from our detailed examination, we conclude that the WTO acts in the interests of multinational corporations in creating a global economic space freed from governmental regulations that might otherwise restrict the movement of capital. We find that governments interact within the WTO under conditions that limit discussion to an approved set of topics using the language of neoliberal optimism. Furthermore, the WTO itself, as an organization, is active in the formation, promotion and protection of the free-trade component of an overall neoliberal ideology. It promotes the extension of its own powers of regulation into vast new areas, such as intellectual property rights, which are governed in the most undemocratic of ways – within closed rooms, where an already committed expertise rationalizes foregone conclusions. Under the influence of the US Trade Representative, the WTO was a nasty, reactionary organization, employing personal attacks on those who disagreed with its positions and tactics. This led, over the last few years, to resistance from Third World countries within the organization, to the degree that each time the WTO tried to meet under the Doha Round, it disintegrated into dissensus. Meanwhile, as with the Brazil–US cotton case, the dominance of the USA is finally being seriously questioned. The power of Third World countries such as Brazil, China and India is rapidly increasing. The days when a few First World countries could dominate trade discussions are over, and

the WTO finds itself having to change radically, or be dismissed as a serious global governance institution.

The center of power around trade is a focal point of controversy. As a crucial dimension of contemporary economic life, trade is an activity that can be used for political and social change. This need not be 'reform' that benefits corporations. Trade is a discursive space that has to be opened to a broader, democratic process, where social movements represented by highly informed NGOs are active agents, and alternative conceptions such as fair trade, under which workers get a living wage and environments are actively protected, contend with equal force. Unless these kinds of fundamental changes are made, and regardless of the increasing independence of Third World countries, the WTO is a dangerous new form of global state … that has to go!

SIX

Global financial capitalism and the crisis of governance

The international financial institutions (IFIs) that form the focus of this book operate within the broader societal system of capitalism. In this final chapter, we want to stand back from our detailed discussions of the particular governance institutions to look at the changing nature of global capitalism. The IFIs, especially the IMF and the WTO, are undergoing their own internal crises – the IMF left with not much of a role to play, the WTO dissolving in struggles among groups of member states. But we have looked at these internal crises enough already. Now let us try to relate the internal crises of the global institutions to the partly external crises in the capitalist system.

The late twentieth century saw the emergence of a new kind of capitalism. A capitalism dominated by huge corporations producing commodities and services was replaced by a capitalism dominated by huge corporations controlling access to investment capital. In the new 'global finance capitalism' finance is the leading fraction of capital; dominant governments, like those of the USA and Britain, and global governance institutions, like the World Bank and the IMF, are integral parts of the financial apparatus, trying to rescue private finance and even merging with it, especially at times of crisis; financial capitalism normally operates on a global scale; and thus finance capitalism takes the total form of a political-economic-ethical-cultural and spatial system. The term 'finance capital' was coined originally by the Austrian Marxist Rudolf Hilferding (1981), meaning an increasing concentration and centralization of capital, in the institutional form of corporations, cartels, trusts and banks. More recently, David Harvey (2005) has argued that ownership (shareholders) and management (CEOs) have fused together, in capitalist enterprises, as upper management is paid more in stock options than in salaries. Increasing the price of the stock becomes the objective of operating the corporation. And productive corporations, diversifying into credit, insurance and real estate, have become increasingly financial in orientation. This is connected to a burst of activity in an increasingly unregulated,

and rapidly globalizing, financial sector in 'the financialization of everything,' meaning the control by finance of all other areas of the global economy.

Nation-states, individually (as with the USA) and collectively (as with the G7/8), together with the IMF and the World Bank, have to support these financial institutions, and the integrity of the financial order, for that is what keeps economies going (witness the massive intervention of the central banks in the financial crisis of 2007/08). The main difference between Hilferding's finance capital and today's global finance capitalism is a greater abstraction of capital from its original productive base, the faster speed at which money moves across wider spaces into more places, the level, intensity and frequency of crises that take financial rather than productive forms, and the spread of speculation and gambling into every sphere of life. We have also seen the 'democratization' of finance capital through inclusion into the reserve army of the financiers millions of people who benefit through home ownership, pension fund investments, mutual funds and education savings. No longer do we just have fat cats or sharp kids manipulating share prices, but millions of 'quasi-capitalists' worry all night about their bank savings deposits, their retirement savings, and their hopelessly inflated house prices. On the one side, finance capitalism has developed massive, sophisticated powers of social and cultural control over governments, classes and regional populations, so that critical, political response to widening inequalities and instabilities may be muted for long stretches of time – we live in a time of global co-optation. On the other hand, the level and depth of financial crisis have increased, the 'space of crisis' has widened to include virtually all national economies, and the 'space of victims' (direct and indirect) is now virtually universal – we live in a time of global catastrophe.

The intersection of these global tendencies creates an air of unreality, a distancing in which crises are dealt with superficially even as their intensity deepens. Crises that are structural and endemic appear to burst onto the political-economic stage as apparently spontaneous events. Every so often the global governance institutions are called on to intervene. The sheer size of the global financial system, however, where shifts in capital are in the order of trillions of dollars, overwhelms the monetary capabilities of the IMF or the World Bank, which are measured in billions of dollars. So in reality crises simply accumulate, for they are neither understood, nor can they be controlled, nor is there even much popular will to control them, because

many people combine the roles of perpetrator and victim, and the finance system is so big and amorphous that it seems impregnable.

As with the liberal, global system of the late nineteenth century, the neoliberal system of the late twentieth and early twenty-first centuries operates globally under the political domination of one hegemonic, 'democratic' nation-state. The change from Pax Britannica to Pax Americana maintains an essentially similar political structure, but the military might of the armed forces of the financial state has increased, while the time taken for interventions to occur has dramatically decreased with the development of new technologies of warfare. Similarly, the instantaneous transactions of finance capitalism involving trillions of dollars a day are beyond the capabilities of governments or governance institutions even to measure. This is the new financial environment in which the IMF, the World Bank and the WTO operate. In some ways their interventions into the global financial economy become increasingly necessary. In other ways such interventions become more futile. On the knife-edge between inevitability and futility, there you will find the IMF, the World Bank and the WTO, eternally optimistic about 'meeting new challenges' on their web pages, but unconfident in their minds, wondering whether they, or the system they were born to manage, will survive. They are the unholy trinity of a failed religion called neoliberalism. Faith in neoliberalism miraculously survives. Faith in the high priests, desperately making the magic sign of the cross, diminishes.

Social formations, policy regimes, IFIs

This new finance capitalism appeared on the global scene in a burst of cultural and economic exuberance that can only be admired (worshiped), as a sign of the new global times, by an awe-stricken public. At least, that is what appears in popular media that are leading parts of the very system on which they are supposed to report. But then, global finance capitalism might be rewritten as global media capitalism, because mediatization is almost as powerful culturally as financialization is economically, and both share that air of fantastic unreality that takes the place of what once was called 'everyday life.' So, the sports news gets more airtime and, alas, far more attention than news of the war. Don't get killed on a Saturday; no one will hear of your death. Yet, as Marx once almost said, analysis entails breaking the mesmerizing dazzle of the global spectacle by moving thought toward discovering structural essence.

Global finance capitalism emerges from understandable structural changes. To get at these structural changes we need to employ a couple of shorthand, theoretical terms – a few words that describe a myriad of things, so the mind does not think in lists. Thus far we have spoken of historical forms of a political-cultural-economic capitalist totality as 'social formations,' phases within an overall capitalist mode of production. There seem to have been three intra-capitalist social formations in the last hundred years or so: competitive industrial capitalism, already in demise as the hegemonic formation in the late nineteenth century, yet present still in the small business fringe and on the innovative frontier of new venture capitalism; the corporate industrial capitalism that took over hegemony in the late nineteenth century and persists today as a powerful, yet dependent, base of productive activity; and global finance capitalism, taking over the hegemonic, leading role in the reproduction of capitalism only in the 1980s and 1990s – the transition was hidden by the high-tech, information-technology, and Internet hype, which was part industrial, part media, part financial.

A more immediate terminology describes the institutions and ideologies that constitute more particular 'regimes' within (but sometimes transitioning between) capitalist social formations. Let us, for now, stay with the mundane world of 'policy regimes' – the political-economic mechanisms (institutions, ideologies, discourses) of power through which governmental and governance institutions try to direct social formations. A policy regime indicates: a systematic approach to policy formation proposed and managed by a set of government or governance institutions; dealing with a definable, limited range of leading issues; which prevails, as the dominant interventionary/regulatory framework; over a historical period lasting at least several decades. Policy regimes are lent coherence by underlying political-economic interpretations of the causes of a set of related socio-economic problems, interpretations that represent the interests of a fraction of capital. Institutions like the World Bank, the IMF and the WTO reflect and re-create these interpretations – they are interpretive agents, reflecting the old, helping to form the new. This 'interpretive moment' lends dynamism and some unpredictability to the sequencing of social formations (Peet 2007: 4–10).

For much of the nineteenth, and almost half of the twentieth, century, the capitalist countries were under a liberal-democratic policy regime that pretended to be unregulated and devoted to free trade. In

fact hegemonic states operated to increase the sphere of operations of capitalist enterprise: internally through government protection, subsidization and assistance; externally through imperial intervention and inter-state competition. As Ha-Joon Chang (2002, 2007) has pointed out, governments were integral to the development of all the leading industrial countries under nineteenth-century liberalism.

After the Second World War, the capitalist world entered a new political-economic policy regime: Keynesian democracy, predominating between 1945 and 1973. In the Keynesian policy regime, interventionist state and state-like apparatuses, like the IMF and the World Bank, committed to achieving full employment and high incomes for everyone, employed counter-cyclical and developmental macroeconomic policies within a basically free-enterprise (corporate) capitalism. This policy regime responded interpretively to the Depression of the 1930s, a crisis that delegitimized the theoretical rationality and the persuasive claims of the previous, long-lasting liberal policy regime, by using state and governance authority to stabilize accumulation and democratize economic benefits. Regional differences in theoretical-interpretative and political-economic tradition informed three main variants: social democratic Keynesianism in west European countries and their former settler colonies; liberal democratic Keynesianism in the USA; and developmental state Keynesianism in Japan and many industrializing Third World countries (Chang and Rowthorn 1995; Kohli 2004).

The years 1973–80 represent a transitional period, when interpretations of crisis and redirection contended for dominance. Advocates of neoliberalism won the day. The neoliberal policy regime revives late-nineteenth-century, 'free trade' liberalism, apparently by withdrawing the nation-state from macroeconomic management in favor of an increased reliance on market mechanisms. Yet as with its liberal, nineteenth-century predecessor, this apparent withdrawal of state from the economy disguises a movement that is better described as a redirection of governmental intervention toward serving multinational corporate interests, within an upward displacement of power to the global governance institutions, the IFIs initially, the G7/8 increasingly. 'Redirection,' however, is merely the gloss on a deeper process of ever-greater control over the state by wealthy people, corporations, banks and investment management companies, especially the investment banks under a system of 'managed democracy' that begins with control over the electoral process by big donors to political

campaigns, and control over the legislative process by lobbying groups (Peet 2007: 94–8).

The neoliberal policy regime responded positively to the globalization of economy, society and culture of the late twentieth century. Indeed, neoliberalism helped to organize the emergence of a globalization that benefits a newly re-emergent, super-wealthy, financial-capitalist class, residing mainly in the leading Western countries, but operating transnationally in terms of the range of its investment activity. Let us concentrate on the moment of interpretation within policy regimes seen as creative collective agencies in remaking capitalist society. Keynesianism interpreted the political-economic crisis of the previous liberal regime of the 1930s as stemming from fear about an unpredictable future. As we discussed in Chapters 1 and 2, for Keynes, uncertainty on the part of business owners led to inconsistent, delayed purchases of plant and equipment – that is, insufficient demand for capital goods. But things changed in the post-war period. The term 'Fordism' refers to an economy in which mass production is matched by mass consumption by unionized workers making good wages. Fordism is supposed to have been initiated by Henry Ford in the pre-First World War period – Ford produced the first assembly-line car and paid his workers more than the going wage so they could buy the product they were making. With the spread of Fordism, systemic deficiencies in demand originated more in inadequacies and instabilities in the mass purchase of consumer goods. In the context of post-war social and liberal democracy, states responded to under-consumption through Keynesian demand management. Policies centered on massive redistribution of income from rich people toward working-class consumer-voters – people who, by virtue of necessity and/or persuasion, *had to spend* every cent they got … and then more! The main device for income redistribution was progressive federal taxation of incomes – the marginal tax rate on the highest income bracket under the mildly Keynesian policy regime in the USA ranged from 70 percent to 92 percent in the years between 1945 and 1981. Instead of adding to stored wealth, income was recycled immediately into consumption. This kept the Fordist production-consumption cycle going and fueled high rates of economic growth. The IFIs, especially the IMF, were parts of this Keynesian governance system, controlling exchange rates, lending to Keynesian states with balance of payments problems, building infrastructure, and so on.

The convention is that, during the 1970s, Keynesianism, Keynesian

developmentalism and the Keynesian global institutions entered into crisis. The term used to describe this crisis in the First World was 'stagflation' – high rates of inflation coinciding with high rates of unemployment. Linked with this were balance of payments and currency crises – dealt with so arrogantly by the IMF that First World countries never borrowed from that institution again. In the Third World blame was placed on 'failed state intervention,' corruption, overspending and ineffective development. Further, the convention is that Keynesianism was quite simply replaced by a more effective neoliberal policy regime. But, as we have argued, analytical conventions are made from competing, interest-based interpretations, each given different purchase on decision-making by the political and cultural temper of the times. Recall that governments, economies, social systems and cultures in the West faced massive and continuous protests in the 1960s and 1970s. In the face of the escalating contentiousness that threatened social, cultural and political order, the capitalist elite committed itself to counter-revolutionary activity. 'During the 1970s, the political wing of the nation's corporate sector staged one of the most remarkable campaigns in the pursuit of power in recent history,' so that by the early 1980s 'corporations had a level of influence not seen since the boom days of the 1920s' (Edsall 1985: 107; Harvey 2005). An essential part of this was the propagation of an interpretation of economic crisis that found the main structural contradiction to lie in lack of investment in sluggish, underperforming economies. States responded through neoliberal economic policies centered on redistribution of income toward the rich who had so much they had to save and invest. Compared with Keynesianism with marginal tax rates of 70–90 percent, the neoliberal policy regime in the USA brought marginal tax rates on high incomes down to a range of 28–50 percent in the 1980s. The ideological guises of this redistribution were 'recovery, reform, growth,' terms that suggest a regime serving broad, popular national and international interests. The reality was stagnation in the real incomes of working-class and poor people. In the Third World the IFIs 'reformed the corrupt, ineffective state that accumulated too much debt' through neoliberal structural adjustment, again resulting in intense resentment.

What happened to the global economy under these two policy regimes, the Keynesian and the neoliberal? The measure used by conventional economists to measure 'well-being' is rate of economic growth – let us, for a moment, accept this measure at face value – i.e.

'growth is good.' Economic growth in the OECD countries, the richest countries in the world, averaged 3.5 percent a year in the period 1961–80, basically during Keynesianism, and 2.0 percent a year in 1981–99 (basically during neoliberalism). In developing countries the equivalent figures were 3.2 percent and 0.7 percent (Pollin 2003: 133). In other words, Keynesianism vastly outperformed neoliberalism. At the same time as economic growth slowed under neoliberalism, global inequality increased. In 1960 the 20 percent of the world's people living in the richest countries had thirty times the income of the 20 percent of the world's people living in the poorest countries; in 1973 the figure was 44 to 1; and in 1997 the ratio was 74 to 1 (UNDP 1999: 36–8). According to the World Bank (2004: 246–7), 971 million people living in the 'high income' countries and making up 15.5 percent of the world's population now receive $27.7 trillion in income, or 80.4 percent of the global income of $34.5 trillion, while 2,310 million people in the 'low income' countries, making up 36.8 percent of the world's population, receive $1.04 trillion, or 3.0 percent of global income. Putting this a little differently, the 'average person' living in the high-income countries now gets 63.5 times as much as the 'average person' living in the poor countries. National poverty rates in the low-income countries are in the range of 45–70 percent of the population, while the percentage of people living on less than $2 a day varies from 50 to 90 percent, depending on the country.

Yet geographic inequality only begins this sorry tale. Class, ethnicity and gender distribute incomes extremely unequally *within* countries. Of the 80 percent of global income going to rich countries, 50 percent typically goes to the highest-income 20 percent of the people, while the lowest-income 20 percent get 5–9 percent, again depending on the country. At the other end of the world, in the low-income countries, the richest 20 percent typically get 50–85 percent of national income, while the poorest 20 percent typically get 3–5 percent … of the 3 percent of global income that these poor countries receive (ibid.). One of the great but under-mentioned facts about global incomes is this: *poverty results from inequality*. Poverty increases as the world becomes a more unequal place. So, what has been happening to class inequality under neoliberalism? Take the case of the leading capitalist society, the USA, 'neoliberal model for the rest of the world.' Between 1947 and 1973, under the Keynesian policy regime, every income category of people experienced real income growth, with the poorest families having the highest growth in incomes of all groups. After

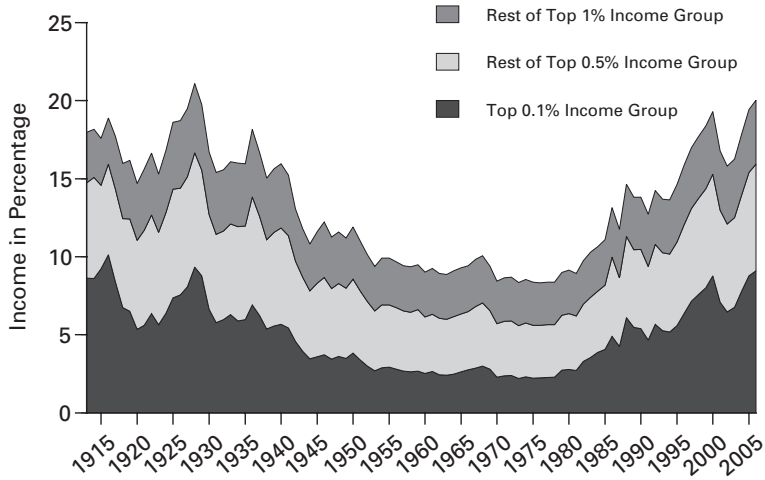

FIGURE 6.1 Percentage of income earned by three top brackets, United States, 1913–2005 *Source*: Statistics from Piketty et al. 2004

1973 average real income not only was stagnant, but that average reflected high-income growth for the top 20 percent of families, and significant income *decrease* for the poorest 20 percent, so that almost half of all families received lower real incomes by the mid-1990s than they had in 1973 (Leone 1996).

The key factor causing these secular changes in class incomes was an even greater divergence in the ownership of wealth, especially financial wealth – that is, bank accounts, ownership of stocks and bonds, and life insurance and mutual fund savings. Particularly important is ownership of stocks and mutual fund shares. Despite democratization (retirement savings invested in mutual funds, etc.) only 27 percent of US families own stocks. While 78 percent of the richest families own stocks and mutual funds, 3 percent of the poorest families do so. The equalizing trends in wealth ownership of the entire state interventionist period between the 1930s and the 1970s (New Deal, War Economy, Keynesianism) reversed sharply in the neoliberal 1980s, so that by 1989 the richest 1 percent of households owned almost half of the total financial wealth of the USA (Wolf 1996), a concentration of ownership that has only become more extreme since (Harvey 2005: 16–17). Within this rich 1 percent, the super-rich – that one thousandth of the population (145,000 people) making an average of $3 million a year – doubled its share of total national

income between 1980 and 2002, to 7.4 percent, while the share earned by the bottom 90 percent fell (see Figure 6.1). Or, putting this more starkly, the assets of the 200 richest people are greater in value than the assets of the 2.6 billion poorest people on earth.

Economic madness

This neoliberal policy regime helped to produce global finance capitalism. Since the late 1970s, income has deliberately been redirected toward people who *could not spend* it, no matter how hard they tried ($20 million apartments in financial centers that became real-estate price multipliers); they could only save and invest it. So under neoliberalism $1 trillion a year flows into the investment accounts of a few hundred thousand already very wealthy people (Johnston 2005). Financial institutions compete to use the investment funds over-accumulated by 'high net worth individuals' and by workers' savings in pension funds, insurance contributions, and so on. Corporations compete to attract investment capital not so much by offering high dividends, but by rapidly increasing the price of corporate stock. CEOs and corporate boards come and go, prosper or not, largely on the basis not so much of how effectively they run the corporation, but how much they can run up the price of the corporation's shares over a short period of time. Corporate capital experiences this competition for investment as an external compulsion originating in the dominant financial fraction of capital. CEOs who fail to deliver are subject to scrutiny by private equity firms that make their money by buying up 'non-performing' corporations, ruthlessly restructuring them (i.e. firing workers), and then selling to make a quick profit that yields high returns to investors. As this suggests, the reach of financial power (in all its aspects) has expanded outward, from its original, capitalist bases in the advanced industrial countries, onto a global playing field, where trillions of dollars range each day with ease and speed in search of the highest possible returns. Clearly, this global playground for capital is lined still with political and cultural boundaries. But increasingly, within the established, global investment space, countries are adjudicated merely as risk/benefit ratios and, by being included that way in the profit calculus, states are reduced in significance, except in acting as minders to the profit-seeking actions of global capital. This new version of finance capitalism is centered on the deployment of large accumulations of wealth by specialized institutions, such as investment banks and risk assessment firms,

concentrated in a few centers of financial power – the upper rank of 'global cities.'

Yet, even with ruthless profit raiding of corporations as modus operandi, the securities market is a relatively safe, stable investment outlet. This is because stock markets are, to some degree, regulated by states – in the USA by a government agency, the Securities and Exchange Commission, established in 1934, at a previous time of crisis. Investment management companies controlling collective assets in the form, for example, of mutual funds are also regulated in the USA under the Investment Company Act of 1940. Under neoliberalism, however, the super-rich have increasingly found ways of avoiding state regulation of investment. They do this partly by escaping national jurisdictions, as with the phantom corporate headquarters in places like the Cayman Islands. Global governance leaves this alone – the institutions they might try to regulate are more powerful than the IMF. The super-rich escape regulation at home by forming exotic investment vehicles. In the USA, investment funds open to small numbers (less than a hundred) of 'accredited investors,' and funds made up of 'qualified purchasers' (the qualification being over $5 million in investment assets), are not subject to governmental regulation, other than the registration of traders. So temporary investing in the equity market (the stock market), making a quick profit, and then selling competes with other, far more speculative, and lightly regulated hedge funds, private equity companies, sub-prime mortgage bundlers, futures, derivatives and currency traders, etc. In the context of globalization, 'emerging markets,' and exotic investment outlets, investment funds are expected to return at least 20 percent a year, doubling elite wealth every four to five years. So we live in societies where the dynamic of the leading fraction of capital is the pursuit, by any means possible, of more money for those who already have far too much. This reckless pursuit of money for the sake of more money is financial, global madness. It can result only in disaster.

For the price of high returns is … eternal risk. Any investment fund that does not generate high returns and, thereby, does not take extreme risk suffers disinvestment in highly competitive markets, where money changes hands in computer-quickened moments. So, there is a competitive compulsion to take increasingly daring risks in search of higher returns that temporarily attract investment. Speculation, risk and fear are structurally endemic to global financial capitalism. Indeed, 'fear itself' becomes the source of further speculation – buying

gold, or petroleum futures, for example. Speculation and gambling spread from Wall Street and the City of London into all sectors of society – house prices, state lotteries, casinos, church bingo nights, sweepstakes, buying Pokemon cards – everyone gambles, even little kids. The interlocking of speculations is the source of their intractability and the widening space of their effects. So the financial crisis of 2007/08 had the following component moments: vastly overpriced housing, particularly near booming financial centers; competition among financial institutions to offer easy credit to everyone; the bundling of home mortgages into tradable paper; very high levels of leveraging; the use of assets whose value can disappear in an instant to securitize other, even more risky, investments; interlocking bank failures or near-failures all over the world; the inability of governance to even think of managing all this. It is not just that crisis spreads from one area to another. Its more that crisis in one (such as the inevitable end to the housing price bubble) has exponential effects on the others (investment banks overextended into high-risk mortages) to the degree that losses accumulate that are beyond the rescuing powers of states and the governance institutions we have been looking at in this book. Hence the tendency for disaster to accumulate into catastrophe.

Civilization and global philanthropy

When speculation and gambling are normalized, the root source of value creation, labor performed on environmental resources, is lost to memory. Money appears (and disappears) from out of the speculative blue, rather than from knowable, seeable real activities. Unregulated financial speculation is the nearest we get to an economy driven by aggression and egoistic self-interest (see Freud 1966). Traders make more in a few seconds on the computer than 99 percent of the rest of us make through the hard, dedicated work of a lifetime. Workers are fired, homeowners dispossessed, but the fund manager does not witness these awful, terrible events, nor can he care. For plenty of others rush in where the ethical investor fears to tread. And if the intermediation of commodities in relations of production makes for an alienated society (Marx 1967: ch. 1), and the intermediation of images makes for a mesmerized society (Debord 2004), the intermediation of money and gambling in social relations makes for a mad global society. Even so, corruption and madness do not completely relieve global finance capitalism of the pangs of conscience. They just corrupt that 'conscience' and everything that emerges from its dubious morality.

In the Western, Calvinist tradition, philanthropy is the way rich people salve their consciences. In global finance capitalism an emotive, idealistic, moralistic veneer is added to this already exaggerated, philanthropic gesture. In the Fordist age of consumerism and advertising, people are attuned to image, suggestion and subjective exaggeration in all spheres of life, including the philanthropic. Image, media and spectacle play on popular concern, apparently to build support for grand action, but less obviously to channel what could mount into mass anger into safe and responsible, institutionally contained intervention. As we have seen, the symbolic turn of the millennium witnessed an escalation in sorrow, institutionalized in a global philanthropic complex that merges 'aid' with 'ending poverty' with 'development.' The geofinancial panopticon (O'Tuathail 1997) is mirrored in a geophilanthropic panopticon. The hegemonic capitalist countries, the IFIs (especially the World Bank), leading members of the global financial and industrial elite, famous academics, a dazzling array of pop stars … all the guilty parties want to 'end global poverty now.' At the IMF and World Bank, structural adjustment was renamed 'poverty reduction and growth.' The UN Millennium Declaration centered on halving extreme poverty by 2015. After mass, popular pressure, organized as Live 8 rock concerts, by singers Bono and Bob Geldof, the G7/G8 countries agreed to write off $40 billion owed to international agencies. In 2006, Warren Buffett, third-richest person in the world, pledged $31 billion to the Bill and Melinda Gates Foundation, started by the richest person in the world, aimed at ending global poverty. Over and over again, the UN says significant progress has been made toward achieving the goals of the Millennium Declaration, especially in the area of global poverty reduction. Even the WTO gets in on the anti-poverty crusade – so the Doha Round was said to need completing because more free trade would alleviate poverty in the poorest countries.

Can we accept these widely acclaimed acts of altruistic benevolence simply, in their own optimistic terms? Or is 'ending global poverty now … the world cannot wait' a civilizational gloss on the pursuit of more brutal, speculative self-interest? Rich countries look down on the poor and, in pitying them, devote themselves to 'ending global poverty' by declarative fiat or, when pressed, through safe means like education, funding anti-HIV/AIDs research, free mosquito nets, and so on. At the same time, ending global poverty is a disguise for extending the domain of global finance capital – it pacifies new spaces

of exploitation. In such ways, and more, are global finance capital, neoliberalism, global governance and the IMF and the World Bank's anti-poverty/debt relief policies linked.

The crisis of global governance

Even in this analysis, however, speculative global financial capitalism (madness), and its philanthropic gloss (civilization), is rendered insufficient by the onset of crisis. For it assumes that global capitalism has the time and the resources for acts of grace – the grand philanthropic gestures of the turn of the century, symbolized by the MDGs. Yet the scale and breadth of the financial crisis that began in 2007, and its intersection with global inflation in energy, food and raw materials, together with chaotic geopolitical conditions resulting from ill-conceived reactions to 9/11, all create a new miasma for which terms like stagflation prove insufficient. The new financial globalization allowed capital to escape the confines of what little remains of state regulation under neoliberalism to generate fantastic profit for the financiers. But the problem with escaping from regulation by the nation state is … who rides to the rescue at times of crisis? The answer in the past was the IFIs, particularly the IMF, the nearest we have to global economic regulators. The answer in the present and immediate future is the G7/8, although more realistically all the Gs are whizzing in divergent directions – G7 divided, G8 (Russia) unreliable, G4, G20, G90, etc. Even the biggest Gs, the USA and the EU, are probably insufficient given the size of global financial loss, the degree of debt, and the limits of state budgets.

But what of the IFI component of global governance? In retrospect we see the debt crises of the 1980s, and the regional financial crises of the 1990s, as preludes to the global financial crises of the 2000s. The response of the IFIs to the earlier symptoms of financial stress was more globalization – join the global neoliberal order, with our help, and your problems will disappear. The victims of this prescription resented it, the perpetrators (especially the IMF) were disgraced, the most aggressive proponents (especially the WTO) divided into squabbling blocs. Global governance IFI-style was already in crisis when, in 2007, global financial disorder set in. Hence global governance is riven by two intersecting contradictions. On the one hand, its monetary resources are hopelessly inadequate given the scale of global finance capital, the depth of its losses, and the multiplicity of its crises. On the other hand, confidence in its policy prescriptions

has long since eroded, so only a fool would lend the IFIs more money to solve the world's financial problems. The Bretton Woods period is over, its institutions are irrelevant, and the will to found a new global regulatory order is not there. So the World Bank sets a new tone that the other IFIs scramble to follow – Salvation Army to the world.

What is to be done?

Of course, global governance has faced crises before. Indeed, as Rajagopal (2000) argues, resistance by environmental and other social movements fed the proliferation and expansion of the IMF and the World Bank in the 1960s, 1970s and 1980s. And Broad (2006) adds that the Bank and the Fund are adept at paradigm maintenance. The present time, however, finds an already advanced process of destabilization of the hegemonic ideas of the Washington–Wall Street alliance within an overall crisis of global financial capitalism. A combination of crisis, destabilization and counter-hegemonic demonstrations has the global governors worried. Significant change seems at last to be realistically possible. What therefore is to be done about global governance in the post-September 11, post-financial-crisis era?

We have argued that the IMF and the World Bank, in league with the WTO and backed by the big corporations, especially the banks, impose economic policies on a hundred countries in the world which kill thousands of children every day in agony through malnutrition and preventable illnesses resulting from poverty and unemployment. This in the name of ending poverty for ever! So radical change has to deal with the beliefs and the mode of understanding that make such costly delusion possible on the part of (presumably) well-meaning IFI bureaucrats. Controversially, this means not only a critique of the rightist politics of neoliberalism, but a critique of the certainty that derives from a belief in the scientific validity of mainstream economics. We think that an objective economics likened to physics should be deconstructed, and replaced by one grounded in subjective judgment and likened to theories of culture – so markets are places not where atoms collide, but where representations contend. We suggest that a historical economics grounded more in empirical generalizations, with more attention to contexts and cases, would do more to end inequality and poverty than unrealistic mathematical elegance. Further, we think that the political and economic interests controlling global governance institutions and their policies, especially banking and the multinational corporations, should be further revealed to show that

policies damaging the poor result from considerations limited to the rich. We think that speculation should be replaced by planning as organizer of the economy. We find hope for the future in the construction of alternative economic models in Venezuela, Ecuador, Bolivia and Cuba. We think that the NGOs that watch and constantly criticize global governance should be supported and strengthened, and that thousands of demonstrators, well equipped with detailed knowledge, and fully prepared to discuss policy alternatives, should continue to greet every meeting where our world's future is discussed. Practically, we think that the IMF should revert to its original role as a place to deposit surpluses that can be withdrawn on demand, in hard currencies, as emergency loans. Failing this, the IMF should be disbanded. The WTO is a nasty organization run by directors and a secretariat that propagate rightist elitism in the guise of consumer populism. The WTO has either to be transformed into a fair trade organization, or it should be allowed to collapse in confusion, as it shows every sign of doing – either way, it has to go. And finally, we see some hope for the World Bank, were it to listen seriously to its many critics, and were it to undergo the changes that even its own conscience and many of its own staff suggest. The Bank's project lending did produce low-cost housing, clean water supplies and safe sewage disposal, where none existed before. The Bank's record on larger schemes, such as long-distance roads and high dams, reveals a conception of 'project' so limited that the consequences for those affected have to be disastrous – here the power of the bond-holders, and behind them that of the 'efficient' markets, has to be countered by the powers of the people. The Bank's association with the IMF after the mid-1970s, especially in the area of structural adjustment conditionality, tarnished its reputation, while half-hearted efforts at public participation have done little to improve its ethical position. The Bank's 'turn toward poverty' we find motivated more by paradigm maintenance than a real sense of global injustice. If the Bank aspires to end poverty, then the poor should be not sentimentalized, but included through their social movements in the process of planning their own development. For the Bank this means democratization, separation from what little remains of the IMF, and operation under an entirely different set of political-economic principles devoted to social justice.

In general we think that globalization has to be completely re-evaluated. This should be done in terms of the theories and policies that have directed it and the institutions that have managed it. The

potential for globalization to bring about a 'humanity appreciative of difference' has been made unrealizable by a real process of domination and the accumulation of hegemonic power. Rather than acting as agents of a more even, more equitable globalization, the institutions we have examined, the IMF, the World Bank and the WTO, have been captured by a neoliberal ideology that places them on the side of those who already have so much money they know not what to do with it. Globalization has to be directed into becoming something finer by a democratic alliance of social movements that opposes the alliance of the rich, the famous, and the gratuitously philanthropic. The idealistic critics are the realists at the present juncture, not the hard-headed expert insiders. There is lots of room, even in the present, limited structures of the institutions of global governance, for increasing popular participation and enhancing democratic decision-making. The idea is to widen the scope of this potential and to intensify its content. Only in so doing will global governance finally be transformed.

FOREWORD

At the dawn of the third millennium, as the nation prepares for its second war in the Persian Gulf in little more than 10 years, the same debate rages in this country that has defined it for the last three centuries: What exactly does it mean to be an American? Is America a place or a state of mind?

The British may love their language, and the French may love their gold, but Americans love more than anything to argue over who they really are. And in all that time, and all that arguing—from the dueling essays of Jefferson and Hamilton, to the confused politics of the Reform Party and Pat Buchanan—the American story has ultimately never strayed very far from the plotline that has energized it from the start.

You may devote a lifetime to peeling back the onion skins of the American Experience, as so many scholars have done, and no matter where you stop you will always encounter the same basic question that frames our history: In a democracy, what are the limits to legitimate power?

At its core, that is the question that informs *The Iron Triangle: Inside the Secret World of the Carlyle Group*—just as it eventually seems to inform our understanding of everything that ever happens in American public life, from the XYZ Affair to the Pentagon Papers. It is why one generation of Americans enacts the Sherman Antitrust Act, and a later generation eviscerates it. At the start of the 1950s, a screenwriter named Ring Lardner, Jr. was imprisoned as a Communist sympathizer; a generation later he was lionized in Hollywood as the screenwriter of M*A*S*H.

Of such moments is the history of this country eventually told, as Americans engage in the ceaseless pursuit of midcourse corrections to get where we want to go as a nation without becoming a tyranny in the process. When Richard Nixon lamented the nation's seeming obsession with "wallowing in Watergate," he missed the key point: As a nation and a people, we really had no other choice.

Now, in the winter of 2003, with America's wrath once again poised to strike down Iraq, a palpable sense is abroad in the land—not shared by all, but shared by enough—that we have somehow drawn a line in the sand where we never really intended to stand. How did we get to this moment anyway? In the visible mechanism of political cause and effect, part of what's happening feels hidden from view. We see the cause, and we see the effect. But the assembly of gears that transmits the power seems off somewhere else, in another room.

It is the work of scholarship—and in particular, of that uniquely American kind of contemporary scholarship that we call investigative journalism—to enter those darkened rooms and switch on the light so that all may see what is actually taking place. When the work is done well, and the message is true, we find ourselves in a diorama we never imaged could exist. One thinks in that regard of Jacob A. Riis's *How the Other Half Lives,* or more recently, and on a different stage entirely, Wise and Ross's *Invisible Government.* At other times, the exposes connect invisible dots, and in fairly short order are deservedly consigned to the ash bin of history as conspiracy theory. (Want to find yourself standing alone at a cocktail party? Then try suggesting that you have it on good authority that the Trilateral Commission actually runs the world.)

Briody's scholarship will meet no such fate, for not only are the facts of *The Iron Triangle* accurate, but the picture they present is also *true.* And just as *Invisible Government* in 1964 helped bring depth to our understanding of some of the missing gears that soon drove America into the jungles and highlands of Indochina, so too does *The Iron Triangle* introduce us to the men (and they are mostly just that) whose role in the geopolitics of the Middle East is now only glimpsed fleetingly, and never by design.

In the foreign policy apparatus of Washington, the Carlyle Group inhabits one of the most darkened rooms of all—hiding in plain sight in offices a mere five minutes' walk down Pennsylvania Avenue from the White House. Into this room, Briody has wandered uninvited and flipped on the light, to reveal the entire spin-cycle apparatus of post-public-sector employment that keeps the top men of successive administrations still gainfully employed in the fields they know best (typically aerospace and defense) once the boss has vacated the White House and returned to private life.

In this room, you'll meet the crude and brashly entertaining original founder of the Carlyle Group, Stephen Norris, a one-time hotel executive for the Marriott Corporation, who figured out how to exploit a late-1980s tax break passed for some Eskimos whose businesses kept failing, and parlayed it into a gimmick for monetizing the value of failure itself, and then marketing it as tax loss carry-forwards.

From this gimmick sprang the Carlyle Group—named by Norris and some chums after an organizing meeting they'd held in New York's Carlyle Hotel, as if the Group were nothing more than a piece of faux Regency furniture in need of a credential.

In these pages, you'll meet the relentlessly over-achieving David Rubenstein, now no longer the boy wonder bullet-biter of the Carter White House, where he held the title of Deputy Domestic Policy Assistant at the age of 27, and was said to have eaten three squares a day, for the entire four years, on junk food from White House vending machines.

You'll also come face-to-face with hatchet-faced Frank Carlucci ("Spooky Frank"), a man with a shadowy past including allegations that he began his career in the CIA with a foiled attempt to assassinate Patrice Lumumba in the Eisenhower years—something that Spooky Frank denies. You'll see him rise to deputy director of the CIA late in the Carter years, then "retire" early in the first term of Ronald Reagan's administration to become head of Sears World Trade—a company with a business that consisted, intriguingly, of neither deals nor revenues. Then, drawn back to Washington by the Great Revolving Door of government, Carlucci took a seat on the National Security Council, once again for Ronald Reagan, then

hopped over to Defense, finally spinning back through the door and into the private sector. At the end of Reagan's second term, he was settling behind his desk at the Carlyle Group.

You'll meet such figures as George Bush, Sr.'s one-time secretary of state, James Baker, who also joined the team, and even the ex-president himself, now a senior advisor to the Group.

And, for the first time anywhere, you'll go behind the scenes to see what this group really does as a "business." How it nails down deals, whose arms get twisted, and why. On the light side, you'll encounter comic relief figures like Prince Alwaleed bin Talal, who has promoted himself around the world as a top member of the Saudi royal family but has proved to be a spectacularly inept investor, pouring vast sums of Saudi money into dot-com stocks at the top of the boom.

More darkly, you'll enter the astounding—and until now almost entirely hidden—world of the Vinnell Corporation, which has been training the Saudi Armed Forces in how to protect their country's oil fields since the mid-1970s. There are now an almost unbelievable 45,000 private mercenaries working for Vinnell and outfits like it in place in the country. Vinnell was a Carlyle Group subsidiary from 1992 to 1997.

What is one to make of all this? Certainly enough to want to know more, which is why a book such as *The Iron Triangle* is such an important contribution: It puts the subject in play. A half century ago, Douglas MacArthur, having been summoned back to Washington from Korea by his Commander in Chief, Harry Truman, and relieved of his command over a dispute regarding his conduct of the war, stood before a joint session of Congress and declared, in one of the most memorable moments in American life, that "old soldiers never die, they just fade away . . ." after which he retired to the penthouse suite of the Waldorf Astoria Hotel in New York and was rarely seen in public again. Today, he would more likely have retired to the Carlyle Group, where he'd find a reporter named Dan Briody dogging his every move.

—Christopher Byron

March 2003

TIME LINE

February 1975—Vinnell Corp., a construction contractor and future Carlyle company, signs a $77 million contract to train the Saudi Arabian National Guard. The news touches off a controversy that would dog Vinnell, and then later Carlyle, to the present day, even after Carlyle sold off Vinnell to TRW in the mid-1990s.

December 1986—Frank Carlucci is named national security advisor to President Ronald Reagan, succeeding John Poindexter, who resigned in disgrace following the Iran-Contra scandal. While waiting to assume his responsibilities as national security advisor, Carlucci is briefly embroiled in an arms scandal of his own, when the *Washington Post* reports that Sears World Trade was involved in clandestine international arms deals while Carlucci was chairman.

September 1987—After making millions brokering deals that exploited an obscure tax loophole, Stephen Norris and David Rubenstein form the Carlyle Group, named after the posh Carlyle Hotel on New York's Upper East Side.

November 1987—Frank Carlucci is named secretary of defense by President Ronald Reagan. During his short tenure, Carlucci worked extensively on restructuring the Pentagon's procurement system, a system he would later exploit as chairman of the Carlyle Group.

July 1988—BDM, soon to be a Carlyle company, is accused by rivals of currying favor with the Navy officer in charge of procurement, Melvyn Paisley, by hiring his wife. Paisley would go on to

become the highest profile conviction of Operation Ill Wind, the years-long investigation into corruption at the Pentagon.

September 1988—Fred Malek resigns as chairman of the Republican National Committee after reports that while a Nixon aide, he compiled figures on the number of Jews working in the Bureau of Labor and Statistics. He immediately signs on with Carlyle.

January 1989—Six days after his term as secretary of defense ended, Frank Carlucci joins the Carlyle Group.

July 1989—Marriott Corp. sells its In-Flite Services catering business to Marriott's upper management. Carlyle invests in the deal, renames the company Caterair, and loses millions when the airline catering business evaporates in the early 1990s.

February 1990—George W. Bush joins Caterair board at the behest of Fred Malek, a good friend of his father's. Bush would later drop his disastrous experience with Caterair from his resume when he runs for governor of Texas in 1994.

September 1990—Carlyle Group buys BDM Consulting, one of the largest and most successful defense consultancies in the world. Carlyle would use the $130 million purchase to evaluate future buyouts in the defense industry.

January 1991—After months of contentious negotiations, Carlyle snags a board seat at Harsco, a maker of military vehicles. The seat would eventually help Carlyle to obtain Harsco's defense business, later known as United Defense.

February 1991—Prince Alwaleed of Saudi Arabia buys $590 million of stock in Citicorp, America's largest bank. Carlyle brokers the deal and gains a reputation as the merchant bank of choice for wealthy Saudis.

March 1992—BDM, a Carlyle company, buys Vinnell, a privatized military training company that does extensive work with the Saudi Arabian National Guard.

August 1992—Carlyle wins a year-long struggle over control of LTV Corp.'s defense and aerospace division, paying $475 million in

conjunction with Loral Corp. and Northrop Corp. The deal instantly legitimizes Carlyle as a serious player in defense buyouts.

September 1992—George Soros, a future Carlyle investor, brings the British economy to its knees by speculating on the demise of the British pound. When the value of the pound cratered on Black Wednesday, September 16, 1992, Soros pocketed a cool billion.

February 1993—A month after the Bush administration cleans out its desks at the White House, Richard Darman, the outgoing director of the Office of Management and Budget, joins the Carlyle Group in a package deal with James Baker III.

March 1993—After spending 12 straight years in the White House in various capacities under Reagan and Bush, James Baker III takes his considerable talents to the Carlyle Group, lending the firm instant international recognition and credibility.

September 1993—Carlyle snags its highest profile investor to date when George Soros invests $100 million in Carlyle Partners II, a fund that would go on to become the biggest and most successful of all Carlyle's funds.

December 1994—A *Washington Post* article exposes a secret arms deal conducted by BDM, a Carlyle company. In the deal, BDM used the same arms broker from the Iran-Contra scandal to arrange the transfer of Russian military equipment to the United States.

January 1995—Co-founder Stephen Norris is forced out of the company, accused by his colleagues of erratic behavior and fiscal irresponsibility. Norris faults his former colleagues for waging a smear campaign against him, spreading rumors and undermining his credibility to the financial community.

March 1995—University of Texas Investment Management Company, UTIMCO, weeks after George W. Bush became governor of Texas, places a $10 million investment into the Carlyle Group, which up until 1994, employed the young Bush.

September 1995—Onex Food Services buys Caterair from Carlyle for $500 million, nearly $150 million less than Carlyle had originally paid for the company.

November 1995—A car bomb attack on Americans living in Saudi Arabia puts a spotlight on Vinnell, BDM, and the presence of the Carlyle Group in Saudi Arabia. Three spouses of BDM workers are injured in the attack.

September 1996—Carlyle closes Carlyle Partners II at a total of $1.33 billion, more than twice its original target for the fund, and 13 times as much as the company had ever raised for a single fund. The defense-oriented fund would go on to produce returns of better than 35 percent.

September 1997—Carlyle buys United Defense for $850 million, one of the company's largest buyouts ever. United Defense has plans to build the Army a 60-ton mobile howitzer called Crusader.

March 1998—John Major, former prime minister of the United Kingdom, joins Carlyle as European advisor. He would later become chairman of Carlyle Europe in May 2001.

April 1998—Carlyle closes another $1.1 billion fund, called Carlyle European Capital Partners, at double its initial target. The company was able to raise the money in just under a year.

May 1999—Former President George Herbert Walker Bush visits South Korea on behalf of Carlyle, cultivating business and political ties that result in Carlyle's investing more than $1 billion in South Korea's struggling economy.

July 1999—Former Connecticut State Treasurer Paul Silvester is forced to resign his new position at Park Strategies after the FBI begins an investigation into a series of investments he made with Connecticut State Pension funds before he left office. Among the investments is a $50 million placement with Carlyle Asia.

September 1999—Silvester pleads guilty to corruption. Court documents are sealed, and the identities of the private equity firms involved are kept secret by the state, awaiting Silvester's sentencing, which is ongoing.

January 2001—SBC Communications, a Carlyle client, wins FCC approval to offer long-distance phone service in Texas, Oklahoma, and Kansas, after the Justice Department had rejected the

company's request. The approval is given on the last day of FCC Chairman William Kennard's tenure. Three months later, Kennard is given a job at Carlyle.

February 2001—George W. Bush, a month into his presidency, reverses America's policy of diplomacy toward North Korea, angering North and South Koreans alike, and threatening Carlyle's extensive investments in the region.

June 2001—Former President George H. W. Bush urges his son to reconsider his stance on North Korea, reminding him, among other things, of the U.S. business interests in the Korean peninsula. George W. Bush subsequently reverses his policy toward North Korea.

July 2001—Former President George H. W. Bush personally calls Crown Prince Abdullah of Saudi Arabia, reassuring the heir to Saudi Arabia that his son is "going to do the right thing" and "his heart is in the right place." The call is in response to George W. Bush upsetting the Saudi prince with his policy toward the Israeli-Palestinian conflict. It also helps protect Carlyle's extensive business in the region.

September 11, 2001—America sustains a highly organized attack by terrorists, leveling the World Trade Center towers, and ripping a gash in the Pentagon building. The attacks would lead to a massive increase in defense spending. A week after the attacks, Anthrax-laced letters are found throughout the East Coast, leading to heightened fears, and unexpected new contracts for Carlyle companies.

October 2001—Carlyle is forced to liquidate its holdings from the bin Laden family as news reports of the company's association with terrorist Osama bin Laden's estranged family overwhelm the press.

December 2001—Carlyle takes United Defense public after newly approved defense spending temporarily secures the Crusader's future. The company earns $237 million in one day on the sale of shares, and on paper made more than $800 million.

April 2002—Cynthia McKinney, a Democratic congresswoman from Georgia calls for an investigation into the September 11 attacks, pointing out the President's extensive ties with the Carlyle Group, a company that stands to make millions from the aftermath of September 11.

May 2002—The Army is forced to investigate whether its own officials illegally lobbied Congress in support of the Crusader in the face of the program's cancellation.

August 2002—United Defense issues an official press release announcing the cancellation of the Crusader program. The same press release announces the awarding of a new contract for United Defense to build another gun for the Army, effectively replacing Crusader.

November 2002—Lou Gerstner, the man who engineered IBM's stunning turnaround during the 1990s, is hired as Carlyle's chairman. The move is characterized by many in the media to change Carlyle's image from a defense oriented buyout firm to a more traditional private equity company. Frank Carlucci stays on as Chairman Emeritus.

CAST OF CHARACTERS

(in Order of Appearance)

Stephen Norris—co-founder Carlyle Group.

Norris was the driving force behind the creation of the company. A mercurial executive, bent on hunting down big deals, Norris ultimately would be forced out of the firm by his fellow co-founders in an acrimonious conflict.

David Rubentstein—co-founder Carlyle Group.

Still the brains of the operation, Rubenstein is widely considered one of the most intelligent men in Washington, DC. His IQ is surpassed only by his tireless work ethic and extensive Rolodex. He is what holds Carlyle together.

Dan D'Aniello—co-founder Carlyle Group.

A former colleague of Norris at Marriott, D'Aniello was brought on board only after Norris personally guaranteed his salary. He is among the more enigmatic, behind-the-scenes members of Carlyle, often serving as a buffer between the more explosive executives.

William Conway—co-founder Carlyle Group.

The son of a quality control guru and former chief financial officer at MCI, Conway is reputed to be one of the finest financiers in the world. His conservative style and waste-not approach would eventually clash with Norris's larger-than-life personality, resulting in Norris being sent packing.

Frederic Malek—former Carlyle consultant.

This former Nixon aide and close friend of George Bush Sr. ran to Carlyle after a furor erupted in Washington over his involvement in

the documented anti-Semitic actions of former President Nixon. He would go on to introduce Carlyle to some big names in Washington, but would later be excommunicated from the firm.

William Barr—former Attorney General.

A one-time law partner of David Rubenstein's, Barr would help Carlyle, along with Rubenstein, funnel millions of dollars through a temporary tax loophole known as the *Great Eskimo Tax Scam,* taking Carlyle into the Big Leagues.

Arthur Miltenberger—then chief investment officer of the Mellon Foundation.

As an original investor in Carlyle Group, Miltenberger was among the first to see the potential of an investment bank based in Washington, DC. His early contributions would get Carlyle on its feet.

J. W. Marriott—chairman of Marriott Corp.

The hotel magnate was once the boss of Steve Norris, Fred Malek, and Dan D'Aniello. The influence of Marriott on Carlyle was a pervasive force, and his former employees still utter his name with the highest respect.

Dan Altobello—former chairman of Caterair.

Yet another former Marriott employee, Altobello had the dubious honor of presiding over one of Carlyle's worst investments ever in Caterair. Like many others, he would clash badly with Norris, and later sell off Caterair at a loss.

George W. Bush—president of the United States of America.

An early hire of Carlyle, Bush was placed on the board of Caterair in 1990 and served for four years, before leaving to run for governor of Texas. His early stint with Carlyle would become a source of controversy later during his presidency.

Frank Carlucci—chairman 1989–2002, currently chairman emeritus of Carlyle Group.

A lifelong public servant, former secretary of defense, former deputy director of the CIA, and more, Frank Carlucci would lead Carlyle into the murky world of defense buyouts in the late 1980s and early 1990s. It is Carlucci's close friendship with Secretary of

Defense Donald Rumsfeld that the press most often seizes on when criticizing Carlyle.

Patrice Lumumba—former president of Zaire.

Assassinated after only two months in power, Lumumba would later become the subject of the film *Lumumba,* directed by Raoul Peck. In the film, there was originally a scene showing Frank Carlucci plotting the murder of the erstwhile leader. The scene was edited at Carlucci's request before the film's release.

Mobuto Sese Seko—former president of Zaire.

Chosen by Americans to succeed Lumumba, Sese Seko led Zaire into decades of famine and war. He remains part of Carlucci's legacy from his time as second secretary to the U.S. Embassy in Zaire.

Raoul Peck—filmmaker.

It was Peck's accounting of the murder of Patrice Lumumba that caused an uproar from Frank Carlucci. At Carlucci's request, Peck edited the scene that showed Carlucci plotting the assassination, but Peck stands by the film's veracity.

Donald Rumsfeld—secretary of defense.

A former college roommate and wrestling teammate of Frank Carlucci, Rumsfeld and Carlucci are never far apart. The two followed each other through the executive ranks of government, worked for Sears Roebuck together, and remain very close friends to this day.

Caspar Weinberger—former secretary of defense.

As one of Carlucci's many mentors, Cap Weinberger helped legitimize Carlucci, grooming him to one day become secretary of defense.

Roderick Hills—former CEO of Sears World Trade.

As the CEO of Sears World Trade, Hills fought off allegations of the company being a front for CIA activity and eventually resigned amidst huge financial losses, leaving Carlucci to succeed him.

Earle Williams—former CEO of BDM.

In leading BDM, a highly successful defense consultancy, Earle Williams curried favor with countless Washington, DC insiders,

among them Frank Carlucci. Carlyle would go on to buy BDM and make a killing.

Melvyn Paisley—former Naval officer.

When in the Navy, Paisley was in charge of awarding Navy contracts, a task he did while accepting kickbacks from defense contractors. He would go on to work for BDM, then get convicted after pleading guilty in the Ill Wind investigation into corruption in the Pentagon.

Vicki Paisley—Melvyn's wife.

Also an employee at BDM, Vicki was thought to be the reason that Earle Williams received a highly coveted appointment to the Naval Advisory Board.

Phil Odeen—chairman of TRW.

Williams' successor as BDM CEO, Odeen would grow the company into a highly successful and diversified consultancy. He was also CEO when BDM employees were targeted in a vicious car bombing in Saudi Arabia.

M. W. Gambill—former CEO of defense contractor Harsco.

The CEO of one of Carlyle's early takeover targets, Gambill would fight the fledgling buyout firm for control of Harsco, eventually conceding only a seat on the company's board.

Norman Augustine—former CEO of defense contractor Martin Marietta.

Augustine would go toe-to-toe with Carlyle over the heavily disputed takeover of LTV, an aerospace company spun out of Ford. After a protracted battle, Augustine and Martin Marietta would eventually lose out to Carlyle.

Prince Alwaleed bin Talal—Saudi Arabian prince.

A billionaire international investor, the Prince played a central role in raising Carlyle's name recognition, both at home and in Saudi Arabia. The Prince would go on to become close friends with Steve Norris, and make enormous investments in American companies.

King Fahd—king of Saudi Arabia.

As the leader of Saudi Arabia, King Fahd hired Carlyle companies to protect him and his family, as well as to manage the Saudi Economic Offset Program, a government-run program that brings foreign investment into Saudi Arabia.

Faissel Fahad—San Francisco lawyer.

This friend of Prince Alwaleed was responsible for making the key connection between Carlyle and the Prince, which led to the $590 million investment in Citicorp.

Prince Sultan bin Abdulaziz—Saudi Arabian defense minister.

According to a financial advisor to Prince Alwaleed, Prince Sultan bin Abdulaziz used Prince Alwaleed bin Talal as a front to invest money on his behalf, among others, in U.S. companies, like Citicorp. Prince Alwaleed denies the allegation.

Henry Jackson—former U.S. senator.

Jackson saw early on the perils of letting private companies contract with foreign governments on military missions. His investigation into Vinnell's deal with Saudi Arabia revealed a contract fraught with controversy.

Richard Secord—retired Air Force general.

An ex-employee of Vinnell, but better known as one of the Iran-Contra fall guys, Secord drew unwanted attention to Vinnell when he was implicated in trading arms for hostages.

James Baker III—Carlyle managing director, senior counselor.

The former secretary of state under President George Bush Sr. led five different Republican presidential campaigns, and spent 12 straight years in the White House during the Reagan and Bush administrations. He took a position with Carlyle in 1993, and would later lead George W. Bush's successful battle for the presidency during the Florida recounts.

Richard Darman—Carlyle executive.

The former director of the Office of Management and Budget under Bush Sr., Darman wrangled his way into a position at Carlyle by including himself in a package deal with Baker.

Colin Powell—secretary of state.

A former Carlyle advisor, Powell's role in Carlyle's history is a bit of a mystery. Most believe that he merely advised the company while he was not in public office. One of his early mentors was Frank Carlucci, and the two remain close.

Michael Eisner—chairman of Walt Disney.

Eisner was involved with a deal between Prince Alwaleed and Euro Disney, in which Norris negotiated a huge investment from the Prince. Eisner was among the many that found Norris undisciplined.

Antonio Guizzetti—Italian business man.

After meeting Steve Norris in a sauna at a Washington area gym, Guizzetti led Norris and Baker on a wild tour of Italy in search of the perfect investment. Ultimately, the investment they had targeted fell apart when Norris resigned in the middle of negotiations.

Basil Al Rahim—former Carlyle employee.

In charge of raising capital in Middle East during the early 1990s, Al Rahim was the man who introduced Carlyle to members of the bin Laden family, a relationship that would later cause both parties discomfort.

George Soros—Carlyle investor.

This internationally respected investor and speculator helped legitimize Carlyle when he committed $100 million to the Carlyle Partners II fund. The sizeable investment was accompanied by Soros' public endorsement of Carlyle.

John Major—chairman Carlyle Europe.

The former prime minister of the United Kingdom, Major came on board with Carlyle during a fevered spate of highly political hirings by the company. Since then he has spent time stumping for Carlyle throughout the world.

Paul Silvester—former Connecticut state treasurer.

Silvester is awaiting sentencing after pleading guilty to corruption charges while working as the state treasurer of Connecticut. In his

final two months in office, after losing reelection, Silvester invested $800 million of the state's pension fund in several private equity firms for which he received kickbacks. One of the firms he invested in was Carlyle, which was investigated, but no charges were brought.

Wayne Berman—president of Park Strategies.

A consummate Washington insider, Berman is a major financial backer of George W. Bush, as well as the president of Park Strategies, the company that hired Silvester after he invested Connecticut's pension funds through his firm.

Denise Nappier—Connecticut state treasurer.

Stepping into the mess that Silvester left behind, Nappier required that all firms doing business with the Connecticut state pension fund disclose their finder's fee arrangements. After initially holding out, Carlyle disclosed a $1 million fee to Wayne Berman.

Thomas Hicks—founder of Hicks, Muse, Tate & Furst.

This Texas billionaire and George W. Bush backer was responsible for taking the University of Texas' asset management private and investing the school's money with various Republican-friendly firms, including Carlyle.

William Kennard—Carlyle managing director.

The former chairman of the Federal Communications Commission (FCC), Kennard approved a highly questionable bid by SBC Communications, a Carlyle client, to enter into long-distance markets days before he left office. Two months later, he landed a job with Carlyle.

Frank Yeary—Carlyle managing director.

A former investment banker at Salomon Smith Barney, Yeary used his extensive connections at SBC to get Carlyle business there.

Arthur Levitt—Carlyle senior advisor.

The former chairman of the Securities and Exchange Commission (SEC) was known for his policy that protected the individual

investor and railed against corporate malfeasance. The irony of his current position with Carlyle is less than subtle.

George Herbert Walker Bush—Carlyle advisor.

The former president of the United States of America has been the source of the majority of Carlyle's controversy. His visits with world business leaders everywhere from Saudi Arabia to South Korea and his repeated influence on American foreign policy make him an easy target for public advocacy groups, who accuse him of influence peddling and damaging conflicts of interest.

Park Tae-joon—Carlyle advisor.

This former prime minister of South Korea was instrumental in securing Carlyle's extensive business interests in the Korean Peninsula.

Michael Kim—Carlyle managing director.

The son-in-law of Park Tae-joon, Kim runs Carlyle's Korean operations, and spearheaded the successful buyout of one of Korea's few healthy banks, KorAm.

Crown Prince Abdullah—heir to the Saudi Arabian throne.

Upset with George W. Bush's pro-Israel policy, Prince Abdullah received a phone call from the president's father, George H. W. Bush, reassuring him that his son was okay, and that George W.'s "heart is in the right place."

Tom Fitton—president of Judicial Watch.

A died-in-the-wool Clinton hater, Fitton caused a stir in Washington when he came out publicly against George H. W. Bush's involvement with the Carlyle Group. His efforts to obtain documents from the federal government have produced some of the most tangible evidence of Carlyle's influence yet.

General Shinseki—U.S. Army chief of staff.

In favor of a more mobile and agile army, General Shinseki originally presented the argument that would ultimately kill United Defense's Crusader, a 42-ton howitzer on wheels.

Andrew Krepinevich—executive director of the Center for Strategic and Budgetary Assessments.

As a member of the Congressionally appointed 1997 National Defense Panel which analyzed military spending, Krepinevich came out against the further development of Crusader, citing the gun's weight and obsolescence as his reasons.

Milo Djukanovic—president of Montenegro.

In searching for support to pursue independence for his country, Djukanovic lobbied the American government to no avail. But he found an ally in Frank Carlucci, who met with Djukanovic and then lobbied his former understudy, Colin Powell, to consider Djkanovic's requests.

Frank Finelli—Carlyle employee.

A retired Army colonel, Finelli is perhaps the most mysterious of all Carlyle's employees. He was instrumental in working with lawmakers to push through incremental approvals of the Crusader program. He has been characterized as a "behind the scenes" type that "works in the dark."

Shafiq bin Laden—estranged half-brother of Osama bin Laden.

Shafiq is the representative to Carlyle for his family's investments with the company, and as such, was at the Carlyle annual investor conference in Washington, DC, on September 11, 2001.

Cynthia McKinney—former democratic representative from Georgia.

McKinney was an outspoken critic of Carlyle and was openly ridiculed for voicing her concerns that people close to the George W. Bush administration stood to gain financially from the ongoing war on terrorism.

Chris Ullman—Carlyle spokesperson.

Hired only after the ironies of Carlyle's bin Laden ties were discovered *after* September 11. Ullman has been a busy man, trying to hold back a barrage of negative criticism.

Paul Wolfowitz—deputy secretary of defense.

Recently profiled by the media as the man behind Bush's war fetish, Wolfowitz is also reported to be the man that killed the Crusader, not Rumsfeld. Regardless, United Defense felt no pain from the cancellation of the program when the company was awarded another contract to build a different gun the very same day.

Louis V. Gerstner Jr.—chairman of Carlyle, former IBM chief executive.

At IBM, Gerstner earned a reputation as a driven executive, directing Big Blue through an unforgettable turnaround, restoring the company's reputation as a global behemoth. It is anticipated that he will only spend 20 percent of his time on Carlyle, advising on two funds and mentoring senior managers.

PROLOGUE

MEET THE CARLYLE GROUP

A vast interlocking global network.

—Carlyle marketing material, circa 2001

It is hard to imagine a more concentrated display of wealth than Manhattan's Upper East Side, where building after building reeks of money, power, and prestige. Multimillion dollar homes share Madison Avenue sidewalks with lavish galleries, ritzy boutiques, upscale nannies, and purebreds. But even against this extravagant setting, the Carlyle Hotel stands out. Its tower rises unapologetically into the sky, lording over Central Park and dominating the skyline around it. The blue-blood interior with lush carpeting and hushed tones perfectly suits its high-end clientele. It is a place for those accustomed to success and comfortable with luxury. In a city full of opulent hotels, it is among royalty.

So it is altogether fitting that the Carlyle Group would assimilate the name of this regal residence when banding together in the summer of 1987. At the time, co-founders Stephen Norris and David Rubenstein met often at the hotel on 76th Street and Madison Avenue. They wanted the name of their company to sound like old money, and the Carlyle moniker fit the bill. But little did either co-founder know, the Carlyle Group would go on to become one of the most powerful and successful private equity firms in the world, with over $13 billion under management and more political connections than the White House switchboard. In its 15 years of existence, the Carlyle Group has become the corporate embodiment of

the hotel it was named after: a towering presence in a world of wealth, power, and politics.

Today, the Carlyle Group is a story of dealings inside the "Iron Triangle," the place where the world's mightiest military intersects with high-powered politics and big business. It is a company whose history includes ties to CIA cover-ups and secret arms deals, and an astounding trail of corporate cronyism. By making defense buyouts the cornerstone of its business strategy, Carlyle now finds itself the beneficiary of the largest increase in defense spending in history. Indeed the stars seem to have aligned perfectly for Carlyle, in just 15 short years. With the ascension of George W. Bush to the presidency, the White House is now full of ex-Carlyle employees, friends, and business partners. And with the newly fattened defense budget, Carlyle has been able to extract massive profits from its defense holdings, like United Defense, in the wake of the terrorist attacks on September 11, 2001. It may be tough times for America, but as Bette Midler might say, everything's coming up Carlyle.

While the company flew well under the radar screen for the first decade of its life, lately success has not come without scrutiny for the Carlyle Group. After all, it's hard to remain anonymous when your employee roster includes names like George Herbert Walker Bush, James Baker III, John Major, and Arthur Levitt. It's also difficult to avoid those pesky accusations of corporate impropriety, conflict of interest, and influence peddling when your chairman emeritus is former defense secretary Frank Carlucci, a man who has courted controversy his entire life and spent his years at Princeton University bunking with his close friend Donald Rumsfeld, the current secretary of defense. Even George W. Bush and Colin Powell put their time in with the Carlyle Group. After years of doing business with everyone from the Bushes to members of the bin Laden family, Carlyle executives have now found their fortunes being accompanied by the cries of conspiracy.

Some critics charge that the company practices nothing more than "access capitalism," trotting out big names that bring in big money. Some call it "The Ex-Presidents Club." Some worry that it is influencing domestic and foreign policy. And some, including former Georgia congresswoman Cynthia McKinney, even implied that President Bush allowed the events of September 11 to take place to

enable him to dictate policy that would benefit the Carlyle Group. But no matter how deep your suspicions run, the Carlyle Group warrants close examination. That a company like the Carlyle Group even exists is testament to the irresistible temptation for ex-politicians to cash in on their time as public servants, in ways that to some seem less than scrupulous.

The Carlyle Group has established a number of firsts in America, including:

- It is the first time a former president has toiled on behalf of a defense contractor.
- It is the first time that a former president advised his son, while holding office, on foreign policy decisions that directly impacted both of their financial fortunes.
- It is the first private-equity firm of its kind to be based in Washington, DC, rather than the traditional haunts of New York, or even Chicago.
- It is the first company to assemble a cast of characters that even *X-Files* writers couldn't have dreamed up. Besides the impressive domestic roster of political heavyweights, Fidel Ramos, former president of the Philippines is a senior advisor. Park Tae-joon, former prime minister of South Korea was also a senior advisor. Former Thai Premier Anan Panyarachun also worked for the company.

If the thought of all of these men working together outside the fishbowl of international politics makes you uneasy, you are not alone. Political watchdog groups, like the Center for Public Integrity and Judicial Watch, have long been howling over the potential for corruption at Carlyle. The company has been investigated by the FBI, excoriated by representatives, sued by political activists, and embarrassed by scandal. Yet the Carlyle machine hums along, doing what it does best: making gobs of money for investors. Watchdogs might as well be barking at the moon, because the scandal here is not what's illegal, but what's legal.

In a time when the ties between high-ranking politicians and billion-dollar businesses has the country on edge, bracing for the next corporate scandal, and waiting for the political shoe to drop, the

Carlyle Group has come to symbolize the extent to which many of these relationships continue unchecked. And when accusations of war-profiteering ring out, Carlyle is usually at the top of most people's list of guilty parties. Coincidence and circumstance only go so far in explaining the unbridled success of this company. Connections, cronyism, and cunning fill in the gaps. Far more disconcerting to the discriminating investor is the fact that Carlyle has become the model for a new generation of investment banking in which former politicians are brought in at high-level positions to butter up investors, foreign heads of state, and business partners. Why else would Los Angeles–based Metropolitan West Financial appoint Al Gore, with zero professional investment experience, its vice chairman? Investment banks are learning that the Carlyle model pays.

But it is Carlyle's particular style of investing that has raised eyebrows. Concentrating on heavily regulated industries like defense, telecommunications, energy, and health care, Carlyle is betting that it can predict future trends in government spending and policy, or influence them outright. And by hiring former secretaries of defense, ex-presidents, the former head of the Securities and Exchange Commission, and the former chairman of the Federal Communication Commission, they are in a position to do either.

Dwight D. Eisenhower, upon leaving the office of president in 1961, warned future generations against the dangers of a "military-industrial complex," and the "grave implications" of the "conjunction of an immense military establishment and a large arms industry." He went on to presciently say, "In the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military industrial complex. The potential for the disastrous rise of misplaced power exists and will persist. We must never let the weight of this combination endanger our liberties or democratic process."

The wisdom of these comments has clearly been lost in the 40 years since Ike left office. The first step toward turning things around is understanding how we got here. No single company can illustrate that progression better than the Carlyle Group, a business founded on a tax scheme in 1987 that has grown up to be what its

own marketing literature once called "a vast interlocking global network." The company does business at the confluence of the war on terrorism and corporate responsibility. It is a world that few of us can even imagine, full of clandestine meetings, quid pro quo deals, bitter ironies, and petty jealousies. And the cast of characters includes some of the most famous and powerful men in the world. This is today's America. This is the Carlyle Group.

1

THE POLITICIAN, THE BUSINESSMAN, AND THE UNLUCKY ESKIMOS

It was a great scam.

—Stephen Norris, co-founder
Carlyle Group, May 20, 2002

Cast of Characters

Stephen Norris	Co-founder Carlyle Group.
David Rubenstein	Co-founder Carlyle Group.
Dan D'Aniello	Co-founder Carlyle Group.
William Conway	Co-founder Carlyle Group.
Frederic Malek	Former Nixon aide, close friend of George Bush Sr., and current CEO of Thayer Capital.
Jimmy Carter	Former president of the United States.
William Barr	Former attorney general and law partner of David Rubenstein.

Stephen Norris is getting excited now. Even today, recalling the events that led to the formation of the Carlyle Group, the company that would eventually come to represent Norris' legacy, gives the 53-year-old Washington dealmaker a thrill. Though they didn't know it at the time, co-founders Norris and David Rubenstein, a young staffer from the Carter administration, were embarking on the ride of a lifetime.

With a nose for the big deal, the cocksure Norris is, by his own admission, a difficult man to get along with. His time with the Carlyle Group, ending abruptly in January 1995, was marked by tension, competition, and conflicting egos. He is a man with casual disregard of those with whom he is conversing. His eyes flit around the room. He looks at everything but you. He talks freely, with no fear of consequence, and rarely pauses for a retort. He talks over you. Athletic, fit, handsome, and with a healthy taste for the good life, Norris speaks longingly, even boastfully, of his time with the Carlyle Group, fondly recalling his blockbuster deals with rich Saudi princes and Fortune 500 companies. He is, and always has been, a man that swings for the fences.

In late 1986, Norris, then an executive with Marriott's mergers and acquisitions group and a tax whiz, got wind of a little-known tax loophole that allowed Eskimo-owned companies in Alaska to sell their losses to profitable companies. The origin of the loophole dated back to 1971, when Alaskan natives arrived at a unique settlement with the federal government over ownership claims of Alaskan land. Typically, when Native Americans sued the U.S. government over the atrocities committed during the nation's "manifest destiny" era, the settlements revolved around land, otherwise known as reservations. The logic went that if the government could return some portion of the land they stole in claiming America for themselves, the irreparable cultural damage done to Native Americans in the process would somehow be forgotten. But the Eskimos weren't buying it. Unlike Native Americans in the lower 48 states, Alaska's natives eschewed the traditional award of land reservations. Instead, the Alaskans chose cash. Under a unique settlement, Alaskan natives were allowed to set up native-run corporations to invest and manage the money they had been awarded. In the end, the Eskimos and other native Alaskans ended up with $962 million to manage as they saw fit. They also managed to negotiate for 44 million acres

of land on which to run their businesses. It was the price paid to them for decades of oppression, and they took it.

Because of some bureaucratic foot-dragging and truly unfortunate timing, the newly formed corporations missed out on Alaska's boom time in the mid-1970s. Fishing, timber, and oil, three of the local industries most companies were set up around, experienced major downturns. Many of the companies fell prey to mismanagement, investing in foolish pursuits like tire manufacturers, concrete plants, and hotels. Even though they had chosen their own fate, the owners of the companies felt they had been set up to fail. More than 180 companies had been formed out of the settlement. Only one managed to consistently turn a profit. It was a total disaster.

The companies soon found themselves facing huge losses, and limited options for turning things around. In 1983, Alaskan Senator Ted Stevens worked to save his floundering constituency by incorporating a clause in the 1984 tax bill that allowed the Alaskan-owned companies to leverage their losses by selling them to profitable companies looking for a break on their taxes. Essentially, if an Alaskan company lost $10 million in a fiscal year, they would sell the losses for $7 million in much-needed cash. The buyer would then write the losses off against its profits, getting a $10 million tax credit for just $7 million. Everyone's happy, except, of course, the government. Norris smelled money. But he needed help from someone. Someone with exceptional connections. Someone that knew everybody, including some Alaskan Eskimos.

Someone like David Rubenstein.

Rubenstein: Carlyle's Beating Heart

Ask enough people about David Rubenstein, and you start to hear the same descriptors over and over: brilliant, driven, tireless.

Norris still maintains an objective respect for Rubenstein, with whom he joined forces in 1986. Rubenstein had been toiling as a Washington, DC, lawyer for six years with the mergers and acquisitions groups at Shaw, Pittman, Potts & Trowbridge and G. William Miller & Co. when Norris came calling. Norris, who often transitions seamlessly between utterly eloquent and outright crude, calls Rubenstein "indefatigable, "indomitable," and "f**king brilliant." Rubenstein would go on to become the very heart and soul of Carlyle, driving the company forward through clashing egos and countless near-scandals.

After graduating from the University of Chicago Law School in 1973, Rubenstein worked his way up the political ranks with blazing speed. At the tender age of 27, he became the deputy domestic policy assistant to President Jimmy Carter. He was the first person in the office in the morning, and the last to leave. One of the most widely circulated stories about Rubenstein is that he survived solely on vending machine fare during his time at the White House, a claim he does not refute. He strongly believed in the nobility of being a public servant. He was young, idealistic, and most of all, innocent.

In the spring of 1980, Rubenstein filed a memo to the president late one night. Before he left to go home—some thought that he was actually living in the White House due to his late hours—he remembered something he had intended to add to the memo, and went into the president's office to fetch the document. After shuffling through some papers in the president's inbox, he found the memo, amended it, and returned it to the stack. The next morning, President Carter questioned Rubenstein about his late-night foray into his office, asking him pointedly and repeatedly what he had seen while he was there. Rubenstein truthfully told the president that he simply got his memo, and then returned it, seeing nothing in the process. As it turns out, atop the stack of papers on Carter's desk, were the plans for the ill-fated rescue attempt of America's Iranian

hostages in April 1980. The story, related to me by Norris, demonstrates Rubenstein's early naiveté. It also foreshadows the paranoia that some say has grown inside him over the past 20 years in Washington, DC. "He sees conspiracies," says Norris.

After Carter lost to Reagan in 1981, Rubenstein was released into the world of high-priced beltway lobbyists. It was a business that insulted Rubenstein's renowned intelligence and underutilized his many talents. His distaste for the work was captured in a 1993 article in *New Republic,* where he was quoted as saying, "I found it demeaning, it was legalized bribery." His opinion of lobbying would change later in his career.

Rubenstein would soon be delivered from the tedium of Washington influence peddling, when Norris, while still working for Marriott, contacted him, looking for a way to cash in on what would come to be known within Carlyle as the Great Eskimo Tax Scam.

Norris' entire job at the time was to scour tax law and find ways to save Marriott millions. He hired Rubenstein and William Barr, the man who would go on to become attorney general from 1991 to 1993, from Shaw, Pittman, Potts & Trowbridge, a Washington law firm that had represented Marriott on the Hill in the past. Along with his relentless work ethic, Rubenstein had also garnered a reputation for his extensive Rolodex. When Norris asked him if he knew any native Alaskans, Rubenstein had no problem coming up with some names.

Marriott ended up paying Rubenstein and Barr a seven-figure fee for their help in saving them a bundle on their taxes in 1986. Norris, after reading the tax bill closely, decided there was a much greater opportunity here than just this one-shot deal. He figured if Rubenstein and Barr could make out so handsomely for their limited role in facilitating Marriott's tax relief, he could, too. Norris left Marriott and set up shop in Seattle to pursue the deals, all the while talking to investors about opening up a little business of his own.

Before long, Norris and Rubenstein were flying Eskimos into Washington, DC, buttering them up, and brokering deals between them and profitable American companies. Finding the loss-making Eskimos was easier than either of them had imagined, and the profitable counterparts couldn't get enough of the free money. Norris and Rubenstein took a 1 percent cut of the transactions and sent an estimated $1 billion through the loophole. A cottage industry had been born. After clearing close to $10 million, Norris and Rubenstein recognized the ongoing potential of the business, and decided to incorporate. For corporate representation, the two hired none other than Ron Astin of the venerable Houston law firm Vinson & Elkins. (Astin would later find himself testifying before Congress about offshore partnerships he had helped set up for Enron.) With the crew in place, liabilities limited, and money coming in the door, the boys were ready to make something of themselves. All they needed now was a name.

During this time, Norris and Rubenstein frequented the Carlyle Hotel in New York. Norris loved the place. It was the kind of over-the-top lavishness he couldn't get enough of. It had a high-roller feel to it. His hero, Andre Meyer, the legendary head of investment bank Lazard Freres, had lived there for years. Norris felt the name lent the company a silk-stocking air. After selling Rubenstein on the idea, the Carlyle Group was born.

That the Carlyle Group was formed out of a temporary tax loophole, which was eliminated a year later, is utterly appropriate. David Rubenstein, as dedicated a public servant as there ever was, saw fit to found his company on a scheme that denied the federal government close to $1 billion in taxes. It was the first of many ironies that would compromise Rubenstein's political roots as his career with Carlyle progressed. As with many of the Carlyle Group's future deals, the Great Eskimo Tax Scam was entirely legal. Whether it was ethical, is another question.

The tax loophole unwittingly encouraged Eskimo companies to overstate their losses, and the IRS was called in to investigate. A discrepancy between "hard" and "soft" losses arose. Corporate appraisers took liberties in estimating the loss in value of certain goods, like timber and oil. Suddenly everyone in Alaska had losses for sale. It was a bonanza for accountants. Though no charges were ever filed, the case portends the current corporate malfeasance in America, in which companies inflate revenues and earnings through marginally legal accounting.

It bears mentioning that in certain cases, the tax loophole actually did what it was intended to do. Some Alaskan companies took the capital they received and reinvested, saving themselves from certain bankruptcy. Finally, however, just before Carlyle could complete a $500 million deal with a company called Cook Inlet, the government had seen enough of its money wasted, and sewed up the hole. It was the end of a great scheme for Carlyle, and it would be the last easy money the company saw for half a decade.

Goin' Legit

After the tax loophole closed, Norris and Rubenstein briskly went about building an empire. They brought Dan D'Aniello over from Marriott, whose salary Norris personally guaranteed. They also signed up William Conway, a former chief financial officer at MCI Communications. Funding for what Rubenstein was pitching as a leveraged buy-out firm came mainly from Pittsburgh's wealthy Richard K. Mellon family and Ed Mathias at T. Rowe Price, the Baltimore-based investment bank. It only took $5 million to get them on their way.

It was the go-go 1980s, and big business was flying high. Leveraged buyouts were the name of the game. This particular brand of cut-throat business consisted of big banks borrowing billions,

acquiring huge positions in struggling companies, snatching them up on the cheap, and selling them off for parts or turning them around. Everyone was getting rich and Rubenstein was itching to get a piece of the action. He would later confess to a reporter that "I thought I had a pretty good IQ myself, and people were making a lot more money than me who I thought maybe weren't so smart."

The most important thing for buyout firms, otherwise known as private equity firms, is raising capital. The more money a given firm can raise, the more successful it can be. Like a mutual fund, a buyout fund collects money from a number of sources—wealthy individuals, institutional investors, pension funds—then invests it on their behalf. But instead of investing in stocks, buyout funds buy companies, with the intention of turning them around and selling them for a profit. Typically, the companies are bought with a mix of capital and debt, somewhat mitigating the risk of the buyer. Hence, the leveraged buyout, or LBO, nickname. The companies are then held in a portfolio, or fund, which usually has a target market or theme. It can be a dangerous form of investing, open only to the extremely wealthy. Minimum investments in a given fund are usually no less than $1 million, and returns are generally expected to be more than 25 percent, usually within 10 years, sometimes less. Downside can be that much and more. LBOs are not for the faint of heart.

The Carlyle Group based themselves in Washington, DC, instead of the more traditional buy-out firm haunts of New York or Chicago, a move that surprised many in the business. Arthur Miltenberger, then chief investment officer of the Mellon Foundation, would tell *Forbes* at the time, "I was intrigued by a merchant bank based in Washington, DC, because foreigners have to come to Washington." Upon incorporation, Carlyle hardly registered a blip on the radar of older, more established buyout firms like Kohlberg Kravis & Roberts and Fortsmann Little.

It was clear from the outset that what the Carlyle Group had to offer that was different from its more incumbent competitors was its access. Newspapers heralded the rise of a new breed of dealmaker: the access capitalist. Indeed, the Carlyle Group's first deals reflected the relationships that its founders had fostered. Carlyle took a $35 million stake in Consolidated Entertainment, a company that was part-owned by Gerald M. Rafshoon, a former Carter administration advisor. The company was planning a six-hour miniseries for HBO called "The Great Satan," a detailed account of Ayatollah Khomeini and the Iranian hostage crisis, a topic that Rubenstein knew all to well. But it soon became apparent that it takes more to succeed in the world of high finance than a political pedigree and a bunch of swell friends.

The company stumbled its way to a disastrous early record, overpaying for ill-advised investments, and getting beat out by more nimble competitors on the only deals that had potential. In 1987, Carlyle launched a takeover bid of the Mexican restaurant chain Chi-Chi's, only to be outbid by Foodmaker. Then again in 1988, Carlyle began accumulating shares of Fairchild Industries, a Virginia-based defense contractor, only to be out-bid by Banner Industries, which up until that point had been in partnership with Carlyle. It was a bruising introduction to the world of high finance. Though the company made about $10 million in stock profits on both deals combined, they were discovering the hard way how the leveraged buyout game was played.

Counting the Jews

Then in September 1988, the Carlyle Group would get an infusion of experience, and controversy, when Frederic V. Malek, a former personnel chief for President Nixon, signed on. Malek, nicknamed "The Ax" for his days as Nixon's strongman, managed

Norris and D'Aniello at Marriott in the early 1980s. Close friends with George H. W. Bush, Malek had just been rewarded for coordinating Bush's New Orleans convention with a position as deputy chairman of the Republican National Committee (RNC) in August 1988. But the excitement was to be short-lived. Less than a month after Malek's appointment, scandal erupted in Washington.

In early September 1988, the *Washington Post* reported that in July 1971, operating under instructions from President Nixon, Malek had compiled figures on the number of Jews working within the Bureau of Labor and Statistics (BLS). Nixon, then at the height of his paranoia, believed that a "Jewish cabal" within the Bureau was undermining him, releasing unfavorable and inaccurate data to the public to damage his approval ratings. Malek, in a memo dated July 27, 1971, reported that 13 of the top 35 BLS officials were indeed Jewish, and provided their names to Nixon. In the months following, Chief Economist Peter Henle and Director of Current Employee Analysis Harold Goldstein were reassigned to lower level positions within the BLS. At the time these events occurred, nothing was known of Nixon's anti-Semitic sentiments. It wasn't until 17 years later that the incident came back to haunt Malek, when *Washington Post* reporters uncovered the fateful memo while digging through old files from the Nixon administration.

After the news broke, Malek resigned as RNC chairman immediately and admitted to compiling the figures for the president, but not for reassigning the two prominent Jews. The damage had been done though. Malek knew that he would be labeled an anti-Semite. He knew the public had no tolerance for that kind of ethnically fueled politicking. He knew that he was in danger and he knew immediately where to go.

Norris called Malek the day the news hit the papers, and told him to calm down, and come over to the Carlyle offices on Pennsylvania Avenue. Malek had his motorcade sneak into the

garage, so as not to be seen by anyone. "I've never seen a man so upset in my life," Norris recalls. "He was literally shaking." Norris set Malek up with an office adjoining his own, and Carlyle gave him a draw, or a salary, which Malek would theoretically have to earn back. Malek was by far the best connected of the nascent company. He brought with him deep relationships with the Bush family, the Saudi Arabian royal family, and countless Washington insiders. Even with his freshly tainted reputation, he would go on to spearhead several big deals for the company, including an ill-fated buyout of Caterair, the Texas-based airline catering company that would hire George W. Bush. Though Malek's stay at Carlyle would amount to nothing more than time on the lam, hiding out while the furor over his anti-Semitic actions died down, he did manage to set Carlyle up with a handful of high-powered Republican connections. He would soon return to public life to lead President George H. W. Bush's reelection campaign in 1991. But after Bush lost to William Jefferson Clinton, Malek found that he was no longer welcome at Carlyle. "No one wanted him back, and it was very embarrassing for Fred not to have a place to land," says Norris. "And it was wrong." Malek still harbors resentment over what he feels was mistreatment. "His wife still hates me," says Norris.

Though brief, Malek's time with Carlyle would ultimately change the face of the company forever. "I brought a little more name recognition, a little more gray hair," recalled Malek in an interview for this book. He is quick to point out that he never joined the firm outright. "I was officing there, just a freelancer," he says. In the fall of 1988, Malek brought Carlyle in on yet another ill-conceived deal to acquire Coldwell Banker Commercial, the biggest commercial real estate broker in the United States at the time. To this day, he asserts his independence from Carlyle on that deal. "It was my deal, my capital, and they just participated in it," says Malek. This exclusive attitude toward Carlyle would eventually cause enough tension between Malek and Rubenstein, that

Carlyle didn't see the need to welcome him back after Bush lost the election. Rubenstein and Conway would often refer to Malek as a "self-centered freeloader." But it was Malek who demonstrated the power of political contacts in deal making, a lesson the boys at Carlyle would take very much to heart.

Ultimately, the Coldwell deal was a bust when the real estate market did not cash in on Japanese investments as was anticipated. About the same time, Malek was helping a well-known Texas native by the name of George W. Bush, the son of then President George Bush Sr., buy the Texas Rangers major league baseball franchise. Like other deals that Malek worked while he was "officing" at Carlyle, the same people who had brought Malek in from the cold found themselves excluded from the negotiations on the Rangers.

There was one deal that Malek would let Carlyle in on, however, that both parties wish had never happened. In a classic LBO, and one of the last major deals of the booming 1980s, Carlyle would facilitate a management-led buyout of Marriott's In-Flite airline catering business. The company would later go on to be nicknamed "Craterair" by Wall Street analysts, and would remain a black mark on Carlyle's record until the mid-1990s. Though the deal would be a major bust, it wasn't all bad. It would introduce the foundering company to a young Texas businessman known simply by his middle initial: W.

2

CRATERAIR

Coffee, tea, or bankruptcy?
—*Forbes,* September 26, 1994

Cast of Characters

J. W. Marriott	Chairman of Marriott Corp., former boss to Stephen Norris, Fred Malek, and Dan Altobello.
Dan Altobello	Former chairman of Caterair.
George W. Bush	President of the United States of America.
Stephen Norris	
Fred Malek	

To understand how Carlyle works today, it is crucial to be fully acquainted with the company's long and sordid history. Each deal the Carlyle Group made, be it a wild success or tragic failure, helped shape what the company has become. Some buyouts that Carlyle participated in helped them gain a better understanding of a new industry. Some introduced them to new people—the human collateral that would open up future opportunities. In engineering the Caterair deal, Fred Malek would accomplish both.

In the case of the Caterair buyout, Carlyle made up for the money they lost—like many of the company's early deals, Caterair was horrendously unsuccessful—by hiring the man that would eventually be the leader of the most powerful country in the world: George W. Bush. Caterair may have been a complete failure

by ordinary business standards, but the relationships cultivated therein were more than worth the stinging financial losses. In Washington, it's not what you know, but who you know, and knowing George W. Bush, then son of the nation's president, was a valuable connection indeed. But getting an in with the president's son wasn't easy, and it all started when the man known simply as "Mr. Marriott" got a hankering to sell one of his businesses.

J. W. Marriott is among the most highly regarded businessmen in the world. He has a proven track record of deft management and strong leadership. His former employees, years after they've left the company, continue to refer to him as "Mr. Marriott," out of sheer respect. He has been known to sense trends in the industry with uncanny prescience. So in 1989, when Mr. Marriott made it known that his company's airline catering division, then known as Marriott In-Flite Services, was on the block, one had to suspect that he knew something the rest of the world didn't know. Nevertheless, a group of zealous Marriott executives went ahead with plans to buy the stagnating division from Marriott Corp. with the help of the newest merchant bank on the block: Carlyle Group.

Originally formed in 1937, Marriott In-Flite had ceased to be a growth area for Marriott by the late 1980s, and Mr. Marriott wanted out. Dan Altobello, who headed the division within Marriott since 1982, decided that he would spearhead a management-led leveraged buyout of In-Flite, meaning the current employees of the division would raise the capital necessary to buy the business from Marriott. Altobello knew exactly who to call to structure the deal. In fact, he knew them quite well.

Norris, Malek, and D'Aniello, were all former Marriott executives and former co-workers of Altobello's, and together they all got to work immediately on putting together a deal. Norris' role was to work the deal such that Marriott's tax liabilities were limited. Malek was needed to help Altobello manage the new independent company (this was a special request of Mr. Marriott).

D'Aniello managed the relationship with Merrill Lynch, which would provide a $250 million bridge loan to complete the deal, the last such deal Merrill Lynch would ever partake in. Negotiations progressed, capital was raised, and then, $650 million later, in July 1989, Marriott In-Flite was sold to its employees and renamed Caterair. Carlyle retained a stake in the new company, as well as collecting a fee for structuring the deal. It would be the last major LBO of the 1980s, the decade of LBOs.

Caterair consisted of 150 different airline customers at 45 U.S. and 38 foreign airports. It had an army of 19,000 employees and revenues of $800 million in 1988. It was a very big deal. Malek and Altobello became co-chairmen and greeted the press with promises of expansion in international markets, particularly the Soviet bloc. But it was not to be.

Malek's Triangle Trade

At the same time he was working to complete the Caterair deal, Fred Malek was also putting together the largest buyout ever in the airline industry: a $3.65 billion buyout of Northwest Airlines, then the country's fourth largest carrier. Malek worked with Al Checchi and Gary Wilson, two more former Marriott executives, to buy out Northwest, and in June 1989, just days before the Caterair deal was finalized, Malek had successfully completed the Northwest deal. That Malek was working on two colossal deals simultaneously was disconcerting to the boys at Carlyle, particularly when they had cut out of the Northwest deal entirely. Just a year removed from his disgraceful exit from public life on the Bush campaign trail, and Malek had multiple irons in the fire. (He was also helping George W. Bush to buy the Texas Rangers at this time.) Controversy had slowed down Malek's political ambitions, but it did nothing to hinder his business pursuits. By October 1989, Malek had been named president and CEO of Northwest. The job

required that Malek assume responsibility for day-to-day operations at Northwest, meaning he could no longer devote the time necessary to Caterair, and the burden of running the company fell solely to Altobello.

But Malek was no fool. Though he was constantly distracted by his myriad responsibilities, he still had time to make some critical moves for Caterair. By 1990, Malek had decided that George W. Bush would make an excellent board member for Caterair. "I began spending all my time on the Northwest deal, and when we did the Caterair deal, I thought he (George W. Bush) would be a good guy to be on that board," Malek told me. "His office had been next to mine on [his father's] campaign, so I knew him real well. He was coming to Washington a lot anyway, and I thought he had a lot of business judgment and practical sense. I just thought he would be a good director." George W. Bush became a board member of Caterair in 1990, the year after the company was bought out. Up to that point, Bush had a decade's worth of experience in the oil industry, but nothing even resembling the service-oriented business of airline catering. But George W. Bush had far more valuable things to offer than direct business experience. His father was president of the United States at the time and one would think that had to be worth something, both to Malek personally and to Carlyle.

In effect what Malek had constructed was his own personal triangle trade. Caterair did a sizeable business with Northwest. Northwest needed some help from the Bush administration on some regulatory issues, after Congress began questioning the airline's near-monopoly status at certain hubs. Finally, George W. Bush needed to bolster his business resume, and Malek of course was close friends with his father. Between currying favor with the president and securing business for Caterair, Malek had killed two birds with one Bush. And that's how cronyism works.

Despite Malek's public statements about Bush being appointed because of his business acumen, one Caterair board member said the real reason that Bush was named to the board was to help

Malek out on with the regulatory issues he was facing at Northwest. The board member also says that Malek, Bush, and Altobello would often huddle together at Caterair board meetings, excluding the rest of the board. Bush's involvement in the day-to-day activities of Caterair was nominal at best. "We all coveted his custom Texas Ranger's boots, signed by Nolan Ryan," says the board member, recalling what George W. Bush added to the board. "He was really smart but not really engaged in Caterair's business." The point at which arrangements like Caterair's break down is when the few individuals who control the company are maneuvering so feverishly for their own personal gain, that the well-being of a company, and its 19,000 employees, is overlooked.

Business went on that way for a time until the airline catering industry hit a wall that Caterair was ill prepared to climb. War in the Gulf, higher oil prices, and a nationwide recession combined to devastate revenues in the airline industry. Airlines started shutting their doors, facing bankruptcy. In 1991, alone, Caterair lost two of its best customers when both Pan Am and Eastern Air Lines stopped flying because of financial insolvency.

Adding to Caterair's woes, airlines started aggressively cutting costs, and one of the first places they looked was their meal budget. By 1993, the nine major airlines had cut food costs by 8 percent. Peanuts and crackers took the place of hot meals. Low-cost airlines that rarely served meals at all, like Southwest, steadily gained popularity. The pullback vanquished profitability in the catering business, which was already operating on razor-thin margins. "They could not cut costs fast enough," Malek bitterly recalls of the airlines.

Norris' Self-Destruction

Caterair lost $185 million in fiscal 1993, down from a profit of $52 million the year before, and the company was in a dire position. At this point, dissension began to fester in the boardroom.

Norris wasn't making any friends at Caterair, riding management and looking for alternatives and exit strategies for the company's quickly evaporating business. He began taking matters into his own hands, looking for buyers and raising money from personal acquaintances. He even held meetings with potential acquirers, like Sodexho, a massive international facilities management company. Norris was pushing his own agenda, and his fellow board members didn't appreciate it. But they all had their own agendas as well. With so much disparate intent in the boardroom, it's no wonder the company failed.

Then Norris went too far. Carlyle had been attempting to negotiate a management fee at Caterair, a customary payment in a leveraged buyout, but something that Carlyle did not ask for until years after the deal had been done. The Caterair board was about to approve the fee, which would at least bring some dividends from the deal back to Carlyle. To do so, the board held a meeting to vote on it. When it came time to vote, the board asked those members of the board who were also on staff at Carlyle to leave the room, due to their obvious conflict of interests. Norris, who had been attending the meeting from Paris via speakerphone, unleashed an inexplicable tirade of obscenities aimed at the board, according to people who were in the room. Apparently indignant at having to hang up during the vote, a perfectly reasonable request, Norris refused. His fiery outburst incensed the other board members, and ended up costing Carlyle the management fee. Reminded of the incident, one Carlyle staffer explained Norris' actions like this: "That's just Steve. One minute he's a brilliant businessman, on the trail of a big deal. The next he's a maniac. Steve is incredibly erratic."

Norris then instructed one of his staffers at Carlyle to work up some numbers on how a sale to Sodexho might save the equity in Caterair. Norris had very little confidence in Altobello's ability to steer the company through these troubled waters. He felt that Altobello had already missed opportunities to exit the

business with their reputations and their bank accounts intact. Norris often criticized Altobello's ineptitude to colleagues and friends. So instead of bringing the paperwork to the company's CEO, he naively brought it to Malek, thinking he could confide in him. It didn't take long for Altobello to find out what was going on behind his back, and he went ballistic, according to Norris. Altobello told Norris he had no right to attempt a sale of "his" company. Norris was asked to leave the board, and it would signal the beginning of the end of his Carlyle career. But it would get even uglier.

Shortly after Norris left, in 1994, George W. Bush would also jump ship. In a move that would dog him throughout his Texas gubernatorial campaign, Bush quit the board in May, in the midst of Caterair's financial unraveling. Incumbent Governor Ann Richards attacked Bush's business record, questioning Bush's claims that he was a successful businessman. "Mr. Bush continues to insist that he's a successful businessman, but when you take a hard look at his record, it's clear that he's not what he says he is," said Chuck McDonald, Governor Richards' spokesperson. With layoffs and losses mounting at Caterair, it was hard to argue. Bush responded feebly in the *Dallas Morning News,* saying simply that "the airline food business is going from hot meals to peanuts, and this company is in the process of adjusting."

The roof was caving in fast now, the result of squabbling in the boardroom and difficult economic circumstances. *Forbes* ran a scathing expose of the company in September 1994, entitled "Coffee, tea, or bankruptcy?" In it, the magazine ridiculed Altobello for drawing more than half a million dollars in annual salary as his company went belly up. Competitors were beating Caterair to international markets, which were the only markets growing at this point. Finally, Caterair was unable to diversify into a number of the ancillary markets its competitors were exploring, because of a noncompete clause with Marriott the managers signed when they led the buyout five years earlier. It was now all too clear why

Mr. Marriott couldn't wait to unload the catering business. It was a lemon.

Adding injury to insult, Representative Harold Ford told newspapers that he nearly choked to death during a Northwest flight in 1992, catered by Caterair. The Democratic congressman from Tennessee claimed there were multiple unidentified objects in his steak and potatoes that tore up his mouth and throat. He filed a lawsuit for $18 million against Caterair. It was horribly embarrassing for the faltering company, and it would coincide with Caterair's last gasp.

In September 1995, Caterair completed a deal with Onex Food Services, the parent company of Sky Chefs, Inc. The value of the transaction was slightly more than $500 million, far less than the $650 million that was originally paid for the company, which had grown its operations in the six years it had been independent, and should have been worth much, much more. It was, by all accounts, a disastrous deal. Carlyle, Malek, and Altobello had all taken a bath on it.

By this time, Malek had been spurned by Carlyle upon his return from the unsuccessful Bush reelection campaign and had gone on to start up his own private equity concern—Thayer Capital. He offers this understated comment on Caterair's ruination: "What went wrong is that you had the Iraqi invasion of Kuwait and the explosion of oil prices, which led to reduced travel and higher oil prices for airlines. There was lower passenger count because people were afraid to travel, and now higher costs because of the huge spike in fuel. We were in a survival mode as the airlines uniformly and drastically cut food service. We had to find a way to come out of that as best we could, and we were able to do that by merging it into Sky Chefs. We got enough cash to pay off debts, and a little bit of equity. It was not a screaming home run."

The saga of Caterair serves as a microcosm of Carlyle's early years. The infighting, egos, petty jealousies, and conflicting

agendas of the Caterair board were the same problems that Carlyle would wrestle with for years. Until Norris left the company in 1995, Carlyle would struggle with achieving solidarity among its upper management and creating a unified identity. Caterair was the first of many examples of the fracturing within Carlyle in the first seven years of its existence. But Caterair wasn't all bad.

Caterair turned out to be a very expensive introduction to then-President Bush's son for Carlyle. From George W. Bush, to James Baker, to George H. W. Bush, the connections made through Caterair would bolster Carlyle's ability to hook high-profile politicians leaving office. In the end, they had Malek, the man to whom they coldly turned their backs, to thank for it.

But it wasn't until 1989, after the Reagan administration had cleared out its desks, that Malek's stamp was permanently impressed on Carlyle. Rubenstein asked Malek who he thought would be a good person to hire coming out of the Reagan White House. Malek thought immediately of Frank Carlucci, the outgoing secretary of defense, and the man who had succeeded him as deputy director of the Office of Management and Budget in 1972. Malek held a cocktail party at his house in Washington, spoke to Carlucci, and quickly sealed the deal. On January 26, Frank Carlucci became vice chairman of the Carlyle Group, and life at the young merchant bank would never be the same again.

3

MR. CLEAN

They used to call him "Spooky Frank Carlucci."
—Former Carlyle employee, July 2002

Cast of Characters

Frank Carlucci	Lifelong public servant, former secretary of defense, former deputy director of the CIA.
Patrice Lumumba	Former president of Zaire, assassinated after only two months in power.
Mobuto Sese Seko	Chosen by Americans to succeed Lumumba, led Zaire into decades of famine and war.
Donald Rumsfeld	Secretary of defense, former college roommate of Frank Carlucci.
Raoul Peck	Filmmaker.
Caspar Weinberger	Former secretary of defense, Carlucci's mentor.
Roderick Hills	Former CEO of Sears World Trade.

The hiring of Frank C. Carlucci brought more than just the instant name recognition of one of the most dedicated public servants of the last three decades. It brought baggage—boatloads of baggage. Over time, the pattern of Carlyle's hiring practices emerges to reveal a series of old friends helping one another out. Norris helps out Malek, who brings in Carlucci, who helps land James Baker III, who places a call to George Bush Sr. Each successive hire helped co-founders Rubenstein and Norris climb the

political ladder, which ultimately delivered Carlyle to its riches. But it was Carlucci that served as the foundation of Carlyle's political reputation. He was the first high-profile, well-publicized hire by Carlyle (Malek was kept quiet for fear of bad press). It was Carlucci that really got the ball rolling, despite his checkered past.

Depending on your political leanings, Carlucci's early curriculum vitae read either like a resume for president of the United States or a checklist of foreign policy snafus. From his days with the U.S. State Department in the explosive Congo to his clean up of the Iran-Contra affair, Carlucci has been everywhere, seen everything, and knows everyone. He has been called "Mr. Clean" for his ability to mop up politically damaging situations, and "Carlucci the Cutter," for his relentless budget trimming. It was this type of ultimate Washington insider that Carlyle was fishing for when they hooked him in the winter of 1989. And that's exactly what they got. Carlucci's tenure at the firm would result in an astonishing litany of high-powered hirings, from James Baker III to John Major to George H. W. Bush, himself. But it was Carlucci's dark political past, and the relationships fostered therein, that suddenly made Carlyle's future so bright.

Born in Scranton, Pennsylvania, in 1930 to the son of an immigrant stonecutter from Southern Italy, the diminutive, soft-spoken Carlucci attended Princeton University, where he roomed, wrestled, and recreated with close friend Donald Rumsfeld. He served two years in the U.S. Navy, took some classes at Harvard Business School, and signed up with the State Department as a Foreign Service officer in 1956. After two years as vice consul and economic officer to Johannesburg, South Africa, Carlucci was assigned to the volatile Congo (now known as Zaire) as second secretary in the U.S. Embassy. He was 30 years old.

The year was 1960, and the Congo was a dangerous place to be. The former Belgian colony received its independence in late June and was holding its first public election. But the mood was still uncertain, and the population was volatile. By July, Patrice

Lumumba and his nationalist party had assumed control of the sprawling country. Lumumba was rumored to be tight with communist factions in the Soviet Union, and the election results put the United States on edge. Even after Congo's new leadership had been established by democratic means, sporadic violence throughout the country was not uncommon.

While negotiating through tribal violence, which had been fomented by the Belgian colonial government for years, Carlucci's daughter was threatened at bayonet-point, and Carlucci himself was stabbed between the shoulder blades and arrested after a car he was riding in struck and killed a bicyclist. But Carlucci, who was once called "a tough little monkey" by his father, stayed on in the Congo, despite the life-threatening circumstances. Lumumba stayed in power only two months, replaced by Mobuto Sese Seko, America's handpicked successor, in the fall. But the threat of a Lumumba-led coup to recapture power remained. Uncomfortable with that prospect, the United States began planning an assassination attempt. A poisons expert was dispatched to the region to carry out the mission. An investigative committee led by Senator Frank Church would later reveal that President Eisenhower himself had ordered the assassination. Though many Americans suspected that their government engaged in this kind of murderous behavior during the Cold War, the Church report made it frighteningly real. And undeniably true.

Lumumba was eventually assassinated, though not by U.S. forces. Instead, rival factions within the Congo took his life during a scheduled prisoner transfer. Many still believe the United States was behind the assassination, sharing information on the time and place of the transfer with the executioners. The Church report ultimately cleared the CIA of involvement. That didn't stop filmmaker Raoul Peck, a native of the Congo who has dedicated his professional life to researching and telling the story of Patrice Lumumba, from including a scene in his docudrama *Lumumba* that shows a group of men plotting Lumumba's murder.

At one point during a vote on the means of assassination, an actor playing Carlucci is asked what he thinks. His response, intended to appear disingenuous, is, "My country's government is not in the habit of meddling in the democratic affairs of a sovereign nation. We'll respect your decision." Peck says his extensive research uncovered that Carlucci was involved in the plot at the highest level, and the scene was used to illustrate that point.

Carlucci would fight the filmmaker, and eventually have the scene edited (his name is bleeped out), saying it was a simple case of mistaken identity. "I was never as fat as that guy," he charmingly told reporters at the film's opening. "The scene is tendentious, false, libelous; it never happened, and it is a cheap shot." Peck says today that the film's distributor did not want to run the risk of a lawsuit, but Peck stands by the veracity of the film, and in particular, that scene.

Cold War Operative to Career Politician

Thus, began Frank Carlucci's rise through the ranks of the executive branch. Before being offered the number two job at the Office of Economic Opportunity (OEO) in 1969 under his old friend Donald Rumsfeld, he was accused of leading the overthrow of Joao Goulart in Brazil in 1964, Abeid Karume of Zanzibar in 1972, and Salvador Allende of Chile in 1973, according to the London *Times*. He was also accused by Italian communists of being behind the 1978 kidnapping of Aldo Moro, and subverting the revolutionary process in Portugal. "He has been a specialist in dirty work and coup attempts in the Third World," Ramon Meneses, spokesman for the Sandinista Front in Nicaragua would tell reporters later. Carlucci denied everything, and nothing was ever proven. But Carlucci had already earned a couple more nicknames—"Spooky Frank Carlucci," and "Creepy Carlucci"—and his reputation as a Cold War operative in charge of installing

pro-Western governments throughout the world would follow him throughout his career.

Carlucci went on to succeed Rumsfeld at the OEO, then followed it up with stints at the Office of Management and Budget (OMB) (where he was succeeded by Fred Malek), Department of Health, Education, and Welfare (HEW), and finally landed as the deputy director of the CIA in 1978, under Carter's administration. During his time at the CIA, Carlucci was accused by conservative senators of weakening the agency through budget cuts, a charge that worked against him when those same senators voted against his nomination as deputy secretary of defense under Reagan (though he was ultimately approved for the job). He also pushed for legislation that limits the public's right to learn of CIA activity through Freedom of Information Act (FOIA) requests, an important tool for Americans wanting to know more about the actions of their elected officials.

By February 1981, working under Caspar Weinberger in the defense department, Carlucci was cultivating a new reputation, that of a master bureaucrat, efficient manager, and loyal citizen. He was seen as a problem fixer, dispatched to hot spots around the world to ensure a positive outcome for the United States. He had a history of attracting, then defusing, controversy. His legacy in tact, his connections extensive, Carlucci left the public life in 1982 for his first real business endeavor: world trade.

Secret Arms Deals

In what would later become a model for the Carlyle Group, Carlucci signed on to work with the newly formed Sears World Trade, a subsidiary of Sears designed to post executives around the world and compete with Japanese *sogo shosha* (trading companies). These massive companies leveraged size and extensive resources to conduct international trade, like timber in Thailand

for paper in Paraguay, always buying low and selling high. Like the Carlyle Group five years later, Sears World Trade (SWT) curiously chose to base itself in Washington, DC, and hire exgovernment officials as its top executives.

Sears World Trade CEO Roderick Hills had been SEC chairman from 1975 to 1977, and knew Frank Carlucci from his time as counsel to President Gerald Ford, when Carlucci was working with Caspar Weinberger in HEW. Hills brought Carlucci on as president of Sears World Trade. Among the other former government officials that wound up at SWT were Curtis Hessler, former assistant secretary of the treasury, and Alan Woods, former deputy secretary of defense. The group had grand dreams of an international trading powerhouse. The end result was far from it.

The company hired more than 1,000 employees, which made it several times larger than comparable companies. And it lost money. A lot of money, very fast. Sears World Trade, lost $12 million in its first year. It lost $16.3 million in its second year. It racked up monstrous travel expenses en route to making precious few trades. The strategy was ill-defined, and by 1984, Hills would resign abruptly amid growing losses.

It was about this time when the press began speculating that company was a CIA cover up. It wasn't an illogical conclusion to draw. There was a conspicuous lack of deals. The numerous staff, many with political ties, in far-flung locations puzzled business analysts. The Washington, DC, address was very unusual. There was no income. And of course, Frank Carlucci was right in the middle of it all. Everything seemed to add up. But Hills dismissed the claims, telling the *Washington Post,* "People like to make fun of the fact that we hired high government officials," explains Hills. "We didn't do that."

Then in 1986, the press learned of covert arms deals that Sears World Trade had participated in over the previous three years. The news hit just as Carlucci, by then chairman of SWT,

was chosen by President Reagan to head up the National Security Council, called in to replace John Poindexter, who resigned amid the furor over the Iran-Contra affair. The irony was thick. A new national security advisor, another arms scandal.

Using a subsidiary of SWT, called the International Planning and Analysis Center, Carlucci consulted on the buying and selling of anti-aircraft missiles, radar, jets, and other military equipment for the United States and Canada. IPAC was loaded with exmilitary, and also provided consulting to Third World countries. But nobody within SWT even knew about it. Donald Rumsfeld, never to be found too far from Frank Carlucci, was a member of the SWT board, and was quoted as saying, "We received periodic reports on Sears World Trade as an entire company, but I don't personally remember the arms deals." Another board member reacted with astonishment when he heard the news. "You're kidding," he candidly exclaimed. It appeared to be at least a breach of the public's trust, not to mention shareholders. For a brief time, the news looked like it would be a devastating blow to Carlucci's future ambitions in politics. At a time when he was being called up to restore credibility to the National Security Council, he was being dogged by accusations of yet another controversial covert action. But like so many times before, and in what would come to be his trademark, the Teflon-coated Carlucci miraculously sidestepped the controversy, and the story died quietly. Carlucci, a master at handling the press, quickly scuttled the potentially damaging story by pointing out that IPAC never did any consulting on "lethal weapons." That was enough to pacify the press, and just like that, Carlucci was back in public office.

Carlucci did not walk away from his time in corporate America empty handed. In fact, he made a small fortune, despite the dismal performance of Sears World Trade. In the disclosure papers he filed upon reassuming government work, he claimed his total income in 1986 was $1.2 million, which included more than

$700,000 as a termination settlement from Sears World Trade. Not bad for steering a company into bankruptcy.

A Farewell to Arms?

In the National Security Council, Carlucci was finally back in his element. He made fast friends with Congress and quickly cleaned house as Reagan's National Security Advisor. He jettisoned the dead weight. He called Senators. He kept an open office. And he hired a young Army Lt. General by the name of Colin Powell as his new deputy. In short, he was a natural. "Frank has a tremendous advantage in that he is one of the few people in Washington who gets on very, very well with both Cap [Weinberger] and Secretary Schultz," said Kenneth Adelman, director of the Arms Control and Disarmament Agency at the time. In fact, Carlucci was well liked by just about everyone, which in DC politics can be as much a liability as it is an advantage. Carlucci is a man known to get things done without screaming and yelling. Norris says of Carlucci, "Frank doesn't like confrontation; he likes people to agree with him."

In November 1987, Carlucci would succeed Caspar Weinberger as secretary of defense for the final year and a half of the Reagan administration. He would spend much of his time refining the budgeting and weapons procurement process, experience that would serve him well in his future role with Carlyle. While in office, he would set up an advance procurement system that favored long-term contracts with various purveyors of military goods. When Carlucci left the office of secretary of defense to join Carlyle, he would have special knowledge of which defense contractors would later be cashing in on the long-term procurement system he had arranged. And he would take advantage of that knowledge.

The relationships he established while in office would prove invaluable. In 14 months as secretary of defense, Carlucci would travel overseas 13 times, to Europe, the Middle East, Asia, and Africa. He was charming and diplomatic, and he gained supporters throughout the world. Everybody loved Frank.

In another of the stunning ironies of Carlucci's career, he fought hard to decrease spending and eliminate unnecessary weapons programs, angering military contractors and the armed forces in the process. Just 10 years later, he would find himself caught up in the same situation, only this time he would be siding with the contractors, fighting to keep outdated weapons programs alive in his role as chairman of Carlyle Group.

Despite his controversy-ridden past, Carlucci was thriving both in and out of the public domain. "Frank was washed clean by Cap Weinberger by selecting him, Ronald Reagan by nominating him, and the Senate by confirming him," says Norris. By the time Carlucci took his place at the Carlyle Group, he would have accumulated a history of covert operations, controversial assignments, disastrous business dealings, and a string of connections so powerful that, despite his dismal track record in business, any company would bend over backwards to get him. As it turned out, that company was the Carlyle Group.

4

CARLUCCI'S CONNECTIONS

Being connected to Carlyle sure doesn't hurt.
—Phil Odeen, chairman of TRW, August 21, 2002

Cast of Characters

Earle Williams	Former CEO of BDM, a highly successful defense consultancy.
Melvyn Paisley	Former Naval officer in charge of awarding Navy contracts.
Vicki Paisley	Melvyn's wife and employee at BDM.
Phil Odeen	Williams' successor at BDM, currently chairman of TRW.
Frank Carlucci	

When a Pentagon official leaves office, there are federal restrictions that prohibit that person from working for a defense contractor for at least one year. It is known as a "cooling-off period." Designed to put enough time between active public servants and their subsequent private lives, the cooling-off period is widely regarded in Washington as a joke. It is nominal and rather ineffective. The reason it exists, however, is because of the extraordinary temptations that former Pentagon officials face both while they are in office, and the moment they leave, from the many defense contractors eager to get new business. Braddock, Dunn, McDonald (BDM) was one of those contractors. The company's

history, both as a part of Carlyle's portfolio and outside of it, clearly demonstrates the secretive and sometimes surreptitious world of defense contracting—the world in which Carlyle has chosen to do business.

In addition, Pentagon officials, like all public officials, are often in a position to capitalize on policy decisions they made while in office. Carlyle's acquisition of BDM, as with many of their other deals, reflects more on Carlucci's knowledge of the system he helped create and his network of friends than the company's ability to identify a good deal. They are connections he made while acting as secretary of defense, as well as his many other government roles. They are very valuable connections. And it was Carlucci's connections that got Carlyle off its losing streak after a series of disastrous deals, when BDM turned into a bonanza.

Carlucci had accepted his position with Carlyle almost immediately after leaving office, but had only worked peripherally on defense deals. By September 1990, just 18 months after Frank Carlucci had resigned his post as defense secretary, the man who had reengineered defense spending and procurement at the Pentagon was ready to bring his expertise to bear on the industry he had shaped. Though he had already been wheeling and dealing on behalf of Carlyle with regard to other defense properties, he was now legally able to accept an official position with a defense contractor, an important distinction that would attract defense companies to Carlyle. With Carlucci "cooled off," Carlyle's defense prospects were really heating up.

Defense spending was still anemic after the end of the Cold War and before the beginning of the Gulf War, and Ford Motor Company was looking to divest its defense holdings, namely Ford Aerospace. Carlyle fought hard to buy the entire unit, but it lacked the capital, a shortcoming that would often plague the company in the early going. In the end, the fledgling company lost Ford Aerospace to Loral, a much more established player in

defense. Loral bought Ford Aerospace for $715 million in cash. But thanks to Frank, Carlyle wasn't entirely cut out of the deal.

Carlucci's contacts would prove valuable early and often in his career at Carlyle. In particular, his close friendship with Earle Williams, president and chief executive of BDM International, a defense consulting subsidiary of Ford Aerospace, would deliver Carlyle with the firm's most lucrative defense buy out of the early 1990s.

BDM is one of the most successful defense consulting businesses in the history of the industry. When it was founded in 1959 in El Paso, Texas, the company was focused on doing weapons systems analysis, a geeky trade they plied mostly at offices in New Mexico. In 1962, they hired Earle Williams, a young engineer from Alabama, who over the next three decades, that included his promotion to CEO in 1972, came to embody the new spirit of the company, a hard-driving consultancy intent on expanding its business to all parts of the armed forces. In 1973, Williams and BDM put the harsh summers of Texas behind and moved to McLean, Virginia, just outside of Washington, DC, in order to be closer to the federal government with which it was now doing most of its business. He was moving them to where the money was.

It didn't take long for the company to learn the harsh lessons of doing business in Washington, when competitors stole contract after contract from under them because of tight political connections and well-timed campaign donations. It was a lesson that Williams learned the hard way, but one he would never forget.

Over the next two decades, the outspoken Williams would thoroughly insinuate himself into the DC power scene. Suddenly, Williams was everywhere on Capitol Hill, holding fund-raisers, heading civic activities, rubbing elbows with key politicians, and landing on highly coveted advisory boards. Among the close ties that Williams forged during this time was a friendship with Marcia Carlucci, the wife of Frank Carlucci. Williams' ability to work

the room was a style of doing business that Carlyle would learn much from. And, as it turned out, it was highly lucrative. "I didn't think there was anything unusual with what I was doing at the time," says Williams, who retains his Alabama drawl and speaks with the ease of a man who has long since fought his most meaningful battles. "I just figured if you want to know people, you go where they are. It doesn't take a rocket scientist to figure that out."

Williams got to know Frank through Marcia Carlucci, and also through his work with the Defense Department (DOD) when Carlucci was secretary of defense. "When [Carlucci] was in the DOD, we had a V.P. that was working in the DOD that was on leave from us . . . sort of," says Williams.

Williams' relentless gripping-and-grinning eventually paid off. In 1984, Williams was appointed to the Naval Research Advisory Board, which consulted the Navy on long-term strategic planning. BDM's competitors couldn't believe it. How did this man manage to convince the secretary of the Navy to place him on an advisory board that allowed access to confidential information and Navy officials? Particularly when the bulk of BDM's business was with the Army and Air Force, not the Navy? (In 1983, BDM did just $1.9 million worth of business with the Navy, an insignificant fraction of their overall business and an unregistered blip on the Navy's massive procurement budget.) The answers would soon be forthcoming and would demonstrate just how much Williams had learned about doing business in the Beltway.

In the spring of 1983, BDM hired a little-known market researcher by the name of Vicki Paisley for a yearly salary of $40,000. It turned out to be an excellent hire. Paisley's husband, Melvyn Paisley, was in charge of awarding Navy contracts. A year after the hiring of Vicki Paisley, Williams landed the coveted position on the Navy's advisory board. "Mel was instrumental in getting me on that board," recalls Williams, who says that Paisley approached him for the position, and Williams initially demurred. "I think

you've got the wrong man, we work mostly with the Air Force and the Army," Williams told Paisley. But Paisley wouldn't relent, and eventually succeeded in signing up Williams. It was a coup for Williams, and it paid off almost immediately. Between his appointment to the Naval Research Advisory Board in 1984 and the end of fiscal 1987, BDM had more than doubled its contracts with the Navy from $3.1 million to $6.6 million. Then, in the beginning of fiscal 1988, BDM was reporting to shareholders an expected $62 million in Navy contracts, according to a *Washington Post* article. The build up in Navy contracts had other defense contractors from around the world scratching their heads. Competitors accused Williams of hiring Vicki Paisley as a favor to Melvyn, who then brought in Williams to the advisory board, and subsequently awarded Navy contracts to BDM. The situation reeked of perceived impropriety, and the newspapers covered the entire story in great detail, but inexplicably no investigation was called for at the time.

Much of the new business BDM was garnering was in an area the Navy called *Black Projects,* or budgets that are kept secret because to publicize them would compromise national security. Lawmakers often complain about Black Projects, citing that many contracts are thusly classified, not because of national security concerns, but rather to avoid the required congressional review. Regardless, BDM was suddenly ratcheting up its Navy business year after year. When Melvyn Paisley left the Pentagon in 1987, he took a job alongside his wife, consulting for BDM. It was a good time to get in. The company was clearly growing fast, and in the midst of its good fortune, was bought in May 1988 by Ford Aerospace for an eye-popping $425 million. Times were good, and Earle Williams had finally showed the cutthroat defense contractors how business was done in the Beltway.

Then in the summer of 1988, Operation Ill Wind swept through the Pentagon, exposing a ring of corruption, bribery, and fraud that would eventually send dozens of officials to jail

for rigging the awarding of defense contracts. For years, various elements in the government had suspected widespread corruption in the Pentagon and the defense business. Several years of covert investigation proved those suspicions true. It was a crushing blow to the credibility of the Pentagon and the secretary of defense at the time, Frank Carlucci. Arrests, arraignments, and convictions rained down weekly on the Pentagon, armed forces officials, and the defense contractors with whom they all did business.

The most prominent official convicted in the seven-year investigation was none other than Melvyn Paisley, who pleaded guilty to conspiracy to defraud the government, bribery, and theft of government property. He was sentenced to four years in prison for taking kickbacks. The FBI investigated BDM and the connection between Williams, Paisley, and his wife. Documents from the Paisley home were confiscated, including at least a dozen relating to BDM. Williams was told that he would eventually need to testify in front of the grand jury, but the bureau was unable to bring a case against BDM, and, as Williams says, "Ill Wind just blew away."

Williams had this to say about his role in the investigation: "In hindsight, I understand why people would have thought we participated [in illegal activity]. When Vicki Paisley came to see me, I didn't know who she was, but she wanted the job. I was aware of a potential conflict, and I told her that it probably wouldn't be suitable. But she said she really wanted to work for me. I asked her why she was leaving her job at Computer Sciences Corp. (CSC). She said it was because Mel told her to because CSC was doing too much Navy business, and it looked bad. I guess that's ironic. When Ill Wind hit, we started to lose business, but I told our clients we hadn't done anything wrong. There was never any real involvement of BDM in Ill Wind, and I guess the FBI just eventually figured we were small potatoes."

But the damage had been done. Between the residue left from the scandal and the end of the Cold War, the value of BDM, now

a subsidiary of Ford Aerospace, plummeted. When Loral picked up Ford Aerospace in the fall of 1990, Williams was intent on not working for Bernie Schwartz, then the head of Loral, for personal reasons. Ironically, Williams convinced Schwartz that owning BDM would be a conflict of interest for Loral, since BDM had consulted the Pentagon on systems that Loral produced. The perceived conflict of interest inherent in hiring Vicki Paisley seven years prior hadn't weighed on Williams' conscience quite as much, apparently.

After Williams got in touch with his good friend Frank Carlucci, Conway negotiated the purchase, and $130 million later, BDM was the newest company in Carlyle's portfolio. That was less than a third of the $425 million Ford Aerospace had paid for the company just two years prior. Carlucci landed a job as chairman, Conway snagged a seat on the board, and Williams stayed on as president and CEO. It was a steal.

A New Friend

After a couple of years, Williams, age 62, aspired toward a career in government service and, in early 1992, announced his retirement from the $400,000-a-year CEO job at BDM. It was time for another friend of Frank. This time, Carlucci turned to an old buddy and tennis partner by the name of Phil Odeen, currently chairman of TRW. A vice chairman at Coopers Lybrand at the time, Odeen had known Carlucci for decades, having spent 13 years in the office of the secretary of defense early in his own career. Carlucci's wife had even worked with Odeen at Coopers. Odeen was also good friends with Williams, and so the circle was complete. Over a tennis match in the winter of 1992, Carlucci popped the question.

"He asked me if I had any interest in the job, and I had just been promoted to vice chairman at Coopers and moved to New

York," Odeen told me. "I said no thanks, but if you don't find the right person, give me a call." Carlucci called the very next morning and arranged a Sunday morning breakfast meeting in DC between Conway, Rubenstein, and Carlucci. Apparently, Carlucci had indeed found the right person, and it was Odeen. Within a week, Odeen had an offer, and by May, Odeen was the new president and CEO of BDM. "It all happened very fast," recalls Odeen.

Under Odeen's watch, BDM would transform itself from a business heavily reliant on defense contracting to a more diversified services company. "The Cold War was over, and defense budgets were coming down," explains Odeen. "Information and communications technology were more important than ships and tanks." Odeen did a bang-up job getting BDM into emerging enterprise resource planning (ERP) and warehouse automation markets. But it was still defense that buttered BDM's bread. And controversy in that arena was set to strike yet again.

On Christmas Eve, 1994, the *New York Times* reported that Frank Carlucci had again been involved in a clandestine arms deal, this time with the Soviets. With Carlucci as chairman, BDM, now a Carlyle portfolio company, had brokered a deal between the Pentagon and the former Soviet Republic of Belarus to secretly purchase an S-300, the Soviet's version of the Patriot missile defense system the United States had used so effectively during the Gulf War.

After the Cold War, the Russians were selling weapons to both allies and enemies of the United States. They needed the cash and no longer had much use for weapons, so the Russians opened up an arms bazaar. In another black budget project, BDM was hired in 1992 to acquire the S-300 for the Defense Intelligence Agency's Missile and Space Intelligence Center in Alabama. American forces wanted the weapons so they could take them apart, see how they work, and develop ways to defeat them.

For the deal, BDM used the infamous Canadian arms dealer Emmanuel Weigensberg, the same man that brokered the Iran-Contra arms shipments for the Reagan White House. The reason for the secrecy around the deal, says Odeen, was that the Russians were selling the same weapons to America's enemies and wouldn't want those customers to know the Russians were playing both sides of the fence. But others speculated that the Russians had been duped. That they never knew they were selling the S-300 to the Americans, and had they known, would never have gone through with the transaction. Hence, the need for a middleman like Weigensberg, to obfuscate the actual buyers. Odeen denies those accusations. "We did not do these deals openly or publicly, but they [the Russians] knew who they were selling to," says Odeen. "This was a decent business for us. We had the relationships, and we were essentially a broker."

But BDM's competitors didn't see it that way. Again, there were charges of favoritism, cronyism, and quid pro quo. Russian military officials were reportedly incensed by the transaction, claiming they had no knowledge of the ultimate buyer. Competitors griped about their inability to penetrate the relationship between BDM and the Pentagon.

They said that BDM's connections, particularly within Carlyle, were to blame. At the time, Pentagon spokesperson Kenneth Bacon told the *Times* that he was "concerned about any allegations of unfairness and will review them as appropriate." But BDM was cleared again. The company seemed to have acquired Carlucci's Houdini-esque ability to sidestep scandal.

As it turned out, BDM had in place something called a "basic ordering agreement," or an ongoing, open-ended, long-term contract with the Pentagon. The agreement did put BDM on an inside track with regards to foreign weapons procurement. "Otherwise, it can get very bureaucratic," says Odeen. As for Carlucci's potential involvement, having advocated long-term

contracts that protect vendors like BDM when he was secretary of defense, Odeen recites an exculpatory mantra heard over and over again throughout Carlyle's history. "I don't think Frank had anything to do with that at all," says Odeen. He adds, "But being connected to Carlyle sure doesn't hurt."

Indeed, BDM's connections to Carlyle have done nothing but help them. And the deal didn't work out too badly for Carlyle, either. First, Carlyle took the company public in 1994. Then in 1997, TRW paid $975 million for BDM, making Carlyle's $130 million investment just seven years earlier, look brilliant. Phil Odeen went on to become the chairman at TRW, which then became one of the largest defense contractors in the country. In the words of Fred Malek, *this* deal was a "screaming home run."

Carlyle also used BDM in doing due diligence on future defense deals. It was a perfect setup. Because BDM had so much consulting experience and had worked with most of the major contractors, Carlyle had built in proprietary knowledge of dozens of defense companies. And this is where the bulk of Carlyle's early deals would come from. Some were more successful than others, but with defense, Carlyle had found a calling. They had found a business that they understood, in which they had myriad connections, and could make loads of cash. They had found what would become their identity.

But with the acquisition of BDM, Carlyle was agreeing to do business in the shadowy world of defense contracting; a murky business with which Carlucci was well acquainted, but Norris and Rubenstein knew little about. The decision to go down this road would eventually make Carlyle one of the largest defense contractors in the country and would create the controversial behemoth it is today.

5

GETTING DEFENSIVE

It's like shooting fish in a barrel.

—Former Chrysler chairman Lee Iacocca,
Washington Post, March 31, 1985

Cast of Characters

M. W. Gambill	Former CEO of defense contractor Harsco.
Norman Augustine	Former CEO of defense contractor Martin Marietta.
William Conway	
Frank Carlucci	

Legendary former chairman of Chrysler, Lee Iacocca, had a habit of asking his contractors, many of whom also sold goods to the military, whether making money in defense was a sure thing. "They start chuckling, and they look around to see if the office is bugged," said Iacocca in an interview in the mid-1980s. "And they say, 'It's like shooting fish in a barrel.'"

No one knew this better than Frank Carlucci, who fresh off his 18-month stint as secretary of defense, was getting his feet wet in the world of high finance for the first time since his unsuccessful run with Sears World Trade. But this would be different than his earlier disasters. Carlucci was going to deal in the industry he knew best: defense. After the BDM deal was completed, the rest of the defense world knew Carlucci meant business.

In the years following the BDM acquisition, Carlyle would embark on a stunning series of defense dealings, fighting it out with the giants of defense contracting, and quite often having their hats handed to them. But many of the deals they did win were hugely successful, as well as controversial, and built them into the nation's eleventh largest defense contractor. The disconcerting pattern of doing business with questionable companies continued, however, and signaled Carlyle's willingness to dwell in the dark underworld of the defense industry. With BDM's consulting help, Carlyle made a run at the top defense players in the nation and, when it was all said and done, carved themselves a place at the top.

An Arsenal of Democracy

The government has a long history of overpaying for weapons, offering interest-free loans, waiving federal taxes, bailing out floundering defense contractors, and even paying generous termination fees to unsuccessful vendors. The Defense Department has bailed out more than 6,000 defense companies since 1958, under an act of Congress known as the Extraordinary Contractual Relief Act. It is all done in the interests of "national security." And it amounts to a government-subsidized industry, doing business over a safety net.

Carlucci had as much to do with the current state of defense spending as anybody. As deputy defense secretary under Weinberger, Carlucci developed a Pentagon policy of procurement that called for higher profits for the defense industry. It also lowered the risks within defense contracting, ensuring long-term and no-bid contracts, both moves intended to encourage private companies to enter the market. Privatization, the practice of taking government-run offices and departments and forming for-profit, private companies, was all the rage. The idea was to build

up a healthy and happy private defense industry that would carry the United States to victory in the Cold War. And juice the economy while we were at it.

It worked. The defense industry blossomed under Reagan's watch by creating, and the former president himself termed it, an "arsenal of Democracy." At one point in 1985, a *Washington Post* expose on the defense industry uncovered that the Pentagon was spending an average of $28 million an hour—24 hours a day, 7 days a week. The top 13 contractors had revenues of more than $122 billion. Those same contractors were also the ones consulting the government on which weapons to buy and when. And few of the defense contractors were paying taxes. The numbers were astounding. It was a great time to be in the defense business. But it wouldn't last.

Just nine months after Carlucci took his post at Carlyle, the defense business came to a screeching halt, marked by the felling of the Berlin Wall on November 10, 1989, and the subsequent end of the Cold War. The defense industry went into instant retreat. Secretary of Defense Richard Cheney announced a "peacetime dividend" and quickly slashed $180 billion off the defense budget. Because of the end of the Cold War, everyone knew that the budget cuts were imminent, but no one thought it would be so quick, and so severe. Values of defense companies plummeted. Contractors didn't know what had hit them. It was a perfect time to get into defense buyouts, when all the properties were cheap, and Carlucci knew it.

After the BDM buyout, Carlyle began bearing down on the defense market in earnest. The first object of its affection was a Pennsylvania-based industrial company that owned an undervalued defense division that made howitzers and other military equipment, Harsco Corp. The defense division that Harsco harbored would later become the now well-known United Defense (much more on that later). The only problem was, Harsco wasn't interested in selling. Harsco employees didn't want to sell the

company at such a low point, locking in their losses. As a result, they resisted Carlyle's overtures, which often happens in the fierce world of leveraged buyouts, as companies struggle to maintain their independence during hard times, while the vultures circle above.

Carlyle went to plan B. If they couldn't convince Harsco management to sell the company outright, they would start snatching up public shares. It was more time-consuming and generally more expensive to acquire a company this way, but the thinking is that by gaining a large position in stock, they could begin to exert some pressure on Harsco's management. So Carlyle began accumulating a large stock position in Harsco, about 6 percent of the total shares outstanding. If they didn't want to sell, Carlyle was going to put the screws to them, threatening to acquire a majority share in the company. Then, at 2:30 P.M. on Ground Hog Day 1990, Harsco CEO M. W. Gambill got the call from Frank Carlucci.

It is known as a courtesy call, making a CEO aware of an aggressor's increasing position in a public company, as if Gambill hadn't already noticed. Carlucci and the boys at Carlyle had their eye on Harsco's defense division, whose value had been decimated by the retreat in defense spending. But Harsco still wasn't interested. Carlyle quickly increased its position in the company, until it became the majority shareholder with nearly 7 percent of the company. It submitted a restructuring plan to the company that included a tempting $15-a-share dividend, an appeal to shareholders of the company, a move designed to outflank Harsco's management. Harsco still wouldn't budge, and the company rejected the proposal outright. It was a slap in the face to Carlyle, and symbolic of the company's early lack of clout. Carlucci's reputation alone was not enough to get potential buyout targets excited. The company had no track record, and Harsco could not be sure of its intentions. Would Carlyle just break the company up and sell it for parts? Or would they nurture it back to health, then sell it for a profit? There was no precedent by which

Harsco could judge Carlyle. And they would just as soon not do business with them.

Carlyle was not through, however. The company upped its stock position to 10 percent, and demanded two positions on Harsco's board, as negotiations became more contentious. Harsco, under significant pressure now, compromised, offering Carlyle one position on its board. But Harsco never sold the unit to Carlyle outright. Harsco had maintained its independence and fended off a hostile takeover. It cost Carlyle $63 million in stock to gain that one board seat, not to mention the time and labor costs of doing due diligence on Harsco. On the surface, it was a terrible deal. But six years later, when Carlyle used that board seat to steal United Defense away from General Dynamics, it would prove to be one of the best deals the company ever made.

More Ill Wind

Shortly after this failure, Carlyle turned its attention to another highly controversial acquisition target: Unisys Corp. Now known mostly for its mainframe computer and IT services business, Unisys was among many companies looking to divest itself of a money-losing defense division. But in June 1988, in the middle of Carlucci's tenure as defense secretary, Operation Ill Wind, the same investigation that had attempted to nail BDM, took down Unisys. The probe, led by Assistant U.S. Attorney Joseph Aronica, resulted in convictions against 45 individuals and $225 million in fines. It was a comprehensive web of corporate and political corruption in the military, exactly what Eisenhower had warned against 30 years earlier. And it was all uncovered during Carlucci's watch.

In September 1991, after the probe was complete, Unisys alone paid $190 million in fines for bribing public officials en route to hundreds of millions of dollars in contracts. The company pleaded

guilty to conspiracy, bribery, and illegally overbilling the government. Unisys had been disgraced and, as a result, was thoroughly devalued. Of all the companies implicated in Operation Ill Wind, Unisys probably took the worst hit. And now, Carlyle was looking to pick the defense division up on the cheap.

Ultimately though, much like with Harsco, Carlyle would fail. Unisys and Carlyle would flirt for the better part of a year before Unisys chose to take the division public instead. Carlyle was having trouble convincing potential buyout partners to get in bed with them, an obstacle that is not uncommon for young buyout firms. Each failed takeover attempt costs money, though. And the payoffs were not forthcoming. It was another devastating setback for the incipient company, but it would not prove fatal. Not even close.

The folks at Carlyle were learning on the job. They had taken a few lumps, but in the company's 1992 bidding war for the defense and aerospace division of LTV Corp., they would show off their newly acquired erudition. The saga of LTV would ultimately consume a full year, involve multiple court battles, and even require a presidential intervention before it was done. Rubenstein would call it the most difficult transaction he had ever been involved in. It was, in a word, wild.

The fun once again started with a call from Frank Carlucci, this time to his friend Norman Augustine, chairman of defense giant Martin Marietta and former assistant secretary of the Army. Together with Lockheed Corp., Martin Marietta had announced on February 3, 1992, the purchase of LTV's defense and aerospace division, which was in bankruptcy at the time, for $355 million. It was a steal and, for all intents and purposes, a done deal. But on March 27 of that year, Augustine took a call from Carlucci, who asked if Lockheed and Martin Marietta might be willing to cut Carlyle into the deal.

Augustine was shocked and confused. For the past few months, Carlyle had been putting together a competitive bid for the division, with its partner Thomson-CSF, the French defense contractor.

Why would Carlucci be asking in on his deal? Especially now, when it was practically done?

As it turned out, things weren't going so well between Carlyle and Thomson. Carlyle once again couldn't get the financing in order for its share of the deal, and Thomson wouldn't proceed without it. The fragile partnership the two had constructed was falling apart. Thomson chairman Alain Gomez was calling around, looking for other partners that had the capital, and could complete the deal. All of which led Carlucci to call his old friend Augustine.

Bill's Will

Conway and Rubenstein met with Augustine and offered $50 million to get in, money they said would be useful if Thomson were to succeed in finding another partner and make a new more competitive bid at the eleventh hour. Augustine turned them down flatly, apparently unconvinced that Thomson would ever reemerge as a real threat. It looked like it was over. Thomson officials had abandoned hope, and Augustine felt certain that LTV was his. But Bill Conway had other ideas.

A relentless businessman, Conway was largely responsible for building MCI Communications into a major player in the telecommunications industry as chief financial officer during the 1980s. He had an impeccable reputation in financial circles, often cited as one of the top handful of CFOs in the country. He was a fearsome manager in the Carlyle offices, building tight-knit groups of his favorite employees and largely ignoring the rest of the company. One former employee said, "You're either in with Bill or your out, and if you're out, he'll make your life miserable."

Conway is a conservative businessman from New England and a real company man. Many ex-employees credit him with cultivating an atmosphere of intimidation in the Carlyle offices, putting

employees in place by firing off companywide e-mails stating, "I'm sick and tired of people complaining about *their* offices and *their* office furniture. It's not *your* office or *your* furniture. It's *mine*." He was notoriously cheap and would often gripe loudly about there being too many employees at Carlyle, "sitting around *my* offices, drinking strawberry flavored water."

The way Carlyle was structured, the partners got very, very rich from big deals, and no one else saw a dime outside of their salary. Conway would inexplicably remind employees of this sore spot when he would close out a company meeting by proclaiming it was time to go out "and make me money." According to those who worked for him, he could be alternately brilliant, driven, and despotic. And he never gave up on a deal.

Two days before the bankruptcy judge was to award LTV's assets to Martin Marietta and Lockheed, Conway got the needed money together from Carlyle's old benefactor, the Mellon family, and called Thomson to make nice. With the money in hand, Thomson and Carlyle quickly resolved their differences, waltzed into bankruptcy court, and offered $400 million in cash for LTV aerospace, $45 million more than the Martin Marietta/Lockheed team had offered. Conway had pulled it off, against all odds. Augustine was floored, and defeated. Or so it seemed.

This war was just heating up. Augustine kicked it into overdrive, setting up meetings with Assistant Secretary of Defense Paul Wolfowitz, Deputy Secretary of Defense Don Atwood, and Assistant Secretary of the Army Stephen Conver. Augustine argued that selling LTV's defense and aerospace division to Thomson, a company partly owned by the French government, would be a breach of national security. Martin Marietta sent a raft of lobbyist to the Hill to persuade lawmakers to come out against the deal. And quickly the tide turned. Augustine was making progress in blocking the sale. Carlucci worked the phones, as well, getting assurances from several Pentagon officials that the

deal would go through, despite the concerns of lawmakers over foreign ownership.

In the final day of bankruptcy court, the bidding escalated rapidly. Augustine had created enough uncertainty over whether the U.S. regulatory agencies would approve the deal, that the game was once again wide open. Because LTV's creditors were concerned over regulatory approval of the deal, which wouldn't be known until months after the actual sale, Carlyle and Thomson were forced to increase their bid to $430 million, plus a $17 million nonrefundable deposit. In the event that the sale was denied by lawmakers under national security concerns, Carlyle would pay LTV $17 million for nothing. Martin Marietta and Lockheed upped their bid to $385 million and urged creditors to consider the likelihood that the Carlyle-Thomson deal would never get approved. Carlyle would eventually offer another $20 million, plus a $20 million nonrefundable deposit. That was enough, and the judge awarded LTV's missile division to Thomson and the aircraft division to Carlyle. The boys from Carlyle had finally done it. They had gone up against the best, and won.

Augustine said of the decision, "Even when it's over, it ain't really over;" words that would prove to be prescient. Sure enough, the Bush administration went on record opposing the sale, and Congress voted 93–4 that selling LTV to a French company would be "detrimental to the national security interests of the United States." Despite the assurances that Carlucci had gotten from the Pentagon, the sale never really had a chance in Congress. Thomson would eventually pull out of the running altogether, flinging the door open to renewed bidding, and getting Augustine back into the game. The race was on again.

This time Carlyle teamed up with Loral Corp. and Northrop, more formidable partners than Thomson, not to mention American companies, and finally outbid the Marietta-Lockheed team with a price of $475 million. They renamed the division Vought

Aircraft and managed to turn the flailing company around. Carlyle's contribution to the sale was $38 million, a stake that the company would then sell back to Northrop Grumman for $130 million in just two years. It was a lucrative deal. And it legitimized Carlyle's band of ex-politicians in the wheeling and dealing world of defense buyouts.

Finally, Carlyle was being viewed as a player. Though still accused of practicing access capitalism and suffering a number of brutal early setbacks, the LTV deal burnished their reputation as serious competitors, willing to do whatever it takes to make a deal happen. In conjunction with the BDM deal, Carlyle now had to be taken seriously around the Beltway. But there was another deal in the works that would really put Carlyle on the map—the world map.

6

AN ARABIAN WHITE KNIGHT

Politically, it could be considered a quid pro quo for the United States.

—Shafiqul Islam, senior fellow at the Council on Foreign Relations, *Washington Post,* February 22, 1991

Cast of Characters

Prince Alwaleed bin Talal bin Abdul Aziz Al Saud	Saudi Arabian prince, billionaire, international investor.
King Fahd	King of Saudi Arabia.
Faissel Fahad	San Francisco lawyer, friend of Prince Alwaleed.
Prince Sultan bin Abdulaziz	Saudi Arabian defense minister.
Stephen Norris	

The early part of 1991 was literally an explosive time in the world. Bombs were raining down over Baghdad in the latter stages of the Gulf War. Scud missiles were careening their way past U.S. defenses in Saudi Arabia. And the savings and loan crisis had the nation's economy in full retreat. But this rare and tragic confluence of events had set up one of the best business deals of the year, and possibly the decade. A deal that would put Carlyle on the front page of newspapers around the world.

Prince Alwaleed bin Talal bin Abdul Aziz Al Saud, more economically known as Prince Alwaleed bin Talal, was 35 in 1991 and

eager to invest his fortunes across the world. The nephew of Saudi Arabia's King Fahd bin Abdul Aziz Al Saud, the Prince was a glamorous, wealthy jet setter who had spent much of his formative years studying in the United States. After earning his bachelor's degree in business administration at tiny Menlo College in California in 1979, he went to Syracuse University in upstate New York to get his masters in social science. Upon returning to Saudi Arabia, the Prince immediately began building his investment portfolio, mostly in real estate and construction. At first, he wasn't so good at it, and he burned through a $30,000 gift from his father within months. At that time, he approached Citigroup in Riyadh, an American bank, to ask for a loan. They rejected him flatly. But he went on to accumulate millions, at least some of which came through acting as a liaison between foreign construction contractors and local businesses, though the source of much of the Prince's fortunes remains unknown. Through his gains, he formed the Kingdom Holding Company, an investment vehicle through which he could play with his millions. But the Prince was looking for more, much more. He was looking toward investing in America.

The timing was right. America and Saudi Arabia were cooperating on defeating Saddam Hussein's aggression in Kuwait. It was one of the first times the United States and Saudi Arabia had their political agendas in line. Saudi Arabia had committed more than a hundred thousand troops to the conflict in the gulf, and those soldiers were fighting beside American troops. Many saw this as the dawn of a new era of cooperation between the two nations, both politically and financially. And they were right.

Back at home in the United States, the mighty banks were gasping for air. Stocks were plummeting all around the financial sector, and bankruptcies were not uncommon. The fallout from the savings and loan crisis was littered along Wall Street. It was on this shaky ground that Citicorp, America's largest bank at the time, found itself in February 1991. The company's stock had collapsed,

losing half its value between the summer and winter of 1990. It was in desperate need of financing, a lot of financing. Citicorp was looking for as much as $1.5 billion to stay afloat, and they were hoping to raise it through the sale of stock. They were looking for a white knight.

A Saudi Savior

Enter the Prince. Prince Alwaleed was watching the events in the United States closely, as he always did, and he had decided it was time to put his money to work in America. Known for his eccentricities, the Prince would often drag a caravan of trucks out into the desert to relax. There, with the baking, barren desert glowing all around him, he would sit in a tent complex, entertain guests, and watch multiple satellite television hook ups, staying abreast of world news. A seasoned critic of American media, he had been following the saga of Citicorp from the beginning. He decided it was time to invest.

Working through his representative in the United States, San Francisco lawyer Faissel Fahad, the Prince was put in touch with a prominent DC-based law firm. Because of the tricky political nature of a deal involving a major U.S. bank and a foreign investor, the firm felt they needed an advisor that offered more than just traditional investment banking advice. They decided they needed the Carlyle Group, to help them navigate the choppy waters of federal approval for the deal. After all, Carlyle had the government connections, they were based in DC, and a sensitive deal like this was going to need a delicate political touch. They called Norris.

The Prince had loads of cash, and Citicorp needed it. But at the time, Treasury Secretary Nicholas Brady had been pushing reform in the banking industry, to allow banks more flexibility in the types of business they could enter. It was intended to diversify

banks from the disastrous savings and loan business, and strengthen the industry by giving it more options. But there was concern that opponents to the legislation would use the fear of foreign ownership in American banks as a sticking point to hold up the reform. A deal between a wealthy Saudi Prince and the nation's largest bank was all reform opponents needed to prove their case. It was, to say the least, a very sensitive time in the banking industry. Norris and the Prince knew this, and the two worked hard to structure a deal with Citicorp that would allay any and all concerns, but still get the much-needed capital into the hands of Citicorp.

Norris and the Prince spoke often, sometimes two or three times a day, for hours on end. One conversation was temporarily interrupted while the Prince watched the American Patriot Defense system shoot down an Iraqi Scud missile outside his window. Unphased by the attack, the Prince and Norris picked up the conversation where they had left off. "It was a crazy time," remembers Norris. "The Prince and I were extremely close. I have a passport full of Saudi stamps. I don't even know how many times I went over there."

The negotiations were cordial but intense. During the dealmaking process, Norris asked Citicorp for a board seat in return for the Prince's investment. It was a pure red herring. A shrewd negotiating tactic, designed to be dropped in a show of concession, which it later was. Neither the Prince nor Norris thought they would get it. In fact, they knew it would make the Federal Reserve Board's approval of the deal nearly impossible. But it worked to perfection.

After months of preparation, they got the deal preapproved by the Federal Reserve Board (Fed), by conceding measures they never intended to secure and assuring members that the Prince would be a passive investor. The thinking at the Fed was that everyone wanted the Prince to invest his money to save Citicorp, they just didn't want him to exercise any control over his

investment. It was a lot to ask, but Norris and the Prince had expected it. The Fed also spent months researching where the Prince's money was coming from. Rumors that Prince was acting as a front for other investors ran rampant. There was concern about Middle Eastern investors using the Prince to launder their money. But finally, the Fed relented, and the deal went through.

On February 21, 1991, a mammoth deal was announced. The Prince would be purchasing $590 million worth of stock in Citicorp, and bailing out the bank that once turned him away when he needed a loan back in his home country. The shares were nonvoting preferred stock, which meant that the Prince could not vote his shares in proxy battles. But, he would be allowed to convert the shares to common stock at an exercise price of $16 a share in just eight months. He already owned 4.9 percent of the common stock, which he had acquired over time in the fall of 1990. That meant that if he were to convert his shares in October 1991, he would hold almost 15 percent of the common shares. In other words, he would be one of the company's largest shareholders.

Media Misteps

The stock jumped up 8 percent in the week following the announcement, and the press was all over the news. Who was Prince Alwaleed? How did he get so much money? Who is the Carlyle Group? Would the Prince be seeking a board seat in return for his investment? Is this a new beginning for financial cooperation between Saudi Arabia and the United States?

There with the answers to all of these pressing questions, in all his glory, was Stephen L. Norris, the co-founder of the Carlyle Group and the man who had engineered the biggest deal of the year. He was quoted everywhere, and figured prominently in a *BusinessWeek* profile of the deal. Norris told the press that the Prince would not be asking for a board seat. But that he didn't

plan to be completely passive either. After all, who invests $590 million of his own money and doesn't expect his voice to be heard on important decisions? No, Prince Alwaleed would be an "active" investor, said Norris.

Norris' statements proved to be well off the mark, and they set off the alarm bells at the Federal Reserve Board, the same board that had already been promised Alwaleed would remain a passive investor. Originally, the Fed had been assured that Alwaleed would not attempt to "influence management" for at least five years, though he would be allowed to speak his views to the board of directors, says Norris today. That was the deal. But Norris' statements to the press after the deal appeared to contradict that agreement, and the Fed wanted some answers.

The Prince's people feverishly worked the phones that next day, desperately trying to convince the Fed that Norris was out of line, not expressing himself clearly, and that the Prince had every intention to remain passive. In the middle of all of this, a 1988 article in *Forbes* surfaced, in which Alwaleed is quoted as saying the role of the passive investor is not for him. "I want my voice to be heard . . . I would love to be a corporate raider," he said. Suddenly, the whole reason that the Prince had chosen Carlyle in the first place—to help him traverse the rocky regulatory terrain—had blown up in his face.

In addition, the Prince took grave offense at what he perceived as Norris taking credit for the deal in the press. The Prince, not unreasonably, wanted to be seen as the savior of Citicorp. Instead, Carlyle was getting all the credit. Norris' Carlyle partners also felt he was becoming too personally involved in the success of a client, too public. The fiasco that resulted began the long, drawn-out process of Norris' excommunication from the firm.

Ultimately, and after much cajoling, the Fed allowed the deal to go through. But they forced the Prince to sell the 4.9 percent of common shares he had previously accumulated, and mandated that he not own more than 9.9 percent of the overall stock.

The move cost the Prince millions in future profits. It was a public sign from the Fed that they were going to remain extremely vigilant. With his newly acquired shares of Citicorp, Alwaleed had also bought himself a very high profile in the United States. His moves would be scrutinized by regulators and investors alike. The rumors that Alwaleed was investing money on behalf of Middle Eastern investors that don't want their identities revealed continued to dog him. The accusations were adamantly denied by Alwaleed—and are still denied to this day. (Those who know him say the Prince sees himself as a link between the Arab world and America—a Saudi with a soft spot for true capitalism.)

A Source Emerges

Then, in the Spring of 1991 shortly after the Citicorp investment, the Bank of Credit and Commerce International (BCCI) scandal ripped through the banking world like a missile. The fifth largest private bank in the world, as it turned out, was nothing but a fraud-ridden front, laundering money for drug lords and terrorists throughout the Middle East. BCCI was also trying to gain control of American banks. It was a scandal of epic proportions that brought down dozens of high-profile members of the international banking community. It was the largest bank fraud case ever. And it didn't bode well for the Citicorp deal.

After BCCI, the media speculated that Alwaleed might be up to the same thing. In an interview with CNBC 10 years later, Alwaleed described the situation like this, "We had Arabs involved with BCCI at that time. And they had a big scandal there, unfortunately. They (the Fed) looked at what I had there, we had a big discussion, long discussions, they could not find anything wrong with it at all. But I got the message that they were in a difficult position."

The Fed was indeed in a difficult position in trying to save Citicorp—the nation's largest bank. According to one person involved in the Citicorp negotiations, the Fed suspected that the money Alwaleed was investing was not his own, and officials there "looked the other way." The source says that the lack of due diligence in adhering to the rules that require transparency of foreign investors facilitated the Fed's goal of saving Citicorp. A source close to Alwaleed now says that at least some of the money belonged to Prince Sultan bin Abdulaziz, Saudi Arabia's defense minister. The defense minister could not be reached for comment, and the Prince maintains that all of the money he invested was his. Since the Citicorp flap, Alwaleed has regularly, and voluntarily, disclosed selected investments to the public, even though he is under no obligation to do so. But he only discloses what he wants to.

Despite its controversial nature, the Citicorp deal put both Carlyle and Alwaleed on the map. Many believed the deal was the financial embodiment of the political accord between the United States and Saudi Arabia. In a *Washington Post* article at the time of the deal, Shafiqul Islam, senior fellow at the Council on Foreign Relations in New York, said "here the profit motive and the political motive seem to coincide. Right now, the Saudis are our good friends, and Citicorp does need the money." Politically, it could be considered as a quid pro quo for the United States "helping them" in the Gulf War. It was a rare time when the United States and Saudi Arabia were both politically and financially aligned, and it opened a brief window of opportunity for Carlyle and the Prince. But it wouldn't always be that way.

Surprisingly, considering the magnitude of the deal, Norris and Carlyle walked away with a mere $50,000 of the Prince's money (they were paid more handsomely by Citicorp, though they won't disclose how much). And the Prince? After a nervous year during which the Prince's investments were underwater—a time when Rubenstein routinely fretted over Citicorp's languishing

stock—today's estimates fall somewhere between an $8 billion and $12 billion profit on the deal. It made all the trouble seem worth it. And it set Carlyle up for a future with the Prince, including another major bailout by Alwaleed of Euro Disney (an investment that hasn't turned out so well). But more importantly, the deal gave Carlyle access to Saudi Arabia, a country of unimaginable wealth if one knew where to look. "The deal gave us an enormously high profile in Saudi Arabia," recalls Norris. And with the Prince on its side, Carlyle had the world's best tour guide to pry open the treasures of Saudi Arabia.

7

VINNELL'S EXECUTIVE MERCENARIES

We train people to pull triggers.

—A potential Vinnell employee, *Newsweek,*
February 24, 1975

Cast of Characters

Henry Jackson Former U.S. senator.

Richard Secord Retired Air Force general, ex-employee of Vinnell, Iran-Contra fall guy.

After its early buyout misadventures, Carlyle had finally tasted fortune in both the BDM deal and its work with the Prince. In 1992, the time came to combine their newfound successes, when BDM, by then already under Carlyle's ownership, bought a little known company of ambiguous ownership named Vinnell. The deal would marry Carlyle's burgeoning expertise in defense with its incipient relationships in the Middle East. And it would forever strengthen the political ties between two of the world's most powerful countries.

Vinnell is the clearest example of Carlyle's business inside the Iron Triangle. It combines all of the necessary elements of the military, government, and big business, in one neat, utterly secretive package. Vinnell defines the term *war profiteer,* a private

company that trains foreign militaries in times of need, and would ultimately make Carlyle an insidious force inside the Kingdom of Saudi Arabia. Vinnell is yet another company with a highly controversial past that Carlyle snapped up, only to heighten its questionable legacy. Vinnell's history, before, during, and after Carlyle owned it, is a litany of covert operations, mercenary missions, and cover-ups: right up Carlyle's alley. Carlyle, it seemed, was building an entire portfolio of controversy, and Vinnell was the early centerpiece.

The relationship between the United States and Saudi Arabia has grown increasingly complex and co-dependent in recent years: the United States gorging itself on Saudi Arabia's cheap oil, and the Saudi's relying on American military support of the royal family. This give-and-take relationship has made navigating the post-September 11 political waters very tricky. Despite a near total lack of cooperation in the bombing campaign of Afghanistan and the investigation into September 11, Saudi Arabia remains the United States' chief ally in the Gulf. In response to Saudi Arabia's obstruction, senators have come out with strong rhetoric toward the Saudis, calling the regime corrupt. Some have accused them of sponsoring terror, or at least doing nothing to abate it. Others have recommended an end to the alliance between the two nations. But the relationship, however tenuous, holds. Like the oil that trades hands between the two countries, the United States holds Saudi Arabia in a slippery, combustible embrace.

Saudi Arabia's military dependence on the United States can be traced back to a Vinnell deal in 1975 that would alter the nature of the alliance forever. Of all the military ties the United States has fostered with Saudi Arabia over the last three decades, perhaps no one company has done as much to inject the American military machine into everyday life in Saudi Arabia than Vinnell. It was, and still is, an integral part of the Saudi military makeup.

A Company with No Past

Until Carlyle, through BDM, purchased Vinnell in 1992, the company virtually didn't exist to the public. Even though Vinnell claims to have been around since the days of the Great Depression, documentation of its history is nearly impossible to find. No publicity, no press releases, no news clippings. To this day, no one knows who the original owners were. Reports indicate that Vinnell, at one time a heavy construction company in Los Angeles, built Dodger Stadium. Then the company built some airstrips in Vietnam. But it wasn't until 1975 that the company mistakenly flew temporarily above the radar and into the public's view.

In February 1975, the Associated Press broke a story that sent shock waves through Washington. A private American firm was hired by the Pentagon to train Saudi troops to protect oil fields from potential aggression in the Middle East. The news came just two years after the United States had pulled its final remaining troops out of Vietnam, and Americans saw the action as yet another ill-conceived involvement in a foreign nation's affairs. Only this time, it wasn't enlisted soldiers, working for the American Armed Forces. It was soldiers of fortune, civilians with guns.

The $77 million contract, brokered through the Defense Department, stipulated that Vinnell would hire 1,000 former Special Forces personnel, most of whom had recently served in Vietnam, to work with the Saudi National Guard, the 26,000 men sworn to protect the royal family. Never before had a private company, employing civilians, been deployed overseas to train a foreign government in battle tactics. But it would not be the last time.

The news caused instant outrage on Capitol Hill. Congressmen accused the Pentagon of hiring "mercenaries" to develop the military of a country the United States may one day have to invade. At the time, U.S. oil companies complained incessantly to congressmen that Saudi Arabia and the Middle East were

strangling the United States by manipulating the exportation of oil. Henry Kissinger himself had threatened an invasion of Saudi Arabia if the situation did not improve. With tensions rising between the two nations, the Vinnell deal left lawmakers scratching their heads. Senator Henry Jackson, of Washington, demanded a congressional inquiry and was quoted as saying he was "completely baffled," by the deal, adding that to his knowledge, the only threat to Saudi Arabia's oil fields had come from the United States itself. And we certainly weren't going to train the Saudi National Guard how to defend themselves against us, were we?

U.S. companies had regularly scored contracts for training foreign nations in the use of American-made military equipment. But training men in battlefield tactics and combat was considered off limits. It was viewed by many as a way for the government to get around laws that prohibit the United States from getting involved militarily in certain nations, an issue that was particularly raw following America's disastrous foray into Vietnam. It was a quiet, though expensive, way to further America's agenda abroad without committing its own troops.

The type of men Vinnell was recruiting for the job led to consternation from others in the military training industry. This was not your typical service contract. The head of one security company at the time of the deal told *Forbes* that "the whole thing stinks. You're talking about professional killers, very senior Special Forces guys on this Vinnell contract. These aren't personnel specialists. They've got tremendous combat reputations. What kind of control does Vinnell have over them once they get over there?"

In the same article, William L. Hilger, corporate secretary for Vinnell at the time of the deal, told *Forbes,* "This isn't anything new for us. We've done all this sort of stuff with the Chinese Nationalists, the South Koreans, the South Vietnamese . . . We teach them to rebuild their ordnance equipment, repair their vehicles for

them, operate and maintain their airbases, their drydocks, install and operate their power system, everything."

The Pentagon, embarrassed by the press leak of the deal, went into defense mode, assuring Americans that the Vinnell personnel would not be instructing the Saudi National Guard in ground tactics and maneuvers (Vinnell employees were seen fighting with Saudi troops in the Gulf War 15 years later). Defense Department spokesmen explained that the United States was trying to wean foreign governments off of U.S. military manpower, steering them toward private companies instead, which frees up active troops for more pressing action. It was the beginning of privatization in the defense industry, a trend that would burgeon over the following two decades and make Carlyle very rich. The Vinnell contract was characterized as a one-time training mission, a quick in-and-out. Twenty-seven years later, Vinnell is still well entrenched in Saudi Arabia, though Carlyle sold the company in 1997.

At the time, Vinnell spokespeople played down the significance of the announcement, defending themselves against claims that they were nothing but a ragtag group of mercenaries. One former U.S. Army officer, while waiting in line to apply for a position in Saudi Arabia (Vinnell had to hire on most of the men for the job due to a lack of experience in this type of work), told *Newsweek* "We're not mercenaries because we're not pulling the triggers. We train people to pull triggers." Hundreds of young men applied for the positions, which were advertised in local newspapers. It was a truly frightening trend for Americans to watch evolve.

Senator Henry Jackson finally got his congressional investigation into the Vinnell deal. And the results were difficult to fathom. The probe yielded a stunning contract clause that barred Jews from working on the contract. Because of the sensitivities between Arabs and Jews, which ran very high in the mid-1970s, Vinnell had agreed to the obviously anti-Semitic clause. The investigation also turned up a suspicious $4.5 million agent's fee that investigators thought was a kickback to the royal family. But

in the end, the anti-Semitic clause was dropped, and no charges were filed. Vinnell was free to go ahead with the highly controversial, highly profitable, contract in Saudi Arabia.

Going Dark

Then Vinnell disappeared again. Like a shadow at night, the company seemed to have the disconcerting ability to disappear when it needed to, just go dark. It wasn't until the Iran-Contra affair that Vinnell resurfaced temporarily. Richard Secord, a retired Air Force general who worked for Vinnell in the mid-1980s, was implicated as Oliver North's accomplice in the well-known arms-for-hostages scandal. As part of the voluminous press coverage of the scandal, Secord's background was thoroughly investigated, and it was found that he had previously worked for Vinnell. But Vinnell managed to successfully distance itself from the investigation and from Secord, who would eventually plead guilty to lying to Congress for his involvement with Iran-Contra. But his involvement with Vinnell put the quiet company in the spotlight once again.

In a brief, confusing, and rare public reference to the company, a *Time* magazine article in 1987 picked up the scent of Vinnell when it reported that two Vinnell employees may have been tangentially involved in a failed attempt to overthrow Granada's leftist Prime Minister Maurice Bishop. It was a bizarre revelation and few in the media knew what to make of it. What were these guys doing? And does this mean Vinnell was involved with plots of regime change? The story caused a few ripples of concern, no follow-up, and then once again the company dropped off the radar. How was such an intriguing company keeping so quiet? Why did the press never seem to follow up on these strange tales?

By the time Carlyle picked up Vinnell, via BDM, in March 1992, the company had built the Saudi National Guard up to

about 70,000 troops from the original 26,000. It had also paved the way for the cooperation between the United States and Saudi Arabia in the Gulf War. Many of its employees fought right alongside the Saudis, something the Pentagon had promised would never happen, in defending Saudi Arabia from Iraq's aggression. "During the Gulf War, when a lot of companies sent their people home, BDM (and Vinnell) did not," says Phil Odeen, then chairman of BDM. "We kept our people there during war, and we got high marks from the Saudi's for that. I'm sure there were a lot of nervous people, but that was a big factor in our continued success in Saudi Arabia."

The U.S. military presence in Saudi Arabia was growing steadily after the war. The Air Force was setting up shop indefinitely in Riyadh. BDM was increasing its business. By the mid-1990s, there were about 5,000 U.S. military personnel in Saudi Arabia, and close to 2,000 BDM and Vinnell employees. But while the royal family welcomed the presence of the American military machine in its backyard, many Saudi nationals did not. It is a dichotomy that exists to this day, in which the royal family's concerns do not mirror those of the general population of Saudi Arabia. And Vinnell's presence in Saudi Arabia was exacerbating that problem. Both the royal family and Vinnell tried to keep their dealings as quiet as possible. But with so many non-Arab employees working in and around Riyadh, the secret got out. Tensions steadily rose, and then, disaster struck.

Hate Boils Over

In November 1995, a car bomb ripped through the Riyadh offices of BDM and Vinnell, killing seven people, including five Americans. Three spouses of Vinnell employees were injured in the blast. The offices that were targeted were those supporting Vinnell's National Guard contract. "One of them got cut up badly,"

remembers Odeen. Unlike a U.S. embassy, a typical target for this kind of terrorism, the building that housed Vinnell's people were purposely nondescript. The workers kept as low a profile as possible. Vinnell's employees knew they were an unwelcome presence to the majority of the population. "There was a fair amount of security concern," recalls Odeen. "You didn't drive around with an American flag in your car." But it didn't matter. The radicals responsible for the explosion knew enough to attack the Americans where they worked. Vinnell was fooling nobody.

The bombing set off a feeding frenzy by the national media. It was as though the Vinnell story was brand new, and everyone had questions. What were these people doing in Saudi Arabia? How did the Saudis know they were there? Why were they targets? The answers would turn out to be far more sinister than anyone suspected.

According to one former board member of Vinnell, who wishes to remain anonymous, Vinnell had been a cover for the CIA for decades. Dating all the way back to 1975, the company was gathering intelligence on behalf of the U.S. government, by infiltrating the Saudi National Guard under the specious guise of military trainers. The board member also says that though the company was supposed to be nothing more than a front for covert intelligence gathering, the darn thing started making money. The board member likened the operation to the Hollywood movie *Swordfish* starring John Travolta, in which secret operatives from the government end up making a fortune off of companies designed to be fronts for the Drug Enforcement Agency.

According to this board member, even after BDM purchased Vinnell in 1992, there was very little anyone on the board did in terms of overseeing of Vinnell. Board members met regularly, but rarely was anything acted upon. The company that seemed to run itself was, in fact, being run by someone else.

If true, the company's murky history starts to make more sense. The ambiguous ownership. The fits of secrecy. The peripheral

involvement in Iran-Contra and Granada. And finally, the targeting of Vinnell by Saudi nationals. For his part, Odeen demurs when presented with this revelation. "I know nothing about it being a CIA front," says Odeen. "I knew it to be a first-rate training organization." But first-hand sources, one of whom sat side by side with Odeen on the Vinnell board, say otherwise.

Today, Vinnell continues to do its work in Saudi Arabia, since 1997 as a subsidiary of TRW. Whether it is a front for CIA activity is unclear. The company is among many that have come under political attack in the wake of September 11, and has been held up as an example of why it is so difficult for the United States to cut ties with the Saudis during the War on Terrorism. William Hartung, a foreign policy expert at the World Policy Institute, in referring to Saudi Arabia's stonewalling of the United States following September 11, was quoted as saying "If there weren't all these other arrangements—arms deals and oil deals and consultancies—I don't think the United States would stand for this lack of cooperation." And it's not just Vinnell. The company led a tidal wave of private American military into Saudi Arabia. Today, it is estimated that between 35,000 and 45,000 employees for outfits like Vinnell are living and working in Saudi Arabia. It is becoming nearly impossible to distinguish America's real military from America's soldiers for hire.

Carlyle has certainly had more pedestrian investments than Vinnell, but it's had more controversial ones as well. It's safe to say, that after the purchase of Vinnell, Carlyle entered new territory that separated the company from other buyout giants like Kohlberg Kravis Roberts and Co. Alleged CIA cover ups, car bombs, purported executive mercenaries may sound like a Hollywood movie script or a far-fetched work of fiction, but it's all in a day's work for Carlyle.

8

OUT OF THE SHADOWS

A Republican administration in exile.

—*Time* magazine, March 22, 1993

Cast of Characters

James Baker III	Carlyle executive, former secretary of state under President George Bush Sr.
Richard Darman	Carlyle executive, former director of the Office of Management and Budget under President George Bush Sr.
Colin Powell	Former Carlyle advisor, secretary of state under President George W. Bush.
Michael Eisner	Chairman of Walt Disney.
Antonio Guizzetti	Italian business man, friend of Steve Norris.
Basil Al Rahim	Former Carlyle employee in charge of raising capital in Middle East.
Stephen Norris	
William Conway	

By the beginning of 1993, Carlyle was a somewhat seasoned, if not terribly successful, private equity firm. Six years and a dozen or so buyouts after Rubenstein and Norris joined forces at the Carlyle Hotel in New York, the firm had made some huge deals happen. It had also participated in some major flops. The company had stakes in 10 companies valued at around $2 billion.

But the bottom line was that the Carlyle was not making the gobs of money its co-founders had hoped it would. And the time had come to kick it into gear.

In 1993, Carlyle began a rapid transformation, from an eager young private equity firm into an international political and financial powerhouse. They brought in the high-priced, high-profile talent that would ultimately define the company. They shed some of their old, bad habits, one of which happened to be Steve Norris, the co-founder of the company. And the result was nothing short of astounding. The moves the company made between 1993 and 1995 would cause some growing pains within the firm, but would also lay the groundwork for the new Carlyle—the company kicked off the training wheels and began to tear around the international business community. All of which began with a very important hire, and ended with a tragic but inevitable firing.

To this point, the company was still operating without a chairman. Carlucci had settled nicely into his role as vice chairman. Aside from opening the doors of defense to the Carlyle Group, he was now residing on the boards of an astounding 32 companies, not all of them owned by Carlyle. He was ridiculously well connected. His time was precious, and he was not highly involved in Carlyle's day-to-day deal making. While Carlucci was a serviceable figurehead, he was a bit detached, and didn't exactly reek of credibility. In referring to Carlucci's status value and lack of business acumen, Rubenstein was often overheard around the office saying, "we all know what Frank is . . ." Carlucci was invaluable in Carlyle's dealings in defense. But he was not the marquee name the company needed to really go global. Carlyle needed someone who could help raise money. Someone that would make the world stand up and take notice. Someone universally admired and respected. Someone like James A. Baker III.

A Trophy Hire

Baker, like Carlucci and Rumsfeld, attended Princeton University, and graduated in 1952. (The more you research the backgrounds of the key figures in Carlyle, the more you end up at the same place: Princeton.) He then spent almost 20 years toiling with Houston law firm, Andrews and Kurth. But in 1975, he would enter American politics when he became the Undersecretary of Commerce for then President Ford. He would not leave politics again for the next 18 years. During that time, he would lead presidential campaigns for Ford, Reagan, and Bush. He would serve as Reagan's White House Chief of Staff from 1981 to 1985, then secretary of the Treasury from 1985 to 1988. After leading George H. W. Bush to victory in the 1988 presidential election, he would be rewarded by becoming the nation's sixty-first secretary of state, a post he would hold from January 1989 to August 1992. For the last few months of Bush's time in office, Baker again became White House chief of staff, until January 1993, when after failing to get his boss reelected, he resignedly cleaned out his office to make way for the incoming President Clinton, ushering in eight long years of Democrats in the White House.

All told, Baker had been camped in the White House for 12 years straight. He was, and still is, a consummate statesman, and a steadfast Republican. Carlyle, with its offices at 1001 Pennsylvania Avenue, just a few blocks from the White House, with a distinctly Republican flavor, made a compelling offer to Baker. It's not as if Baker had a paucity of offers either. Publishers urged him to write his memoirs. Rice University, in Baker's hometown of Houston, wanted him to run a foundation. Enron made overtures. So when the boys from Carlyle knocked on his door, they weren't sure what to expect.

Rubenstein, Conway, and Norris went to the White House to make their pitch during the White House transition, and in the

waiting room, they ran into David Rockefeller, the next in line to see the man of the hour. They knew then that the competition for Baker's services was going to be stiff. After an hour-long meeting with Baker, however, they felt considerably better about their chances of landing the outgoing administration's biggest fish (aside from the president himself, of course). Baker was intrigued by the offer, and he invited Richard Darman, Bush's outgoing budget director, to get involved. Darman convinced Rubenstein that if Carlyle wanted Baker, they were going to have to take him, too. He made it a package deal.

On February 24, 1993, the news release hit the wire that Richard Darman, former director of the Office of Management and Budget, was joining the Carlyle Group as a managing director. Darman was a former executive at Shearson Lehman Hutton, Inc., and combined with his years of government service, would make an excellent investment advisor in sectors heavily affected by government regulation, like energy, transportation, and insurance. Two weeks later, days after accepting another job consulting with Enron on overseas projects, James Baker became a partner at the Carlyle Group. Carlyle had officially appeared on the radar screen.

Suddenly, every media outlet wanted to find out more about this quiet little merchant bank called the Carlyle Group, and it seemed that every writer had the same idea. Ten days after Baker was hired, *Time* magazine ran a story entitled "Peddling Power for Profit." In it, the magazine referred to Carlyle as a "Republican administration in exile," and reported that Colin Powell was also considering a job offer from the group. Powell and Carlucci were very close from their days together on Reagan's National Security Council. Then the *New Republic* wrote a scathing cover story later that year entitled "The Access Capitalists," which portrayed Rubenstein as a nervous, paranoid wreck, obsessed with the media's portrayal of Carlyle. His fears proved warranted. In a *New Republic* article, writer Michael Lewis called the company a

"salon des refuses for the influence peddling class." It went on to say, "[Carlyle] offers a neat solution for people who don't have a lot to sell besides their access, but who don't want to appear to be selling their access." It was not the kind of public relations coup Rubenstein was looking for when he went combing through the remains of the former Republican White House. The stinging accusations and acrid characterizations first levied in these articles would follow the company to this day.

Baker's hiring caused some waves inside Carlyle as well. Rubenstein and Norris, who were running the firm at this point, were concerned that Carlucci would want out when Baker came on board. After all, it would be hard to argue that Carlucci would be of more value to the company than Baker. It seemed reasonable to assume that Baker might be Carlucci's boss. It wasn't clear which one was going to be more senior. So in a preemptive case of ego-stroking, the firm decided to bring Baker in as a partner and promote Carlucci to chairman. But former employees agree that the new title was purely for outside appearances. One former employee would say of Carlucci, "Frank was a good guy to have around, even though he was rarely there. But when we had a tough problem to tackle, no one said, 'Hey, let's go show this to Frank and see what he comes up with.' " Carlucci and Baker also clashed over politics. When he was in the Carlyle offices, Carlucci was often overheard badmouthing former President Reagan, the man who appointed him national security advisor and secretary of defense, saving him from the nightmare that was Sears World Trade. Baker, a devoted Reaganite, didn't take lightly to Carlucci's disrespect. And Norris, a huge Reagan fan, would often remind Carlucci that it was Reagan who "made you who you are," a jab that went unappreciated by Carlucci. But Carlucci and Baker's differences were miniscule compared to the other clashes to come in Carlyle's testosterone-laden executive ranks.

Darman and Rubenstein's personalities clashed badly early on. Rubenstein phoned Norris in Paris one day to say he had

reached the end of his rope and that something had to be done. It was a classic style clash. The two eventually had to work out an arrangement limiting Darman's role in management in order to get along. The tensions inside the company were growing along with the company itself. As with any company that achieves success, Carlyle was finding itself at a crossroad between the past and the future, and the strain was weighing on its executives. Power struggles were common, and not the least bit private. The entire office saw management openly sniping at one another. But no one could have understood the severity of the split that had opened up between fellow co-founders Steve Norris and Bill Conway. And this was the battle that would be the turning point in Carlyle's history, the winner defining how business would be done going forward, the loser left to carve out another future, away from Carlyle.

A Chasm of Character

Norris' relationship with Conway had almost completely deteriorated by the mid-1990s. There were major differences of opinion on business issues. But this particular feud got increasingly personal over the years. Two men could not have had more wildly disparate styles. Norris loved "elephant hunting," wheeling and dealing, striking out occasionally, but all the while looking for the deal of the century, the one that would make them all rich beyond their dreams. He spent money lavishly, spoke out of turn, and followed his own instincts. Some call him mercurial, a term he dismisses by claiming not to know the definition. Some call him a loose cannon. But no one denies the important impact that Norris had on Carlyle. "In the beginning, it was all Steve," recalls one employee. "David and Steve. Steve and David. That was all anybody knew. Between the two of them, they got it all done."

Conway, on the other hand, was conservative to a fault. He deplored wastefulness and railed against unnecessary expenses. He was a button-down businessman from New England. His father wrote the book on quality . . . literally. William E. Conway Sr., a world-renowned quality consultant, first wrote *The Quality Secret: The Right Way to Manage* in 1996, and followed it up with *Winning the War on Waste: Changing the Way We Work* in 1997. Conway's father was also the first American CEO to embrace the teachings of Total Quality Management (TQM), a corporate trend that would sweep through American business as capriciously as the Macarena affected American dance. Knowing this, it is not difficult to understand why Conway found Norris' footloose style of deal making deeply offensive. And why Norris felt threatened by Conway's staid approach to business. If you didn't know any better, you'd have thought Conway was playing the role of controlling father to Norris' troubled adolescent in Carlyle's internal drama.

The rift between the two was damaging morale at the Carlyle offices. Without solidarity at the top, there was little to keep the younger MBA types from fracturing and feeling put upon. One former employee remembers the office at the time like this: "It was not a place where you sensed joy or even teamwork. There was no camaraderie. It was a tough place to be, where most of the economics went to the senior guys, and they didn't even like each other. It was hard for the younger guys to see how they were ever going to make money. A huge amount of the firm was going to a bunch of guys who didn't even do deals." Things got even worse, and even pettier.

Norris recalls a painting he bought for about $5,000 for his wife at the time that hung in his living room. Later when the Norrises hosted a cocktail party at their home, Conway and his wife saw the painting and were beside themselves. Apparently, Conway's wife had intended to buy the same painting. According to Norris, the rivalry between the two had grown so fierce, that the

Conways were convinced that Norris had bought the painting just to stick it to them. Norris claims he had no idea the Conways had designs on the painting. The petty jealousies and name calling of the super rich can be astonishing to the rest of us.

By 1993, it had become appallingly clear that Norris' time with the firm was going to end badly. Conway had begun to manage Carlyle's defense buyout business, taking over the day-to-day dealmaking responsibilities that Carlucci had helped put in place. By this time, Norris was spending a great deal of time and money setting up shop in Paris as he worked a deal between the Prince Alwaleed and Euro Disney, an operation badly in need of some financing. Norris wasn't afraid to enjoy his successes, and when he was in Paris on business, he stayed at the Ritz Carlton. He also availed himself of some free time while traveling on business. He didn't dwell on the minutia of high finance. He likes to tell a story that illustrates the difference in work ethics between himself and David Rubenstein. Bill Conway came in to the Carlyle offices one weekend to pick up some work. Rubenstein was there, huddled over his desk, feverishly writing a memo, with Norris relaxing on his couch. Conway asked Rubenstein what he was doing, and David said, "writing a memo." Norris and Conway teased him, until Rubenstein asked Conway what he liked to do to relax, to which Conway replied, "play golf." Rubenstein then said, "Think of this as me playing golf." Suffice to say given Norris' position on the couch, he didn't write memos to relax.

While Norris was negotiating with Michael Eisner and crew for the Prince's eventual $360 million investment into Euro Disney, he was racking up healthy expense reports. One day, in the midst of heated negotiations, he decided to go shopping. "I could see that it wasn't going anywhere," Norris says of the negotiations. "If I wasn't available, nobody could talk to anybody, and tempers would calm down, and we could reach a compromise." It was a decision for which Conway could never forgive him. Carlyle eventually did get the deal done, but the folks back in Washington

objected to the amount of money it was costing them and Norris' laissez-faire attitude in Paris. Norris claims that he could have spent less money, but not much less. However, in talking about this contentious time in the company's history, he lets slip, "I was in my suite at the Ritz . . . well, my room at the Ritz . . . I was accused of having a suite, but I really didn't."

By this time, Norris alienated the Prince by turning down a job offer from him, pissed off Michael Eisner during the Disney negotiations, and ran up a monster expense tab in Paris. His partners were losing patience. "He has no discipline," says Stan Anderson, a partner at McDermott Will & Emery in Washington, who worked with Carlyle, especially Baker, on a few early deals. "On a bike trip in Europe, Eisner lambasted him for bringing an undisciplined approach to the negotiations," says Anderson. "He was basically living in Paris, and he was living too large."

Norris' Last Stand

The final straw for Norris came when he drummed up a potential piece of business with a man he met in a sauna. (Norris and saunas seem to have a long history at Carlyle—rumors abound at Carlyle about Norris' alleged sexual exploits with a female employee in the Carlyle office's sauna, an adventure that allegedly ended badly when it triggered the fire alarm and evacuated the building—a rumor that Norris flatly denies but other former employees swear is true.) After a workout, Norris started up a conversation with an Italian businessman in the steam room of their fitness club. The man was Antonio Guizzetti, the Washington, DC, representative of ENI, a massive Italian oil exploration firm. Norris smelled a deal. "He wanted to internationalize Carlyle," recalls Guizzetti. "To that point, Carlyle International didn't exist."

Norris and Guizzetti struck up a friendship. It was classic Norris, always looking for deals, even in the sauna. The two tried all

sorts of deals at first. They met with Italian designer Giorgio Armani. They met with Paolo Bulgari, of Bulgari Jewelers and nearly cinched a deal to buy 10 percent of the company for only $5 million. ("If we had finalized the deal with the Bulgaris we would be multimillionaires right now," laments Guizzetti.) But in the end, the deal they decided to pursue was a buyout of IP, the retail unit of Italian oil company AGIP, a subsidiary of ENI. AGIP had built up too large a market share in Italy with IP, and the European Union was uncomfortable with the potential for monopoly, so the company was looking to sell off the retail chain of gas stations. Because the deal would have major political implications within Italy and the United States, Carlyle assigned a career diplomat to assist Norris. They called in Baker.

Guizzetti, Norris, and Baker traveled around Italy meeting with ENI's top executives as well as high-ranking politicians. They secured time with then Prime Minister Carlo Azeglio Ciampi's general secretary. The met multiple times with Paolo Savona, the minister of industry privatization. Guizzetti said traveling with Baker was like traveling with royalty. "We flew in a private jet and had meetings with everybody," gushes Guizzetti. "Traveling with James Baker in Italy guaranteed that the deal was serious."

The deal was serious, and Norris began rounding up financing. Through a new Carlyle colleague named Basil Al Rahim, who had been traveling throughout the Middle East to raise money, Carlyle was put in touch with an extremely wealthy family in Saudi Arabia that wanted in on the deal. The family had amassed a fortune through construction contracts and was looking to diversify. The name of the family was bin Laden. And the relationship Al Rahim established with the estranged family of Osama bin Laden would go on to be a long-term and very lucrative partnership. But not this time.

With financing in place, regulatory issues cleared with the help of Baker, and AGIP ready to sell, Norris was suddenly asked to leave Carlyle in January 1995. The public face on the resignation

was that Norris no longer wanted to be bothered with managing money, when his real passion was for cutting deals. Rubenstein was quoted in the *Washington Post* saying "Steve is one of the most creative deal-doers in the country. He wants to do different types of deals from what we want to do." According to Norris, the reality was far more contentious and personal. Conway's cautious conservativism had won out, and Norris was to be part of Carlyle's past, not its future.

Without Norris, the IP deal fell apart. Carlyle backed out of the transaction at the eleventh hour, claiming that one of AGIP's oil refineries processed oil from Libya, a nation embargoed by the United States for sponsoring terrorism. Norris says that Baker's law firm, Baker Botts, had already told Carlyle there were no legal problems with owning the refinery. But Carlyle wanted out anyway, apparently preferring to distance itself from deals that were initiated by Norris. "We were very, very close to the deal," recalls Guizzetti. "Then suddenly Carlyle changed, and the reason they gave about Libya being a terrorist state was stupid. It was the departure of Steve [Norris] that killed the deal."

Norris went on to start up a series of independent investment houses on his own and met with tepid success. Many people in the private equity world say that Carlyle made it very difficult for Norris to succeed after he left. "They badmouthed him all over Europe," says one banker. "It made it impossible for him to raise money." A number of bizarre rumors had begun to crop up around the Beltway, like the one about the sauna, about Norris' relationships and spending habits. To this day, Norris is baffled by the animosity he curried while at Carlyle, and questions his actions often. "I've certainly made my share of mistakes while I was there, but if I had to do it over again, I don't think I would have changed anything," he says. He blames Carlyle, particularly Conway, for waging what he terms a "scorched earth" campaign against him after he left, sullying his name and attacking his character. What is undeniable is that Norris has been completely

written out of the firm's history. Deals that he said he did are now attributed to Rubenstein, Conway, or Carlucci. He is no longer mentioned in any of the company's literature. He is persona nongrata. It's as if he never existed. Poof.

"They had to discredit me," says Norris today, while waiting for his girlfriend at the Four Seasons in Washington, DC, the hotel chain that he'd helped the Prince invest in years earlier. "I should have been a hell of a lot smarter. But one of my biggest weaknesses is that I tend to be too trusting. I thought I had some partners around me that, though we all had different approaches, would pull together. That just didn't turn out to be the case."

With Norris out of the picture, and Baker in place, Carlyle was now looking toward its future. Baker's marquee value put the company in a position to start raising massive amounts of capital, a problem that had plagued them in the early stages. And now they would be able to take their dog-and-pony show on the road, raising international funds off the strength of Baker's name. The company now had enough heavy hitters to pry open wallets from South Korea to Saudi Arabia. While Baker was still having a little difficulty weaning himself from politics—on a fund-raising trip to Japan in 1994, Baker could not pull himself from the television set as he watched that year's election results come in—he would prove to be an invaluable addition to the firm. He would help attract money from some of the wealthiest people in the world. A trend that in turn would make Carlyle itself one of the biggest investors in the world.

9

BREAKING THE BANK

When you make $50 million, you have a different perspective on life.
—David Rubenstein, *New Republic,* October 18, 1993

Cast of Characters

George Soros	Internationally respected investor and speculator, Carlyle investor.
John Major	Former prime minister of the United Kingdom, Carlyle partner.
David Rubenstein	

Private equity firms are often judged on the amount of money they have under management. It is generally considered a measure of success, an indication of investors' trust and confidence. In this business, size matters. And though Carlyle had done some decent deals, they were not considered a major private equity player. They didn't have any funds of $1 billion or more, a basic earmark of a successful firm. In fact, their largest fund was a meager $100 million. They still struggled to raise enough capital to fund the deals they did identify, and even those were cobbled together using smoke and mirrors. They often took on too much debt when acquiring companies, and that would inevitably make exiting the investment more difficult. What they needed was more fund raising. They needed money in the bank. Enough

money that they could stop worrying about money. The kind of money that only the elite firms could raise. They were about to get it. But like Carlyle's portfolio of acquired companies, its list of investors carried conflict and controversy. Soliciting money from just about anyone who had it, the company put together some powerful and unlikely bedfellows. And the little merchant bank from Washington, DC, began to grow in both stature and intrigue.

Considering Carlyle's questionable investing record by the mid-1990s, it is truly remarkable that the firm was able to attract the type of talent it had. Midway through the 1990s, the company had yet to cash in on anything but a few defense buyouts. Carlyle was getting pigeon holed as a defense company, and fast. Business press was criticizing it for being a bunch of tax-scamming crony capitalists, trading in on their time in government, and hitting up old friends for business. They had made a little money, but they certainly weren't lighting up the scoreboard. One magazine reported that Conway's wife was pestering him about seeing some profits they could take to the supermarket. Then everything started to change.

With Baker on board, Rubenstein turned his focus to raising money. Truckloads of money. Rubenstein began work on a fund that would eventually be called Carlyle Partners II, designed to focus on aerospace, defense, healthcare, telecommunications, and insurance. The idea was to parlay the newly acquired political expertise that Carlyle had gained through the hiring of Darman and Baker, and invest in industries that are heavily dependent on federal regulation. This way, Carlyle could cash in on its ex-politicos in two ways: first, to help them raise money by giving speeches at home and abroad, packing the house with high net worth individuals; and, two, to leverage their relationships with lawmakers to gain insight on the direction of policies that affect their target industries. It was a brilliant strategy that was about to make all of them very, very rich.

Soros' Millions

The goal for the fund was $500 million, a relatively modest sum in private equity circles, but five times as much as Carlyle had ever raised. Until this time, Carlyle's strategy was to first identify a deal, then round up the investors needed to make it happen. There was often a great deal of leverage involved, and the debt loads on some of the deals caused ongoing problems for Carlyle. This time would be different. After rounding up almost $150 million from some banks, pension funds, and Richard K. Mellon & Sons (an original investor in Carlyle), the company was going after an investor that could contribute both money and fame and get them over the hump. They were going after George Soros.

The Hungarian-American Soros already had the reputation of being the most prescient and successful investor in the world. His Quantum Fund was admired around the world. His investment record was unassailable. But on September 16, 1992, he cemented his place in finance history by shorting the British pound, and nearly bringing down the British banking system. That day came to be known as Black Wednesday.

Shorting is a way of betting that a stock or currency will lose value, usually over a relatively short amount of time. The investor borrows the stock or currency, then sells it, expecting to buy it back after the value decreases, thus pocketing the difference. It's a very risky investment strategy, because should the stock or currency increase in value during that time, the short investor may be forced to buy back the stock with money they may or may not have, resulting in huge losses. People who short are universally reviled in investing circles, because they want companies and currencies to fail and thus lose value. Often times, they take an active role in making that happen, circulating rumors and various untruths that will undermine the stock. It can be a rather dirty business.

In 1992, Britain was in the midst of a tough recession, and the British pound was struggling to maintain its value against

other currencies. Then prime minister John Major had announced a comprehensive plan to restore confidence in the pound. Publicly, he called it his "over-riding objective." But Soros had other ideas.

Soros placed a $10 billion bet against the pound, enough to cause the value of the currency to bottom out on its own when the public saw that such an important and knowledgeable investor had lost confidence in the currency. In essence, Soros was betting against Major and his ability to prop up the sagging pound. It has been called the highest stakes poker game in history. Currency speculators were either to believe in Major's ability to save the pound or Soros' intent to eviscerate it. Soros won. On Black Wednesday, the pound crashed, crippling the British economy and embarrassing the prime minister. Soros made a profit of $950 million. He would later be known in England as the man who made a billion off the pound's collapse. Needless to say, George Soros wasn't exactly a popular bloke in the United Kingdom.

So when Soros agreed to become a limited partner in Carlyle's new fund exactly one year after Black Wednesday, he was bringing far more than just $100 million. He was bringing added credibility and a reputation for making gobs of money. George Soros didn't make bad investments, so the Carlyle Group must be for real. Soros was also jump starting a fund that would go on to be the most successful in Carlyle's history. It is unusual for a private equity firm to issue a press release announcing an investment into a fund. Usually contributions to private equity funds are decidedly low-key events, meant to be kept private. Most investors prefer it that way. But it's different when the investor is George Soros. Carlyle needed to capitalize on their newfound fortune. So an announcement went out hailing a new dawn at Carlyle. Rubenstein would publicly characterize the investment as "more of a partnership than just a passive relationship." Indeed, Soros helped to market the fund, and his anchor investment brought the total

money raised to half the anticipated $500 million. But as it turned out, reaching the stated goal of $500 million would not be a problem for Carlyle, now that they could throw Soros' name around at meetings.

Suddenly, raising money was surprisingly easy. Investments were pouring in from the likes of American Airlines, Gannett, Citibank, and others. By the winter of 1994, the fund had already reached $400 million, and the target was raised to $650 million. Then in the fall of 1995, the goal was again raised, this time to $750 million. The money was starting to pile up. The Carlyle Group had everyone from Soros to Colin Powell helping them out, talking to investors, and opening wallets.

In Carlyle's previous fund, Carlyle Partners I, the defense investments Carlyle had made in the late 1980s were finally starting to cash out in the mid-1990s, and the payment was handsome. The company took a $38 million investment in Vought Aircraft in 1992, turned the company around, then sold it to Northrop Grumman just two years later for $130 million. Word got around quickly that Carlyle had the best game in town. Rumors of 46 percent annual rates of return had investors salivating. Members of the bin Laden family were in for untold millions. The state of Florida was in for $200 million. And the California Public Employees' Retirement System (CalPERS) was in for $80 million.

By the time Carlyle Partners II closed in September 1996, the fund had raised more than $1.3 billion, 13 times the size of the company's first fund, and more than twice the anticipated amount. The billion dollar mark is an important right of passage for any private equity firm, and Carlyle had now reached the levels of the elite. From this massive fund, the company would spread its investments all over the defense world. Carlyle Partners II was, and still is, the company's crown jewel. Many more funds would come down the line, but none with the power, scope, and success of Carlyle Partners II.

The Rich Get Richer

The time had come to start investing the money the company had worked so hard to raise. And true to its word, Carlyle sunk the bulk of the cash into an impressive series of defense, aerospace, and security companies. Names like Aerostructures Corp., United Defense, United States Marine Repair, and U.S. Investigations Services dominated the list of investments. And most of them had one thing in common: They depended on government contracts to make a living. Carlyle Partners II would ultimately go on to become the source of massive controversy, but before that it would make a killing, returning better than 30 percent annually to its investors, and finally making Carlyle's co-founders very, very rich.

Carlyle was really starting to hit its stride in the mid-1990s, both in raising capital and cutting deals. No deal illustrates that better than Howmet, a maker of blades that go into jet engines and gas turbines. In the fall of 1995, a major French multinational corporation called Pechiney was looking to unload Howmet quickly and quietly. Part of Carlyle's strategy in identifying investments—the company was looking at more than 1,200 potential deals a year at this point, but rarely invested in more than four or five—was to avoid getting into an auction with all of the other big names in private equity, like Kohlberg Kravis & Roberts or Forstmann Little & Co. As it turned out, the big guys weren't interested anyway, because the aerospace industry was in a major slump. So Carlyle joined forces with a maker of rocket fuel named Thiokol, and each picked up half of Howmet for $100 million. The two companies leveraged the rest of the purchase, which ended up costing $750 million in total. They all agreed they had overpaid.

Carlyle then applied a formula that would result in many successes for them in the future. They structured a sweeping system of financial incentives, from the executives to the shop floor workers. Stock options for upper management, and straight

bonuses for the grunts. They taught every last employee in the company, all 10,000 of them, how to manage cash flow. They dangled a great big green carrot. And it worked. In the first two years Carlyle owned the company, sales increased by 25 percent while expenses fell consistently.

By the fall of 1997, just two years after the buyout, Carlyle had managed to pay down more than half the debt that was incurred during the buyout and was ready to take Howmet public. The initial public offering was valued at $1.5 billion. Carlyle was entitled to half of that, making their $100 million investment worth $750 million. Not bad for a two-year turnaround. The boys at Carlyle had learned much since the early days of Chi-Chi's and Caterair. Things were starting to come more easily for them.

Carlyle was on a serious roll now. They decided to hit the global scene, using the same formula they had applied domestically: hire ex-politicos to open doors and wallets. By this time the company had George Bush Sr. casually working for them on and off as a "senior advisor." (Bush and Rubenstein had become very close friends at this point.) So it wasn't difficult to hook former U.K. Prime Minister John Major, as well. Fresh off his 16 years in government, the last seven of which were as prime minister, Major was another huge score for Carlyle. He had been America's ally during the Gulf War, which put him largely in the good graces of Carlyle's Middle East investors. And Carlyle had plans to create another massive buyout fund, this time targeted at European companies. The fit was perfect, and in late 1997, John Major became a member of the Carlyle European Advisory Board—just months after he left his post as prime minister in May.

The hiring of Major set up another of Carlyle's global ironies. It was, of course, Major that fought so hard to restore the value of the pound during Britain's disastrous recession in the early 1990s. And it was Soros who had opposed him; almost single-handedly defeating Major's efforts by speculating on the pound, and bringing the British economy to its knees. Now they were partners in

their business with Carlyle. Apparently, world leaders can forgive and forget. Nothing personal. With all that behind them, it was time to party.

The company held a lavish celebration marking its tenth anniversary in the fall of 1997. Inside the Library of Congress, the capitol building visible through the windows, the Carlyle Group celebrated its success with a gala affair that included a 20-piece orchestra. The room was wall-to-wall dignitaries, world leaders, ex-presidents, and business leaders. The Carlyle gala was the place to be, the tough ticket in DC. These were good times, and the partners at Carlyle knew it. They had finally made it.

Globalization

The European fund, like Carlyle Partners II, took off. Thanks to the help of Major, European heavy hitters, like Credit Lyonnais, Commerzbank, and Credit Agricole, contributed to the fund. As did American heavies, like AIG Global Investment, AMR Investment Services, BankAmerica, and the World Bank pension fund. (Afsaneh Mashayekhi Beschloss, then treasurer and chief investment officer at the World Bank, was the woman in charge of pension fund investments. After she retired from the World Bank, having committed an undisclosed sum of money to Carlyle, she took a job with Carlyle, a trend that would be repeated through Carlyle's history. That is not to say that Carlyle promised anyone they did business with a job, but the regularity of deals that look like quid pro quo is alarming.) The money rolled in yet again, and by late summer in 1998, the company had doubled its initial goal for its second consecutive fund, closing it at $1.1 billion. It seemed as if Carlyle could do no wrong.

But they didn't stop there. Over the next two years, the company would raise funds for investments in Asia, begin marketing funds to Latin America and Russia, and start up several venture

capital funds aimed at smaller investments of up-and-coming companies. It would set up real estate funds in Europe and the United States. By the end of the decade, Carlyle stood with more than a dozen funds and close to $10 billion under management. It was officially a juggernaut, and the world was taking notice. The company was hiring politicians from all over the world to further their cause: former president of the Philippines Fidel Ramos; Prime Minister of South Korea Park Tae-joon; former SEC Chairman Arthur Levitt. And, of course, George Bush Sr.

In the way that money breeds more money, Carlyle was becoming an unstoppable force during the latter half of the 1990s. Both the money and the talent that was pouring in was building something that transcended a traditional private equity firm. In fact, it transcended traditional business. Carlyle was transforming into an entirely new kind of company, unique in both its makeup and its approach to business. With all of the politicians now on board, Carlyle was far more powerful than other investment banks. It had an enormous amount of money and clout, both of which had a certain snowball effect that led the company into uncharted waters. But there was even more good fortune ahead. Much more.

10

BUYING BUSH

The shady world of bribes, kickbacks, and improper campaign contributions.

—*Harper's Magazine,* "Notes on a Native Son," an article on the Bush campaign, February 2000

Cast of Characters

George W. Bush	President of the United States of America.
Paul Silvester	Former Connecticut State Treasurer.
Wayne Berman	Washington insider, financial backer of George W. Bush, president of Park Strategies.
Denise Nappier	Connecticut State Treasurer.
Thomas Hicks	Founder of Hicks, Muse, Tate & Furst, Texas billionaire, Bush backer.
James Baker III	

George W. Bush is a president who has long been criticized for being beholden to corporate interests. And perhaps no company holds more sway over the president than the Carlyle Group. After all, George W. Bush owes his presidency to two men: his father, who provided him the Bush surname and his legacy of success; and James Baker III, the man who first helped Bush Sr. get elected president, then fought in the trenches of the Florida recount to capture the 2000 election for his son. Both of those men work for the same company: the Carlyle Group.

George W. Bush becoming the president of the United States would turn out to be a major boon to Carlyle's business. This was an eventuality that was not lost on Carlyle's executives during the younger Bush's campaign for the presidency, and as a result, Carlyle and its partners played as large a role as anybody in securing Bush's victory in 2000. But the road to the Bush White House was fraught with land mines for Carlyle. As Bush campaigned, the press examined his and his father's relationship to Carlyle, and the result was a series of stories about dubious investments, seemingly crooked kickbacks, and near-miss scandals, any one of which, had they hit their mark, could have brought Carlyle crashing back down to earth. Instead, as it had done so many times before, Carlyle deftly traversed the tricky terrain and reached the Bush White House relatively unscathed.

A Bush Bonanza

While Carlyle had amassed a formidable employee roster by the late 1990s, it wasn't until George W. Bush's announcement of his intent to run for president in 2000 that the full potential of the Carlyle arsenal began to dawn on the rest of the world. After all, it was Carlyle that had placed young Bush on the board of Caterair when he needed to beef up his business resume (though he would later eliminate any reference to the disastrous Caterair debacle in his official bio). And it was Carlyle who had been paying the senior Bush to give speeches and meet with foreign leaders around the world on their behalf. And then there was the host of former Reagan-Bush stalwarts, like Baker, Darman, and Carlucci, now on board at Carlyle. With billions already under management, funds closing at twice their initial targets, and a growing international profile, the prospect of George W. Bush becoming president on top of all that seemed unjust. After all, how was anyone in the private equity world going to compete with them now?

But that's exactly how things were setting up for the boys at Carlyle. Not ones to leave anything to chance, Carlyle did what they could to ensure their desired outcome to the 2000 elections. The company was among the top political contributors in the defense industry in the 2000 election cycle. According to the Center for Responsive Politics, Carlyle contributed more than $427,000 to political candidates in 2000. A total of 84 percent of those contributions went to Republicans, making Carlyle the most partisan of the top 10 defense contributors. George W. Bush received more than $190,000 in campaign contributions from defense contractors in 2000, more than four times the amount Democratic presidential nominee Al Gore received.

While the tantalizing prospects of one of their own setting up shop in the White House filled their dreams, the campaign of George W. Bush cast an unwanted light on the connections that Carlyle had cultivated over the previous decade. And the resulting investigations by the press would add to the public's suspicions of the Carlyle Group.

Close Call in Connecticut

It all started off innocently enough. The news that Connecticut's former state treasurer was under investigation for investing the state's pension fund without proper due diligence barely caused a stir in New England, let alone Washington. Things like this happened all the time. And the situation in Connecticut looked relatively harmless as compared to other pension fund scandals. He probably just made a few bad investments. Didn't do his homework. Nothing to get too upset about.

But gradually the story started to take on a life of its own, and it became clear that this was not your run-of-the-mill negligence. This was something far more sinister. Over time, the

complicated web of bribes and kickbacks was uncovered, and the result was the Carlyle name getting dragged through the mud again.

After he lost his bid for reelection to the Connecticut State Treasurer's office in November 1998, but before he left office in January 1999, Paul J. Silvester was a busy man. He invested $800 million in state pension funds in a series of eleventh-hour placements during those two frenetic months. This inordinate amount of action for a lame-duck treasurer raised eyebrows at the FBI, and the Bureau began an investigation. The Bureau wanted to know where the money had been placed, and why Silvester was in such a hurry to invest it. Silvester told the press that there was nothing irregular about the investments, and the whole thing was nothing but "a politically motivated witch hunt," contrived by one of his former political rivals. Nevertheless, Silvester resigned his newly acquired position at an investment firm called Park Strategies to concentrate entirely on the investigation. His new boss at Park Strategies, Wayne Berman, told the press early on that Silvester "resigned for personal reasons." It was one of the last times Berman would talk to the press on the matter.

But the investigation turned when agents realized that at least two of the investments that Silvester had made during the period in question were placed through Park Strategies, the same firm that had hired Silvester upon his leaving the state treasury. It worked like this: Silvester landed a high-level position at Park Strategies almost immediately after placing the investments and leaving office. On the face of it, it appeared as if Silvester was securing his future by investing the money through Park Strategies, which in turn had agreed to hire him.

Incidentally, Park Strategies placed $50 million of the money that Silvester invested into an Asian buyout fund run by Washington, DC's most connected company: The Carlyle Group. By the

summer of 1999, the focus of the investigation shifted onto whether Silvester had shuttled the money through Park Strategies in return for getting a job. The fact that the money had ended up with Carlyle seemed irrelevant. But every week, media scrutiny on Wayne Berman increased. Park Strategies LLC was a consulting firm that Berman set up with former U.S. Senator Alfonse D'Amato, a Republican from New York. Berman worked in the first Bush administration's Commerce Department and was also one of the largest fund raisers to the George W. Bush campaign, having raised more than $100,000 for the cause. He was thoroughly connected in DC.

Soon, the focus of the investigation again shifted. The FBI now wanted to know if Silvester had received illegal kickbacks, either from Berman or his clients like the Carlyle Group, in exchange for his placement of the $800 million, of which $50 million went to Carlyle. Federal officials subpoenaed information from Park Strategies and Carlyle, as well as dozens of other investment firms. Homes were searched, files were confiscated, and dozens of interviews were conducted as part of the investigation. And finally, Silvester cracked. On September 23, 1999, Paul Silvester pleaded guilty to charges of corruption. Over the ensuing months, a complicated ring of kickbacks would result in fines and indictments for several of Silvester's family members, including his brother and brother-in-law. Together, the Silvester family had been accepting bribes for years, buying themselves boats and shiny new coats of paint on their houses.

Many of the documents from the case remained sealed, but the *Hartford Courant* quoted court documents that explicitly said Silvester "understood that his employment opportunity and/or substantial salary was contingent on his investing Connecticut state pension money with" a particular fund, referred to ambiguously as "Fund No. 4." The newspaper also reported that Berman had received fees, as much as $1,000,000, by virtue of Silvester's

investments with Carlyle. Berman says the number was closer to $900,000. Finder's fees are not illegal, and though unusual, they are not unheard of. The concern is they can sometimes be used illegally as quid pro quo in kickback deals.

To this day it is not clear which fund the court documents are referring to. According to Bernard Kavaler, director of communications at the Connecticut Treasury Department, the U.S. attorney's office has not named the firms involved because the case is still pending. Paul Silvester has yet to be sentenced, though he is spending his days in jail. "They used letters and numbers in the court documents," Bernard Kavaler told me in September of 2002. "They still haven't named the who's who yet." In the meantime, the public is left to speculate.

As a result of the added scrutiny, Berman suspended his fundraising activity for George W. Bush. Berman maintains his innocence on any and all accusations to this day and calls the whole mess "ancient history." He went on to tell me that "the only thing I suffered from in this was some bad publicity from a 50,000 circulation newspaper. It all just evaporated. Everything I did was aboveboard." Berman told me that after the U.S. attorney's office requested some paperwork from him, which he provided, they never again contacted him on the matter. "I was never interviewed, they never called, never sent me a letter, never sent me a birthday card. I was never questioned. It is fair to say, therefore, they didn't think I did anything wrong."

On September 30, 1999, the new treasurer in Connecticut, Denise Nappier, called for new disclosure standards for Connecticut and asked that all recipients of state investments reveal to whom they had paid finders' fees. She also announced that she would make the findings public. The idea was to make investment banks more accountable for their behavior, be it legal or illegal. Following are excerpts from the first letter from Nappier to Rubenstein:

Dear Mr. Rubenstein:

As part of an ongoing federal investigation, the United States Attorney for the District of Connecticut recently disclosed a series of improper and illegal activities engaged in by my predecessor, Paul J. Silvester.

The information detailed by the United States Attorney focused, in part, on improper use of finder's fees. While it is my understanding that use of such fees can, in certain circumstances, be a legitimate business practice, the federal investigation has raised a myriad of legal and ethical issues, including possible and probable conflicts of interest and appearances of impropriety. In our effort to comply with the spirit and letter of all Connecticut and federal laws, and consistent with my longstanding interest in public disclosure, it is necessary that we formally ask all firms and individuals doing business with the Office of the State Treasurer to disclose finder's fees or other compensation paid to anyone as a part of any transaction related to the introduction, award, or continuation of business with my Office.

Accordingly, I request that you provide, on the forms enclosed herewith, a detailed disclosure of any and all finder's fees, placement fees, consulting contracts, or other compensation currently made in connection with any transaction or ongoing arrangements related to procuring or doing business with the Office of the State Treasurer, as well as any such arrangements during the past five (5) years. As part of this disclosure, I ask that you identify the individuals or entities receiving any such compensation and the amount of each payment. In the event that your company did not pay finder's fees, placement agent fees, or furnish other compensation at any time during this period, kindly so indicate in your response.

Please forward your response on *or before October 15, 1999,* to the attention of Catherine E. LaMarr, Esq., General Counsel, Office of the State Treasurer, 55 Elm Street, Hartford, Connecticut 06106-1773.

> My office values our relationships with each of our vendors, and we appreciate your prompt and careful attention to this matter.
>
> Sincerely,
>
> Denise L. Nappier
> State Treasurer

Hundreds of funds, fearful of losing Connecticut's business, complied with Nappier's requests immediately. But Carlyle's disclosure for its Asia fund was unacceptable by Nappier's standards, and the company outright declined to submit a report on its European fund, which Silvester had also invested in during his tenure as treasurer.

Nappier, her patience wearing thin, then sent another letter to Carlyle, more than a month after the first, threatening to cease all business dealings with the firm if they refused to disclose their finder's fees.

> Dear Mr. Rubenstein:
>
> By letter dated September 30, 1999, I requested that your company voluntarily disclose all compensation paid or promised in connection with any transaction or ongoing arrangements related to procuring or doing business with the Office of the State Treasurer since January 1, 1995. To date, we have not received a response to this request.
>
> Disclosure of this information is the policy of this administration. Failure to comply will certainly jeopardize your company's current business relationship with the Office of the State Treasurer, as well as any prospects for future business.
>
> In the event that we do not receive a full and complete response by the close of business on November 15, we will work with Connecticut's attorney general to pursue every legal

> recourse available to suspend or end our business relationship with your firm.
>
> Sincerely,
>
> Denise L. Nappier
> State Treasurer

More than a month had passed since Nappier's original request and still nothing from Carlyle about their European fund. The *Wall Street Journal* reported on September 29 that Nappier was already starting the process of unwinding or canceling $561 million in investments made under her corrupt predecessor, including money invested with Carlyle. The clock was ticking, and there was $150 million at stake for Carlyle. It appeared as if Carlyle did not want the public to know something. Why else risk losing the money?

Finally, Carlyle came clean, delivering a full report to Nappier and the state of Connecticut. The company said that it had paid Wayne Berman a $1 million finder's fee for a $100 million placement from the Connecticut State Pension Fund into the Carlyle European Partners fund. In addition, the Associated Press reported in January 2000 that the Connecticut State Treasurer's office had paid a whopping $2,971,945 fee to Carlyle Europe Partners, the nature of which remains unclear to this day.

More Money, More Problems

The Silvester case was a close call for Carlyle, and the company's profile was becoming a little too pronounced for Rubenstein and company. It wasn't just the Silvester scandal that was turning up the heat however. George W. Bush's campaign for president had the press in overdrive, digging voraciously into the younger Bush's past, looking for examples of corporate cronyism, nepotism, shady

dealings—anything that would sell newspapers. Democrats were eager to portray Bush as the "corporate candidate," or "Daddy's little boy." With Carlyle, both the media and Bush's opposition thought they had found something. They were asking copious numbers of questions. Who was this secretive company that Bush Sr. was working for? Aren't there some conflicts of interest inherent in this arrangement? Just how much business has George W. Bush done with the Carlyle group?

As it turned out, the Silvester affair led reporters to another questionable association between George W. Bush and big business, and once again Carlyle found itself running for cover. Enterprising young reporters were more interested in establishing the elusive connection between Berman's dealings with Silvester, and his generous campaign contributions to Bush. It was a connection they failed to establish. But the hunt for questionable campaign contributions led them to another financial supporter of Bush: Tom Hicks.

In February 2000, *Harper's Magazine* wrote an epic piece laying out the George W. Bush's business history in excruciating detail. It scrutinized the relationship between Bush and Thomas O. Hicks, a self-made Texas millionaire whose company, Hicks, Muse, Tate & Furst, was among Carlyle's biggest competitors in the private equity business. Hicks, a dedicated Texas Longhorns fan, had been up for a seat on the University of Texas' board of regents when George W. became governor in 1994. With the transition in power in Austin threatening his promised seat, Hicks provided Bush with a $25,000 campaign contribution, after he'd already won the election. Some say contributing to a campaign after the campaign is already over is another way of giving free money to a politician in return for a favor. And Bush did push through Hicks' coveted appointment to the board. Favor granted?

Through his new position, Hicks encouraged the University to more aggressively invest its $13 billion in financial assets, which includes endowments, donations, alumni contributions, and so

on. Frustrated with the conservative strategy of years past, Hicks felt the University was leaving money on the table and had big ideas on how to change that. The answer was the P-word: *privatization*. Hicks fought hard to create a private company through which the assets of the University of Texas would be managed. It was a bold strategy, but one that fit with the larger trend toward privatization sweeping the nation.

By 1996, University of Texas Investment Management Company (UTIMCO) was born. Tom Hicks was quite pleased with the creation of UTIMCO, but the public and press were a bit miffed. As it turned out, the nonprofit company no longer had to divulge details on the investments of the University's money to the public; due diligence reports were not made available to the press. No one knew what the University's money was being spent on anymore. It was an untenable situation for the University's investors. But it went on for years.

Over time, the press and political action committees forced UTIMCO to open up its books, for fear that investments were being made based on political leanings and personal relationships. They found what they had suspected. Among the reams of Republican-friendly recipients of investments was, perhaps not surprisingly, the Carlyle Group. Weeks after Bush became governor in 1994, the University's board of regents placed $10 million into Carlyle Partners II, the fund that holds the bulk of the company's defense investments, as well as the lion's share of its controversy. It was a stunning example of how big business and politics are never far apart. Tom Hicks, an appointee of George W. Bush, had helped place $10 million of the University's money with a firm that not only had employed George W. a year earlier (via Caterair), but at the time was also considering employing George H. W. Bush. It was classic Carlyle, commingling business and politics to the point that the lines are blurred.

Hicks told *Harper's* that he didn't know of the relationships within the Carlyle Group when he made the investment. In fact,

he went on to say that he suspected internal problems within the firm (most likely the ongoing feud between Norris and Conway) and had reservations about the investment from the onset. Which begs the question: Why invest in them at all? Especially in light of the fact that Carlyle is the supposed competition to Hicks, Muse, Tate & Furst. Tom Hicks, like so many others that do business with Carlyle, declined to be interviewed for this book.

It appears that UTIMCO's investments were at least partially politically motivated, rather than purely financially motivated. And that is the power of Carlyle. When an investor commits capital to a Carlyle fund, are they making a sound financial investment or a strategic political contribution? The inherent confusion works to Carlyle advantage.

Baker's Battle

Many political experts thought that the revelations about Berman and Hicks would do serious damage to George W. Bush's presidential campaign. It's impossible to know just how much of an effect the news had on voters. But however great the damage was, it paled in comparison to the value of the money that Berman and Hicks would contribute to Bush's campaign over time. Miraculously, Carlyle managed to tiptoe through the landmines relatively unscathed, aside from some unwanted attention. However, speculation over Carlyle's political leanings and what the company had or had not done to further George W. Bush's political aspirations became a moot point when James Baker got a call from Bush's campaign manager the day after the 2000 presidential elections: He was needed in Florida.

From the moment he was called into duty on November 8, 2000, until the day that Gore conceded the election on December 13, Baker dedicated himself tirelessly to winning the Florida vote for Bush. Having sat out the previous two campaigns, including

George W. Bush's, Baker jumped into the fray with both feet. It was obvious he hadn't lost a step.

After taking a plea for help from Bush's campaign manager, Baker flew to Florida immediately to assess the situation. So many things were riding on this vote. Baker, already as partisan a politician as there is, had many reasons to want the younger Bush in office. For one, there was the eight long years he had spent in exile since the Clinton administration took office. The hatred that Republican stalwarts harbored for Clinton and Gore cannot be overstated. Then, there was Baker's fierce loyalty to his close friends in the Bush family. And finally, the new life that Baker had carved out for himself since leaving the public's eye—that of a lawyer at Baker Botts and a globe-trotting deal maker for Carlyle Group—would benefit substantially if a close family friend were in office. The motivation was stacked.

Baker brought the same tenacity into Florida that he brought to his previous five Republican presidential campaigns. He relentlessly went to work attacking the Gore camp's motto, repeated ad nausea during the fight for Florida, of "Count all the votes." Baker was quoted in Jeffrey Toobin's definitive book on the subject, *Too Close to Call: The Thirty-Six Day Battle to Decide the 2000 Election,* as saying, "We need a PR strategy, we're getting killed on 'Count all the votes.' Who the hell could be against that?" Republicans, that's who. Baker wanted to limit the amount of votes that were recounted, knowing that with Bush already in the lead, the fewer votes that are recounted, the better Bush's chances of winning. Recounting them all could only lead to bad things.

But the Gore camp decided not to get too greedy by asking for a full recount throughout the state. Instead, they asked for a selective recount, only in the most controversial counties. Gore's people thought the tactic would be seen by the public as generous and fair, but they forgot that the campaigning was over, and the public's impression no longer mattered.

Baker turned the tables on Gore, filing a federal lawsuit claiming that the Gore camp's selective recount request only included counties in which Gore was likely to pick up votes. Many of the lawyers at work with Baker felt filing a lawsuit would look bad, and ultimately be a losing strategy. But Baker knew better. It was a litigious long shot, and ironically opposed their real goals. The fact of the matter was that the Baker/Bush camp had no intention of recounting all of the votes. They didn't want any of the votes recounted. As far as they were concerned, they had already won the election.

Baker carried out the operation in Florida with military precision. He spoke to George W. Bush often, sometimes four times a day. Though Baker kept Bush informed, he was in no way taking orders from the much younger presidential candidate. Baker was in complete command, calling all the shots. He managed to somehow sway the opinion of the court and Florida lawmakers against a recount, painting Gore as a sore loser, desperate to gain an edge. He held press conferences, claiming to be acting to "preserve the integrity and the consistency and the equality and the finality of the most important civic action that Americans take: their votes in an election for the president of the United States."

Over time, Baker developed an overused mantra of his own: The vote in Florida was counted and recounted, referring to the automatic recount of machine ballots. This was a claim, which Toobin points out, was entirely untrue. The automatic recounts that took place in Florida simply rechecked the totals that machines had spit out. It did not put the ballots through the machines again, the true meaning of a recount. Eighteen counties failed to properly recount their votes, accounting for more than a quarter of the total votes cast. Yet Baker managed to make Gore look like a fool for asking for "third" and "fourth" recounts. It was a brilliant strategy. And it worked.

The public relations battle in hand, Baker turned his attention to the legal arguments. The Gore camp never had a chance. Baker assembled an army of high-powered lawyers and political operatives, spread them around the state and country, and summarily eviscerated the Gore camp, which was led by Warren Christopher, no slouch in his own right. It was Baker at his very best: relentless, merciless, and victorious. On December 13, Gore conceded and George W. Bush became the forty-third president of the United States.

So much of what the Carlyle Group had done to this point in their history was setting them up for this moment: the defense investments, the extensive interests in the Middle East, the Republican administration in exile. Though the company would lose some of their most useful advisors and friends to the Bush White House staff, like Colin Powell, who became secretary of state, and Donald Rumsfeld, who became secretary of defense, they knew their buddies would not be far away. In fact, they would be right down the street. And even more useful than ever.

11

FAMILY BUSINESS

To this day we don't understand why [George H. W. Bush] hasn't resigned. It's causing a scandal.

—Tom Fitton, Judicial Watch,
in a phone interview, November 2001

Cast of Characters

William Kennard	Former chairman of the Federal Communications Commission (FCC), Carlyle director.
Frank Yeary	Former investment banker at Salomon Smith Barney, Carlyle director.
Arthur Levitt	Former chairman of the Securities and Exchange Commission (SEC), Carlyle advisor.
George Herbert Walker Bush	Former president of the United States of America, Carlyle advisor.
Park Tae-joon	Former prime minister of South Korea, Carlyle advisor.
Michael Kim	Son-in-law of Park Tae-joon, Carlyle managing director.
Crown Prince Abdullah	Heir to the Saudi Arabian throne.
Tom Fitton	President, Judicial Watch.

Merriam Webster's Dictionary defines *nepotism* as a noun, meaning favoritism based on kinship. It is a simple definition, inherently neutral, and easy to understand. After all, isn't it natural to favor your own family members over strangers? It seems harmless enough. But when applied to international politics, it could not

be more inappropriate. Our world leaders have a responsibility to act on behalf of the people they represent. Many of them take an oath to that effect. So when a politician, particularly the president of the United States, demonstrates nepotism in his actions, it is cause for serious and immediate alarm. George Herbert Walker Bush and his son George W. Bush have repeatedly and flagrantly crossed this border of impropriety since the younger Bush became president in 2001. And the company creating this ongoing breach of the public's trust is the Carlyle Group.

Money: A Bi-Partisan Goal

The ascension of George W. Bush to the presidency wasn't all good for the Carlyle Group. It was true that the new president had close ties to the company and would be in a position to send all kinds of business their way. It could even be said that the new president might be inclined, or at least not disinclined, to push policies and projects that might fatten his father's, and in a less direct way his own, bank accounts. But along with those newfound advantages for Carlyle came the continued, and at times increased, scrutiny of its behavior; fevered charges of cronyism; and the occasional accusation that the company was not a private equity firm at all, but rather a shadow government pulling the strings in Washington. Some of these concerns are more legitimate than others, but there was another more immediate issue: Who were they going to hire now that all the Republicans were going back to work?

Carlyle had been cultivating an unseemly reputation as a Republican boys club, whose membership privileges included the thrill of deal making on a global scale and a hefty paycheck at the end of the month. Indeed, it was difficult to spot any Democrats on the employee roster aside from Rubenstein himself, and he was 20 years removed from service by this time. But as always,

Carlyle already had a plan. It was time once again to pick over the bones of an outgoing administration. And this time, they were looking to harvest a host of Democrats.

In the spring of 2001, just a few months after Clinton had cleared out his desk, Carlyle snatched up both outgoing Federal Communications Commission (FCC) chairman William Kennard and outgoing Securities and Exchange Commission (SEC) chairman Arthur Levitt. The announcements of their hirings were less than a week apart. Both men are loyal to traditional democratic doctrine. Levitt has long been known for his concern for the individual investor, fighting to defend the little guys from the scourge of corporate greed. In one master stroke, indeed in one week, the Carlyle Group went from being a dark and mysterious GOP lair to a bright and open bipartisan buyout firm with a heart. It was Rubenstein at his best, fully aware of public opinion, and ready to make whatever changes were needed. Incidentally, the company had also picked up two of the best minds in the telecommunications and securities businesses.

But like most of Carlyle's high-profile hires, it seems that Kennard and Levitt did not come without baggage. Kennard in particular had the apparent stink of a quid pro quo deal.

Over the course of 2000, SBC Communications, the parent company of the Baby Bell Southwestern Bell, was pursuing two major agendas simultaneously. On one hand, SBC was eager to buy into the Saudi Telecommunications Company (STC), as the Saudi Arabian Kingdom took the state-owned and run telephone monopoly private. In so doing, the company had contracted Carlyle to help them, because, as one European investor noted, "Carlyle had Saudi Arabia completely sown up. They controlled the deal flow in and out."

Two years earlier, Carlyle had hired Frank Yeary, former head of the media and telecommunications investment group at Salomon Smith Barney. With Salomon, Yeary had helped SBC grow from a thriving regional telephone company into the second

largest telecommunications firm in the country by acquiring Ameritech and Pacific Telesis. Then in 1998, he had helped Carlyle and a partner buy some cable properties in Virginia and Maryland from SBC for $250 million, then turn around and sell them six months later to Comcast for $735 million. He was a legend in telecom. And he was very close to the folks at SBC. Carlyle was in the perfect position to facilitate the deal in Saudi Arabia, which they did, extremely quietly, in August 2000. The deal was so secretive, it was near miraculous that anybody got wind of it at all. But an Arabic daily called *Asharq al-Awsat* reported that the Saudi government had chosen SBC Communications to buy between 20 percent and 40 percent in the Saudi Telecommunications Company, which had an estimated value of $12 billion at the time. The deal was termed a "strategic partnership." Any number of telecom companies would have wanted in on it, but with Carlyle on its side, SBC never had any real competition.

At the same time, SBC was chaffing under newly established restrictions on telecommunications companies at home in the United States. Under the Telecommunications Act of 1996, regional bell operation companies, or Baby Bells, had to make their local lines available to the national long distance companies before they would be able to enter the long distance market themselves. Baby Bells, by nature of the telecommunications structure in the United States, had been government sanctioned regional monopolies since Ma Bell was broken up. Each Baby Bell owned and operated all of the local telephone lines for a given geographic area. Like Bell Atlantic in the Northeast, Pacific Bell in California, or Southwestern Bell in Texas. But the Telecommunications Act of 1996 was supposed to change all of that, opening up each region to competition. The tricky part was ensuring the Baby Bells would allow new competitors in to use their lines, thereby taking customers away. A bureaucratic nightmare of line request forms, fees, and fines for noncompliance emerged. Not surprisingly, new competitors had an impossible time securing lines from

the Baby Bells, who protected their turf with arrogance and defiance of the new law. It was a mess.

Baby Bells, like SBC, abused the spirit of the Telecommunications Act of 1996 repeatedly. When competitive local carriers requested lines for a new customer, the Baby Bells would drag their feet, with little or no incentive to help a new competitor steal their customers. The fines for this anticompetitive behavior, levied by the FCC, were nominal and harmlessly factored in as a cost of doing business by the Baby Bells. Many of the would-be competitors in local markets dried up and died waiting for lines they knew they would never get from the likes of SBC. SBC was among the biggest offenders, drawing millions in fines and testing the patience of regulators and potential competitors alike.

That's why jaws dropped when SBC filed an application to begin delivering long-distance service in Texas at the end of 1999. Competitors that had been trying to get a fair shake in Texas, waiting in vain to gain access to SBCs local lines, couldn't believe it. The law clearly stated that a Baby Bell must open its local lines up to competition before it would be allowed to enter the long distance markets. SBC had not done that yet. So the U.S. Department of Justice recommended in February of 2000 that the application be rejected on the basis that SBC had not sufficiently opened up its network to competitors. But the Department of Justice (DOJ) doesn't get the final say in the matter. The FCC, chaired by William Kennard, does.

SBC voluntarily withdrew the application, and reapplied a few months later. After being embarrassed by the original rejection, the company pointed to the recommendation of the Texas Public Utilities Commission (TPUC) to approve the application, which the DOJ had summarily dismissed. The TPUC, happens to be chock full of Bush appointees, and SBC was one of the largest single corporate contributors to Bush's presidential campaign. "What this sounds like is, [the DOJ] is telling the Texas state commission it doesn't know what it's doing," said

Michael Balhoff, managing director at Legg Mason, in an interview with the *Houston Chronicle*.

To the shock and dismay of many, SBC's application was ultimately approved by William Kennard and the FCC in the summer of 2000, and SBC was free to deal long distance in Texas. And in January 2001, the FCC approved SBC's application to offer long distance in Oklahoma and Kansas as well, making it the first Baby Bell company to offer interstate service since the breakup of Ma Bell. The approval was handed down on Kennard's last day as FCC chairman. Less then two months later, Kennard was working alongside Frank Yeary and the boys at Carlyle. It was all sounding awfully familiar.

The hiring of William Kennard brought with it the same appearance of impropriety that the hiring of Frank Carlucci brought. It looked quite a bit like the hiring of Paul Silvester at Park Strategies after he left the office of the treasury of Connecticut, and that of Afsaneh Mashayekhi Beschloss after she left her post at the World Bank. Here were men and women that made industry-altering decisions while in powerful positions and public office, then put themselves in a position to profit from those decisions months after they left their posts. Did Kennard act with foreknowledge of his employment with Carlyle? And what happened to his "cooling off" period? Kennard was on fire when he accepted a job at Carlyle. Only William Kennard, and maybe a few folks at Carlyle, know the answers to these questions. Perhaps that's why they all declined to be interviewed for this book. Regardless, while the Kennard situation smells bad, there was, and still is, another problem that Carlyle has on its hands that has a much mightier stink.

That ex-presidents cash in on their celebrity after their careers as public servants is understood. Most erstwhile chiefs end up on the public speaking circuit, pulling down $100,000 a speech. Many set up charity organizations, dabble in the stock market, or play a lot of golf. But never has an ex-president

had the opportunities that George H. W. Bush has, doing business with heavily regulated industries, subject to the whims of the country's commander-in-chief, who also happens to be his son. And we may never see such an extraordinary arrangement again.

Papa's Got a Brand New Gig

After George W. Bush's swearing in, the national media immediately picked up Carlyle's scent again. Though the press missed the ironies and improprieties of Levitt and Kennard, they seized on the mother of all impropriety: The Bush family stood to gain financially from policy decisions George W. made while in office. The *New York Times* finally got in on the game, writing a revealing article in March 2001, detailing the relationships between the current administration and the Carlyle Group. It was the first most people had ever heard of this company, and it scared the pants off of them.

In the article, Charles Lewis, the executive director of the Center for Public Integrity is quoted as saying:

> Carlyle is as deeply wired into the current administration as they can possibly be. George H. W. Bush is getting money from private interests that have business before the government, while his son is president. And, in a really peculiar way, George W. Bush could, some day, benefit financially from his own administration's decisions, through his father's investments. The average American doesn't know that and, to me, that's a jaw-dropper.

As a member of their Asian advisory board, Bush Sr. was visiting the Middle East, and in particular, Saudi Arabia, on behalf of the Carlyle Group. Photos taken of a meeting between Bush Sr.

and King Fahd started popping up all over the Internet. A natural confusion arose over the nature of Bush's visits to foreign dignitaries. Were the trips a form of commercial diplomacy? Were they social visits? Was the former president representing U.S. interests? Or was he just there on behalf of a moneymaking behemoth by the name of the Carlyle Group? The same questions arose in the United Kingdom over the actions of John Major, who accompanied Bush on the trips to Saudi Arabia.

Of greater concern was that Major and Bush Sr. were meeting with less savory characters than the royal family. They had been to see the bin Laden family, the wealthy relatives of a known terrorist (by this time Osama bin Laden was unambiguously viewed as a terrorist threat to the United States, and estranged from his family). It wasn't clear what either of the former world leaders were up to. And it was this confusion, on the part of both the public and foreign world leaders, that played to Carlyle's advantage. Carlyle repeatedly reaped the benefit of blurred boundaries, with foreign business owners and world leaders not knowing whether Bush Sr. represents American political interests or Carlyle's financial interests. That was, and still is, a very powerful tool for Carlyle. But while everyone was waiting for a conflict of interest to arise in the elder Bush's business with Saudi Arabia—as indeed it would later—the real controversy was happening half a world away, in the tiny peninsula off the Eastern coast of Asia: Korea.

Sowing Carlyle's Seeds in Korea

On May 27, 1999, former president George H. W. Bush touched down in Seoul, South Korea, for a whirlwind business trip. His visit was celebrated in Seoul, with newspapers hailing his arrival, excited about the possibility of American investment in Korea in the wake of the Asian economic crisis of 1998. He met with South

Korea's Prime Minister Kim Jong-pil, and president of the United Liberal Democrats party Park Tae-joon, a major political figure in South Korea who had been advising Carlyle since 1998. He also met with the chairman of South Korea's Financial Supervisory Commission, Lee Hun-jai, chairman of SK Telecom Choi Tae-won, and the president of a financially ailing Asian conglomerate called Halla. Again, it was classic Carlyle: a measured blend of business and politics that sufficiently blurred the boundaries between the two.

Carlyle's spokespeople, when questioned by the press about the impropriety of the senior Bush working for a defense contractor while his son is president, often retort by explaining that all the senior Bush does for them is make speeches about world events. They say his job is to pack the house, get the crowd excited, then step aside while Rubenstein pries open their wallets. But this trip to South Korea was much more than that. Bush Sr. wasn't just giving speeches to rooms full of investors; he was doing business, one on one, with CEOs and politicians. These were not motivational talks about global politics. This was business. And he was good at it.

Carlyle was really starting to get busy in South Korea now. That same spring, the company hired Michael Kim, a Harvard-educated native Korean, to open its brand new Seoul offices. Kim is the son-in-law of aforementioned Park Tae-joon. Carlyle and nepotism seemed to go hand in hand.

Immediately following Bush's visit, Korean newspapers lauded an announced $1 billion investment in the country by Carlyle, including a buyout of a division of Mando Machinery, a South Korean industrial firm, owned by Halla, the same company Bush Sr. had visited weeks earlier. Bush had been busy, and apparently, successful on his quick two-day trip to South Korea. Carlyle was in business on the peninsula.

Bush went on to tour Thailand, with former prime minister and Carlyle advisor Anan Panyarachun, spreading more of the

good news that money from America was coming. But back in Korea, Michael Kim was working to put together another massive deal. This time Carlyle was looking to buy one of the few healthy banks left in Korea, KorAm Bank. Korea, like the rest of Asia, had suffered terribly from the economic crisis that swept through the continent in the late 1990s. Many of the country's banks had faltered and collapsed. But KorAm was an exception. It had taken some hits, like all businesses in Korea, but had remained solvent. The Korean government had a vested interest in keeping the firm in Korean investors' hands. But Carlyle had other ideas.

Carlyle gained approval for the buyout by the KorAm board, thanks to its high-powered connections with Park Tae-joon, who became prime minister of South Korea in January 2000 and lobbied on Carlyle's behalf. But when Park resigned just four months after taking office, amid allegations of corruption, Carlyle had lost its regulatory advantage. It was going to be difficult to get the government to approve the deal without Park Tae-joon's involvement. So the firm then struggled to get the deal, which was to be for a 40 percent stake in the bank, approved by Seoul's Financial Supervisory Commission, the chairman of which Bush had met with a year prior. Carlyle was slipping, losing their political edge because of the unexpected and unseemly departure of Park Tae-joon from politics. They were losing the deal.

But after some months in self-imposed exile, Park Tae-joon, still a popular figure in Korea despite the allegations of corruption against him, came through in the end, rising from the ashes and lobbying the key government officials to allow the deal to happen, according to press accounts of the deal. By the fall of 2000, Carlyle had won, snagging 40.7 percent of the bank for $450 million. Between Bush Sr. and Park Tae-joon, Carlyle had made all the right moves to get their business in Korea humming. After another purchase of a small telecommunications carrier called Mercury Telecommunications, Carlyle had invested close to a billion

dollars into Korea's recovering economy. It was the best financial news Korea had seen in years, and it was largely Carlyle's doing. But the mirth would soon come to an abrupt halt.

A Foreign Policy Flop

When George W. Bush was sworn in to office in January 2001, everything changed suddenly and dramatically. One of the first things that young Bush did as president was call off the missile control talks that the Clinton administration had been conducting with North Korea for years. Bush revealed open hostility toward North Korea, calling it a rogue state that cannot be trusted. It was a stunning reversal of American policy, which heretofore had been to use diplomacy in mitigating North Korea's military aggression toward South Korea. And it was coming from a man that had virtually no experience in foreign affairs. The nation watched in disbelief.

Not surprisingly, the backlash from Bush's brash actions was felt far and wide. North Korea accused the United States of planting a "time bomb" in the midst of their fragile negotiations with South Korea. The South Korean government received Bush's actions as a rebuff to their safety, knowing that North Korea would be more inclined to attack without Washington's involvement. Kim Dae-jung, South Korea's president, was forced to turn to the European Union for help in filling the sudden gap the United States had created in the peace process between North and South Korea. He was also getting lambasted at home for not being on top of the situation in Washington.

Bush had made the South Koreans look bad, and undermined their safety, all with one fell swoop. Analysts speculated that Bush was motivated by his desire to create a national missile defense system, part of his campaign platform. If North Korea had no missiles to defend against, the thinking went, Bush's need for

a missile defense system would evaporate. As absurd as it sounds, peace between North and South Korea, and between North Korea and the United States, did not further his broader agenda in the White House. Regardless of his rationale, he had created an international crisis on just his second month on the job.

This also threatened Carlyle's extensive investments in South Korea, which would plummet in value as instability in the region increased. The threat of war always sends local economies into a tailspin, much like America's economy since September 11. And Carlyle could kiss regulatory approval for future deals goodbye, with South Korean officials feeling slighted by the United States, and particularly George W. Bush. At first it seemed as if this was a rare case in which being associated with the Bushes was not going to work to the benefit of Carlyle. But that would not prove to be the case.

Adding to the disarray George W.'s stance toward North Korea was causing, the unionists at KorAm bank were starting to rebel against their new American owners, accusing Carlyle of being nothing more than a speculative investor that had already broken its promise not to intervene with management. Employee representatives at the company believed that Carlyle intended to restructure the company, probably threatening jobs. And the union was rallying against Carlyle. The situation was dire. Carlyle had just ploughed nearly $1 billion into South Korea, and the man they all thought would be so good for business, George W. Bush, was on the verge of screwing it all up. Something had to be done.

On June 6, Bush reversed course. In a statement, the president announced plans to resume negotiations with North Korea, essentially picking up where the Clinton administration had left off. Among the issues that the new administration would work on with North Korea was improving relations between North and South Korea. The sigh of relief could be heard around the world, and especially from Carlyle's offices on Pennsylvania Avenue

and in downtown Seoul. Just like that, the situation was all better. But what could have created the sudden change of heart?

On June 10, 2001, just a few days after the welcome announcement by President Bush, the *New York Times* reported that the senior Bush had forcefully argued for his son to reopen negotiations with North Korea shortly before President Bush did just that. The article opened:

> In an effort to influence one of his son's most crucial foreign policy decisions, former President George Bush sent to the president through his aides a memo forcefully arguing the need to reopen negotiations with North Korea, according to people who have seen the document.

It was the first time that anyone had tangibly seen the influence of the father on the son. According to the article, Bush Sr. felt that his son was being unduly influenced by the Pentagon, and that he should adopt a more moderate stance toward the Korean peninsula. He also spelled out that the hard-line policy toward North Korea was undermining the government in South Korea, thereby hurting U.S. interests in North Asia.

White House spokesman Ari Fleischer confirmed the report in the *Times,* and told the press that the argument for reopening negotiations came originally from Donald Gregg, former ambassador to South Korea under the first Bush administration. Fleischer said that Gregg had sent a memo to the senior Bush, who then sent the memo to national security advisor Condoleeza Rice, who then passed along "the thoughts in the note" to the president. It was a way of watering down the connection between George W. Bush and his father, even though it has been widely reported that the two speak regularly. Nobody in the White House wanted the press to get the impression that senior Bush was directly influencing the president. That's probably why Fleischer's accounting of the events made so little sense. Why Bush Sr. would have to go through Rice

to relay crucial information on foreign policy to his son, when he talks to him twice a week on the telephone, is anyone's guess.

Bush Sr. went on to do even more damage control, recording reassuring remarks on U.S. policy to be distributed among participants in a crucial meeting between South Korean President Kim Dae-jung and North Korea's leader, Kim Jong-il, on Cheju Island. It seemed the former president was everywhere at once, acting as counsel to his son, ambassador to Korea, and businessman for Carlyle. For a man that had supposedly retired from politics, Bush Sr. was awfully busy.

Bush of Arabia

The folks at Carlyle refuse to talk about how ex-president Bush is compensated for his work on their behalf. Former employees, however, say that he is invested in the funds that he helps raise and place. If that is the case, the senior Bush's involvement in foreign policy regarding South Korea is a clear conflict of interest. He stands to gain financially from decisions that he is urging his son to make. It doesn't get any more egregious than that. But the press missed the connection at the time. Indeed it was a difficult connection to make, given that Bush Sr.'s trips to Korea and his work on behalf of Carlyle was kept very quiet. Then another story hit the front pages. Bush Sr. was at it again.

This time the *New York Times* reported that in July 2001, just months after he had advised his son on North Korea, the elder Bush had placed a call to Crown Prince Abdullah of Saudi Arabia on behalf of his son, to reassure Saudi Arabia's leadership that his son's "heart is in the right place," when it comes to Middle East policy. The call was necessitated by the younger Bush, who had upset the Arabs with his one-sided approach to the Israeli-Palestinian conflict. And Daddy was again there to bail him out.

The report said "former President Bush said that his son's 'heart is in the right place' and that his son was 'going to do the right thing,' a Middle East diplomat said. A senior administration official said that the phone call, warm and familiar in tone, was designed to encourage Abdullah to think of the new president as having a grasp of the Middle East similar to that of his father. According to one of the accounts, President Bush was in the room when his father made the call."

The news was stunning, and it undermined the credibility of George W. Bush on foreign policy. Who was making the decisions in the White House? Why didn't Bush Senior run for president instead? But more than that, the news of Bush Sr.'s continued involvement in foreign policy was undermining the credibility of both Bushes ability to keep politics and family business apart. Like the situation on Korea, Carlyle's extensive business interests in Saudi Arabia and throughout the Middle East, were in grave danger if the younger Bush kept pissing off the royal family. So the Senior Bush needed to step in and preserve the relationship once again. It was testament to the sway ex-president Bush still held over foreign affairs. And it didn't look good.

The reports of Bush Sr.'s actions sent the Washington, DC–based public advocacy groups into a tizzy. Tom Fitton, general counsel of Judicial Watch, a conservative watchdog group in the Beltway, is beside himself to this day. "It screamed conflict of interest," he says. "We asked publicly that the senior Bush should step down. To this day we don't understand why he hasn't resigned. It's causing a scandal."

That Judicial Watch has called on Bush Sr. to resign from Carlyle is more telling than you might think. This is not your average, ultraliberal watchdog organization. Judicial Watch is a public interest group that was conceived during the Clinton administration as a way to monitor activities that diminish the public's trust in government. It is an extremely conservative group, designed originally to bring down a Democratic president that the group

felt was corrupt. "The Clinton administration was the most corrupt in history," says Fitton. "He was a rapist who took money from the Chinese. But he's lowered the bar so far that there is an acceptance of this everyday type of corruption." Other watchdog groups had been howling at Carlyle's antics for years, but when Judicial Watch, which had a reputation as a Republican-friendly group, could no longer look the other way, Carlyle had to take notice. "We're a conservative group, but we're not Republican. The Carlyle Group has been very upset with us, but this is an extraordinary company, very unique," says Fitton. "They hire these people, and I don't think they hire them for their good looks. I'm sure it smarts for them to know that we have raised ethical concerns on the part of the president's father."

Fitton points out that not only has the former president been making investments for Carlyle and weighing in on foreign policy that directly affects those investments, but he is also privy to CIA briefings whenever he sees fit, referred to internally at the CIA as "President's daddy's daily briefing," a right that all ex-presidents maintain. And according to press reports, Bush Sr. still requests and receives CIA briefings often. Despite being 10 years removed from his presidency, Bush Sr. remains an extremely powerful and influential man. Imagine what a global enterprise, that does large amounts of business with arms contractors and foreign governments, could do with weekly CIA briefings. Or a company with the ability to influence foreign governments and global events. A company like that would have access information that would set it apart from any company to come before it. A company like that could be very successful. A company like that might look a lot like Carlyle.

12

BIG GUNS

Killing this killing machine won't be easy.
—*Wall Street Journal,* "Heavy Metal," May 5, 2001

Cast of Characters

General Shinseki	U.S. Army chief of staff.
George W. Bush	President of the United States of America.
Donald Rumsfeld	Secretary of defense.
Andrew Krepinevich	Executive director of the Center for Strategic and Budgetary Assessments, opponent of Crusader.
Milo Djukanovic	President of Montenegro.
Colin Powell	Secretary of state.
Frank Finelli	Retired Army colonel.
Frank Carlucci	

The part of Carlyle's business that has naturally attracted controversy over the years is its defense business. It makes sense. War, after all, is inherently controversial. It usually involves heated passions, covert strategy, and death on a large scale. So it's not entirely surprising that ordinary American citizens felt outrage at Carlyle's commingling of ex-politicos, guns, and money. The idealist in all of us wants to believe that war is an awful, but necessary, part of the human condition. We want to think that our nations enter reluctantly into battle, always as a last resort, after all other means of resolving conflict are exhausted. And we never want to believe that war, and the destruction and horror that accompany

it, could ever be seen as a business. But it is true. At least the people profiting from these wars aren't the same elected officials that have led us into battle in the past and still hold sway over current decision makers in the White House and the Pentagon, right? Wrong.

Crusader's Crusade

By 2001, the world outside of Washington, DC, was becoming dimly aware of the Carlyle Group. People would chat about them casually at cocktail parties, noting the intimidating employee roster and joking about shadow governments and X-files episodes. But it was all speculation at that point. No one in the media had put together the apparent conflicts of interests the Bushes had cultivated in Korea and Saudi Arabia. Yet people had a vague and nagging notion that there was something wrong with the way Carlyle was conducting its business. They were just having trouble putting a name to it. Everyone was looking for the proverbial smoking gun. Little did they know that it was literally a smoking gun they would find.

The saga began in the summer of 1997, when Carlyle was raising money like mad, hiring world leaders, and, in general, becoming the dominating global private equity firm it is today. Among the investments Carlyle had targeted for its Carlyle Partners II fund—the one chock full of defense, aerospace, and security companies—was a maker of armored vehicles named United Defense. The owners of United Defense were FMC Corporation and Harsco Corporation—the same company that Carlyle had unsuccessfully and hostilely tried to acquire six years earlier. All Carlyle got for its $63 million back then was one lousy board seat with Harsco. But what a valuable board seat that had suddenly become.

The news around the defense industry August 1997 was that General Dynamics had bid $1 billion for United Defense, far more

than any other bidder. General Dynamics already made armored vehicles, so United Defense's expertise—they made the Bradley fighting vehicles used in the Gulf War—fit perfectly with that of General Dynamics. The deal seemed like a no-brainer: highest bidder, synchronized interests, little overlap. There really was no competition. But at the last minute, Harsco and FMC decided instead to sell to the Carlyle Group, which had submitted a low-ball bid of $850 million, 15 percent less than General Dynamics had been offering. It turns out that rumors had begun to circulate around Washington, DC, that General Dynamics was going to run into antitrust issues. Eventually, the rumors grew so loud that General Dynamics was forced to back out of the bidding, and Carlyle was there to pick up the scraps. It was another stunning victory for Carlyle.

Despite paying a fire-sale price for United Defense, Carlyle was not without its challenges regarding the new acquisition. Since 1994, United Defense had been working on a massive gun: a mobile howitzer that can fire 10 rounds of 100 pound shells per minute, 25 miles in distance, cruise at 29 mph, and reload on the battlefield. The "Crusader" was the most advanced artillery system the U.S. Army had ever conceived. It is the kind of weapon that makes the United Stated unbeatable in large scale, open warfare, lobbing multiple shells at varying trajectories so that they rain down at their desired target at the same time. It is a fearsome weapon. A killing machine. It was also United Defense's future cash cow.

But times had changed considerably since Crusader was first conceived in the early 1990s. In fact, the very nature of war had changed and had left Crusader behind. The gun had two very serious problems: It was too big, and it was designed to fight a type of battle that no longer presented itself to the U.S. armed forces. The gun is so out of date, in fact, that according to a congressionally appointed independent National Defense Panel in 1997, which reviewed all of the military's ongoing weapons projects, the Crusader was a Cold War inspired weapon, rapidly approaching

obsolescence due to a military trend toward swift deployment and agile forces. It was a gun designed to fight large scale, open field battles, the kind the United States had not fought since World War II. Unfortunately, for Carlyle, the damning report came out just a few months after the company had acquired United Defense.

The problem was that at 60 tons each—plus a supply vehicle that weighed an additional 50 tons—the Crusader was impossible to deploy quickly enough to hot spots around the world. It could not be airlifted by any of the massive cargo planes employed by the Army. And shipping Crusader would take too long to reach the ephemeral battles to which the Army had recently grown accustomed. The United States had learned that lesson the hard way, when it took more than a month to ship its Apache helicopters to the action in Kosovo in 1999, a conflict that lasted only 78 days total. The United States wasn't fighting long, drawn out land wars in Europe anymore, and Crusader's effectiveness for the new breed of fighting was being called into question.

"For the foreseeable future, no one is going to stand out in the open and fight the American forces," says Andrew Krepinevich, a member of the 1997 National Defense Panel that panned the Crusader and executive director of the Center for Strategic and Budgetary Assessments. "The U.S. will be fighting in more complex terrain, like mountains and cities, and in those areas there is not a lot of use for heavy artillery of this nature. The big challenges are how do you get there fast and how do you fight people that won't fight you out in the open." The panel recommended the Crusader program be dramatically scaled back, and some, including Krepinevich, wanted it canceled outright.

A cancellation of the Crusader program would have been catastrophic for United Defense. The company had just lost out on a crucial contract with General Dynamics to build tracked fighting vehicles for the army. It was a devastating loss, leaving Crusader as the saving grace for the company. Losing the Crusader

contract, originally valued at $20 billion, would jeopardize the future of the company and would be a mighty hit to Carlyle's premier fund, Carlyle Partners II.

The momentum against the Crusader was building rapidly by the turn of the century, as more defense analysts recognized the importance of mobile armed forces that could be deployed instantly. When General Shinseki took over as U.S. army chief of staff in June 1999, he preached the gospel of a faster, lighter army in which the Crusader played no role. Even George W. Bush, when running for office, questioned the utility of the Crusader. In a campaign speech in 1999, Bush recognized the end of the Cold War as an opportunity to "skip a generation of technology." It was all part of an effort to build an army "not by mass or size, but by mobility and swiftness," according to Bush. The future of the Army was at hand, and almost everyone was on board but United Defense. The Crusader had become the poster child of the old, lumbering Cold War army. *Time* magazine said of the Crusader, "the kind of war it was meant to fight is already obsolete." The *Wall Street Journal* called it a "dinosaur."

By all accounts, the Crusader was headed for the scrap heap. But Carlyle was just getting started. The effort the company put forth to save their precious gun would illustrate exactly how the Iron Triangle of defense, government, and business work together to the benefit of all three. Carlyle had been built to prevail in situations like these, when the large amounts of money were riding on the decisions of a few men in public office. It was time to call in a few favors.

Slimming Down

In the fall of 1999, General Shinseki told United Defense that if they did not reduce Crusader's weight to under 42 tons, light enough to be transported on a C-17 cargo plane, he was going to

kill the program. He gave the company three months. "We were given a bogey," says Doug Coffey, vice president of corporate communications for United Defense. "We were told that we had to be able to put any two of the Crusaders on a C-17, so you could take a complete system anywhere in the world."

United Defense worked furiously through the winter to meet the goal. They redesigned the engine, stripped armor, and reduced ammunition. They worked through the Thanksgiving and Christmas holidays. By 2000, they had made their designated weight: 42 tons on the button.

In the meantime, Carlyle and United Defense were waging a political battle for the Crusader. Shortly before Carlyle bought the company, United Defense organized a political action committee (PAC) through which the company would funnel contributions to key lawmakers. In the cycle leading up to the 1998 elections, United Defense made campaign contributions of only $49,500. But by 2000, under Carlyle's leadership, the company's PAC had spread around more than $180,000 to more than 70 senate and house members. The bulk of the company's largesse went to politicians on the house and senate arms committees. And often, a good deal of money found its way to the house and senate members whose districts were expected to participate in manufacturing the Crusader. It was also uncanny how United Defense planned to build manufacturing facilities for the Crusader in the backyards of key members of the arms committees, creating jobs and wealth that hadn't existed before. These are the kinds of things that get politicians reelected, and get businesses what they want.

Rick Santorum, a Republican senator from Pennsylvania, netted $10,000 from the United Defense PAC in 2000. York, Pennsylvania, is home to a United Defense manufacturing facility. Another manufacturing facility for Crusader was located in Minnesota, home of republican senator Rod Grams, who took another $10,000 from the United Defense PAC. Republican representative J. C. Watts of Oklahoma received $6,000 from the United Defense

PAC. Watts's corner of Oklahoma, which included Fort Sill, was targeted as a factory site for assembly of Crusader. Watts was also a member of the House Armed Services Committee. Carlyle was being thorough and strategic, and they were starting to make up ground. Reports of Crusader's death had in fact been greatly exaggerated.

When reporters question Carlyle representatives about the potential for people like Frank Carlucci to lobby his good friends in the Pentagon and the White House, they receive admonishments and are made to feel unpatriotic for even suggesting the thought. One *Los Angeles Times* reporter was excoriated by a Carlyle spokesperson, "I assure you [Carlucci] doesn't lobby. That's the last thing he'd do. You'd have to know Carlucci to know he'd never do that, and you'd have to know Rumsfeld to know it wouldn't matter." The company often aggressively defends itself from accusations that it lobbies or has any undue influence over key decision makers. But concentrating on whether Carlyle "lobbies" or not is a red herring argument, designed to lead reporters on a wild goose chase for the elusive definition of lobbying. Besides, according to official records, Carlyle does in fact lobby.

According to the Center for Responsive Politics, the Carlyle Group spent more than $1,200,000 in 2000 hiring lobbying firms to wage battle on Capitol Hill on behalf of United Defense. What Carlyle representatives are really saying when they assure the public they do not lobby is that their high-profile hires like Carlucci, Bush, and Baker don't personally register as lobbyists and work to drum up support for various programs. That, of course, is true. But to say that the Carlyle Group doesn't lobby is simply not true. Rubenstein, a former lawyer, has been playing a cat-and-mouse game of semantics with the press for years. Does the Carlyle Group register as lobbyists? No. Do they hire lobbying firms to do it for them? Yes. Do they influence key lawmakers and help shape policy? Of course they do. People like Carlucci

don't need to lobby, in the traditional sense of the word. They already know the lawmakers involved in key decisions, and the lawmakers know them. There are memorandums and meetings. There are unspoken understandings that are reached over a drink and a wink. "It's impossible to say when people working for Carlyle are wearing more than one hat," Peter Eisner, managing director at the Center for Public Integrity, told me. It would be ludicrous to imagine George Bush Sr. fighting it out in the trenches with all the other registered lobbyists. But does George Bush Sr. have a say in policy decisions made by this White House? That much has already been proven.

Regardless of your definition of lobbying, in the case of the Crusader, Carlucci and his team did lobby, and they lobbied hard. According to the *Wall Street Journal,* Carlucci called Defense Undersecretary Jacques Gansler multiple times to have the program spared. The *Wall Street Journal* also reported that Carlucci called defense think tanks and pleaded with them not to write anything negative about Crusader. Carlyle hired recently retired senator Dan Coats and his former staffer, a retired army colonel named Frank Finelli, to start stumping for Crusader. In an interview, Greg McCarthy, a spokesperson for now retired representative Watts, said this of Carlyle and Finelli: "Carlyle's strength was within the DOD. As a rule someone like Frank Carlucci is going to be able to have access, and members of congress are going to have an open door to Frank. Without question, they have influence. But the fact that this is all known mitigates that influence to some extent. They are not able to hide. But they have other, less visible people. They have these staff types that are behind the scenes; they work in the dark. Guys like Frank Finelli who know everything about the army and about Capitol Hill."

One of the lobbyists who Carlyle hired to work congressmen on Crusader had this to say of Carlyle: "I felt that in this effort, they were like any other lobbying group, aside from the fact that they are not one. They have been able to reach into Congress,

and there was a lot of contact with the Pentagon. They definitely influenced the decision-making process."

Lobbying laws in the United States are vague and ill defined. Lobbyists are required to register with the federal government and disclose their clients and the payment amounts publicly. But what exactly constitutes lobbying is much less clear. The formal definitions of lobby are: (1) to conduct activities aimed at influencing public officials and especially members of a legislative body on legislation; and (2) to attempt to influence or sway (as a public official) toward a desired action. By those definitions, contributing funds to various lawmakers, calling the defense undersecretary to plead for the Crusader, and hiring $1,200,000 of lobbying groups on United Defense's behalf would indeed be considered lobbying. It's hard to see what Carlyle did in this case as anything but lobbying.

What they did was save their precious gun. Between the slimming down of the gun, the massive lobbying effort, and the scaling back of the original order from 1,200 to 480, the Crusader survived. When Bush's proposed defense budget for 2002 was finally handed down in June 2001, it included funding for Crusader. It was nothing short of a Hail Mary pass with no time left on the clock for Carlyle. And within two months of the decision by Bush, the Carlyle took its first dividends from United Defense, a windfall of $289 million. The Crusader was saved for the time being, but opponents continued to fight to have the program cancelled. The raging debate would not be ultimately settled until long after September 11, 2001.

Documenting Carlyle's Access

The actions of the Carlyle Group in the fight to save the Crusader drew an enormous amount of unwanted attention to the firm. Though the company defended itself from claims of undue

influence, public advocacy groups were sure Carlyle had unmitigated and unethical access to the highest ranks of government. The problem was, proving those kinds of things was nearly impossible. Interested parties would have to tail Frank Carlucci for months, and even then, all you would learn was whom he met with and when, not what was said. It just wasn't the kind of thing a reporter could spend time on. But then there was a break.

Judicial Watch, the public interest law firm that investigates government corruption and repeatedly called for the resignation of Bush Sr. from the Carlyle Group, has been using legitimate and legal means to prove to the American public that the Carlyle Group has the ability to access and influence key decision makers in the current administration. By utilizing the Freedom of Information Act, a law that gives the right for all citizens to request and receive information from the federal government, Judicial Watch has been able to obtain a smattering of documents from the Department of State and the Department of Defense that illustrate the sway Carlyle holds. Many of Judicial Watch's requests were ignored or delayed indefinitely, heightening their suspicions of foul play and forcing them to file a lawsuit against the state and legal departments to obtain the requested documents. Finally, they saw a few documents coming their way. But only a few.

Judicial Watch grew increasingly frustrated as they were consistently stonewalled in their requests. But even the limited documents that the state and defense departments did release show the power, reach, and influence of Carlyle. The first documents Judicial Watch received are correspondences between Carlucci and William Perry, another former secretary of defense, and Carlucci's good friend Donald Rumsfeld, the current secretary of defense. In the letter to Rumsfeld from Carlucci and Perry, which is on Carlyle letterhead, the two former secretaries of defense urge Rumsfeld to heed the findings in a report the BENS Tail-to-Tooth Commission wrote on reducing infrastructure

spending in the Pentagon. Both Carlucci and Perry served on the BENS Commission: The BENS Commission stands for the Business Executives for National Security, and the suggestion, as the letter shows, is to "cut the cost of defense infrastructure and re-invest in modernization and other priority programs."

> Dear Don,
>
> Thanks for lunch last Friday. It was great seeing you in such good spirits even if you are "all alone."
>
> We thought it useful to follow up on our discussions on the need for reductions in the infrastructure of the Department—and how that might best be done. Over the past three years, the two of us have served as senior advisors to the BENS Tail-to-Tooth Commission. We believe the Commission has addressed the most critical areas that must be tackled if we are to cut the cost of defense infrastructure and re-invest the savings in modernization and other priority programs.
>
> Because the "what to do" is so well known, the beauty of the Commission's report is not in the issues it identifies—rather, it is the focus on implementation, the "how to do it," that sets it apart.
>
> We have taken the liberty of enclosing copies of this package and would be happy to discuss it with you or your staff. Or, perhaps more helpful, we would be pleased to introduce to you, or to whomever you might designate, the Commissioners who put this effort together.
>
> Best Regards,
>
> Sincerely,
> Frank C. Carlucci
> William J. Perry

In Rumsfeld's response, the secretary is clearly amenable to Carlucci's suggestions. He even invites the two of them to come in and address the staff within the Pentagon.

> Dear Frank and Bill,
>
> My apologies for the delay in getting back to you on your letter of February 15.
>
> There is no question but that we are going to have to tackle the infrastructure issue. I've been impressed with the BENS Tail-to-Tooth report, and congratulate you folks for good work. What I may do is ask the two of you to come in and meet with some of the key staff folks who are working on those types of things here in the department.
>
> I will be back in touch with you. With my appreciation and best wishes.
>
> Sincerely,
>
> Donald Rumsfeld

The BENS Commission report showed that too much money was being spent on support, overhead, staff, and the like, while not enough was being spent on supporting combat forces. In other words, Carlucci was encouraging Rumsfeld to spend less on infrastructure, more on weapons and the like—the precise business in which Carlyle is so heavily invested. The mere fact that Carlucci could have such unimpeded access to such an important decision is disturbing enough, but the nature of their correspondence is wholly inappropriate, given the obvious financial benefit of Carlucci should Rumsfeld follow his advice. And sure enough, by July 2001, Rumsfeld's defense budget was incorporating the BENS Commission's suggestions. "BENS has long advocated cutting overhead," beamed BENS CEO General Richard D. Hearney in the *Aerospace Daily*. "We are pleased to see that Secretary Rumsfeld is taking this approach in transforming the Pentagon."

The second document that Judicial Watch obtained was a long, in-depth letter from Carlucci to brand new Secretary of State Colin Powell, sent on February 23, 2001. In it, the chairman of

the Carlyle Group, again on Carlyle letterhead, lays out an extensive argument for the United States to support Montenegro's desire for independence from Yugoslavia. Montenegro is among the more outspoken republics in the formerly war-torn region of Yugoslavia.

After allying with the United States in isolating, and eventually removing Slobodan Milosevic, Montenegrin President Milo Djukanovic was now pressing his case for Montenegrin independence in the Balkans. The move was widely opposed by the international community, including the United States, because of fears that the move toward independence would again destabilize the region, which had been at war for years and had finally reached some semblance of peace. Djukanovic came to the United States to press his case in early February 2001 and was rebuffed by Secretary Powell in his request for a meeting. The Bush administration had taken a stand against Montenegrin independence, fearing it would in fact plunge the entire region back into war. Djukanovic did manage to meet, however, with Frank Carlucci of the Carlyle Group. And the following is Carlucci's plea to Colin Powell on Montenegrin independence:

> Dear Colin,
>
> We congratulate you on your great start as Secretary of State. We recognize that there is no shortage of serious issues seeking your attention, but one of the earliest will certainly be Montenegro's relationship to Serbia.
>
> As you know, Montenegro is the last of the five original non-Serbian republics to press its claim for independence. President Djukanovic was in Washington recently, and I hosted a long and spirited talk for several of us with Djukanovic to discuss his thinking. . . .
>
> Djukanovic struck us as determined to proceed to independence. . . . Djukanovic stressed that he planned to achieve independence democratically and nonviolently without destabilizing

> the region. . . . He said he understood that the real issue behind the coolness of Washington and the Europeans toward Montenegrin independence was not Montenegro itself but the impact of independence on Kosovo. . . .
>
> At the conclusion of the meeting, he asked that the U.S. return to the position that, while you prefer Montenegro to remain part of the FRY, if the process to independence is open and democratic, the United States would accept it. On behalf of Mort Abramowitz, Max Kampelman, Jeane Kirkpatrick, Richard Perle, Steve Solarz, and Hal Sonnenfeldt, we believe this position makes good policy sense and would be prepared to discuss it with you.
>
> Best wishes,
>
> Frank C. Carlucci
> Chairman

Why Frank Carlucci, the chairman of a private equity firm, would be meeting with leaders of war-riddled nations is anyone's guess. It is easy to see how anyone would be confused as to what role he has in Montenegro's independence. Is he acting on behalf of the United States? Or as a Carlyle executive, since the letter is on Carlyle letterhead and signed "Chairman." But it is even more baffling why he felt it necessary to directly lobby the state department for support of Montenegro's independence in the first place. Perhaps his thinking was that the more instability in the Balkans, the more need for war and the more weapons that are sold. All of which benefits defense contractors, like Carlyle. Although unsubstantiated, that could be the intent behind Carlucci's overtures to Powell. Regardless, Powell's administrators had the good sense to recommend against the inappropriate meeting, recognizing that Carlucci would likely have more to talk about with Powell than just Montenegro. In this memo, Powell's assistant offers the secretary two potential replies to Carlucci. Powell's stamp and initials indicate his declining of the meeting.

To: The Secretary

From: EUR—James F. Dobbins

Subject: Response to letter from Frank Carlucci

Issue for Decision

- Whether to sign attached response to Frank Carlucci, who has written you regarding the Administration's policy toward Montenegro.

Mr. Carlucci wrote to you on February 23 regarding the Administration's policy toward the government of Montenegro, asking that you take a more forthcoming position on the issue of independence. . . .

While there is no harm in such a meeting, I am not sure that it would be worth your time. The discussion at such a meeting would likely go beyond Montenegro. . . .

The few documents that Judicial Watch was able to recover show the extraordinary reach of Carlyle Group into the Bush administration. In addition to making these documents public on their Web site, www.judicialwatch.org, the organization has repeatedly called for the resignation of George Bush Sr. from Carlyle, at least while his son is president. Judicial Watch chairman and general counsel had this to say in the group's May 4, 2001, press release:

> This is simply inappropriate. Former President Bush should immediately resign from the Carlyle Group because it is an obvious conflict of interest. Any foreign government or foreign investor trying to curry favor with the current Bush administration is sure to throw business to the Carlyle Group. And with the former President Bush promoting the firm's investments abroad, foreign nationals could understandably confuse the Carlyle Group's interests with the interests of the United States government.

He goes on to say, very presciently, "questions are now bound to be raised if the recent Bush administration change in policy toward Iraq has the fingerprints of the Carlyle Group, which is trying to gain investments from other Arab countries who would presumably benefit from the new policy." This press release was issued in May 2001, before the terror attacks on the World Trade Center and the Pentagon, and before President Bush began incessantly banging the war drum on Iraq.

By the summer of 2001, the public outcry against the Carlyle Group had seemed to reach a fever pitch. The *New York Times,* the *Washington Post,* the *Wall Street Journal,* and the *Los Angeles Times* had all written grim and damning accounts of the company's business dealings within the Iron Triangle, particularly around the Crusader. Photographs and news accounts of Bush Sr. visiting the Saudi royal family had graced the cover of the *New York Times,* outraging those who believed Saudi Arabia to be more of an enemy than an ally. These were all stunning realizations for the American public. But nothing would compare to what was to come, on the day the world was changed forever: September 11, 2001.

13

9/11/01

No one wants to be a beneficiary of September 11.

—Carlyle partner Bill Conway, *The Nation,*
"Crony Capitalism Goes Global," April 1, 2002

Cast of Characters

Shafiq bin Laden	Estranged half-brother of Osama bin Laden, family representative to Carlyle investments.
Basil Al Rahim	Former Carlyle employee, Middle East fund-raiser.
Cynthia McKinney	Former Democratic representative from Georgia.
Chris Ullman	Carlyle spokesperson.
Richard Conte	Vice president and treasurer of IT Group, a Carlyle company.
Paul Wolfowitz	Deputy secretary of defense.
Donald Rumsfeld	

September 11 changed everyone's life. It's that simple. The impact is still being felt around the world as economies buckle, war looms, and uncertainty accompanies every step we take. Few can look back at the events of that day and conclude that anything good came of the attacks. But the grim reality is that for some, the September 11 attacks were not all bad. In fact, some businesses stood to make a lot of money from what went on that fateful day. Vendors on New York City streets could not stock the shelves with Fire Department hats and t-shirts fast enough.

Tourism in lower Manhattan boomed during the cleanup as hordes of onlookers crowded the streets, hoping to get a peek at the gaping hole the attacks had left.

For most New Yorkers, the willingness to profit from the tragedy was shameful and embarrassing. But it was mere pennies compared to the millions that Carlyle would go on to make after the attacks.

An Extraordinary Day

The skies over Manhattan that morning were astonishingly blue. It was one of those rare days of late summer, not a single cloud in the sky, temperatures so mild and inviting, you almost didn't mind getting up and going to work. It was an election day in New York, but there was no discernible difference in the way the city went about its business, aside from the buzz on the local news stations. Trucks honked industrial-strength horns, echoing down canyons of steel and glass. Cabbies swerved and jerked their bright yellow Fords from stoplight to stoplight on rush hour streets. Businessmen sidestepped delivery men on frenetic sidewalks, everyone hustling, with somewhere important to be. And the sky, unambiguously blue, looked down silently at the city below.

At 8:43 A.M., American Airlines Flight 11 from Boston tore through the daily cacophony of New York, ripping a path down midtown Manhattan, roaring toward the north tower of the World Trade Center. Many in midtown would shrug off the incident, wondering why a jumbo jet was flying so low, and maybe speculating with a friend, but never suspecting the ultimate destination. It wasn't until the thick, dark stripe of smoke from the explosion billowed and writhed against the clear blue sky on the southern horizon, that most New Yorkers knew something was terribly wrong. In Manhattan, the avenues cut from north to south, in dead straight lines. People began gathering on street corners

to peer down the long avenues and get a look at the smoke. Coworkers crowded around company television sets, watching with confusion and fear, as the single tower smoked and burned.

Less than 20 minutes later, as the city, thirsty for information, devoured live television news reports, United Airlines Flight 175, banking hard from the west, disappeared into the south tower of the World Trade Center amidst a ring of fire and smoke. Newscasters were initially baffled, as if their networks had suddenly come across footage of the first plane hitting the tower. Suddenly the dreadful logic of what was unfolding quickly took hold, and the grim reality dawned on the city's collective conscience at once, with inescapable reality: It was a second plane, and we were under attack.

The fear that descended on the city was immediately palpable. Without speaking, everyone not directly involved in the horrifying events taking place at the Trade Center asked themselves the same questions: How long will this go on for? Is my building safe? Who do I know in the Twin Towers? Will God ever forgive us for this?

The city was instantaneously shut down. Bridges and tunnels were sealed off. Subways stopped running. Airplanes were redirected and landed at alternate airports. Then, at 9:43 A.M., American Airlines Flight 77 crashed into the Pentagon, leaving little doubt that the attacks were ongoing.

A Chance Meeting

That same morning, in the plush setting of the Ritz-Carlton hotel in Washington, DC, the Carlyle Group was holding its annual international investor conference. Frank Carlucci, James Baker III, David Rubenstein, William Conway, and Dan D'Aniello were together, along with a host of former world leaders, former defense experts, wealthy Arabs from the Middle East, and major international investors as the terror played out on television. There with

them, looking after the investments of his family was Shafiq bin Laden, Osama bin Laden's estranged half-brother. George Bush Sr. was also at the conference, but Carlyle's spokesperson says the former president left before the terror attacks, and was on an airplane over the Midwest when flights across the country were grounded on the morning of September 11. In any circumstance, a confluence of such politically complex and globally connected people would have been curious, even newsworthy. But in the context of the terrorist attacks being waged against the United States by a group of Saudi nationals led by Osama bin Laden, the group assembled at the Ritz-Carlton that day was a disconcerting and freakish coincidence.

At 10:05 A.M., the world stifled a collective cry as the south tower of the World Trade Center, once the mightiest building on earth, seemingly evaporated behind a shroud of dust and smoke. For all the confusion and cloudiness, it was impossible to tell what had happened from television. But for those on the ground, the unthinkable was the only explanation: the tower had collapsed. Twenty minutes later, the north tower met the same fate as its twin, pounding mercilessly into the streets of downtown Manhattan, leaving thousands dead and hundreds more fleeing for their lives.

By noon, New Yorkers were paralyzed in fear, uncertain whether the attacks had ended and unclear as to the safest place to be. By mid-afternoon, all traffic on the island of Manhattan had ceased. Citizens wandered the streets, dialing and redialing their cell phones to contact loved ones, vaguely moving in the direction of their homes. Survivors walked aimlessly northward from what would come to be known as Ground Zero, caked in soot and dust, battered and bleeding, clutching strangers and sobbing. Throngs of shell-shocked Brooklynites marched silently across the Brooklyn Bridge, eager to get home and assure their families of their safety.

In Washington, a state of emergency was declared by 1:30 P.M. The Pentagon ordered five warships and two aircraft carriers to

various locations throughout the East Coast. The ships were saddled with guided missiles capable of shooting down any aircraft perceived to be a further threat. President Bush had been whisked from Florida to Louisiana to Nebraska. Colin Powell was on his way back from Latin America. Donald Rumsfeld was in the Pentagon. By 4:30 P.M., the president was on his way back to Washington, and the first reports of Osama bin Laden's involvement in the attacks has already been aired. Newspapers would later report that the bin Laden family members that were in the United States at the time, of which there were many, were quickly moved to safe locations awaiting their expedited travel arrangements back home to Saudi Arabia.

During sunset, buildings burned and lurched, cleaved and collapsed, and filled the sky with smoke and dust. Brooklyn, a mile southeast of Manhattan, lay covered in noxious dust, singed documents, Daytimer pages. The stench of burning plastic permeated every crevice of New York, a stinging reminder of the already unforgettable events of the day.

At 8:30 P.M., the president, now back at the White House, addressed the nation on television. He spoke of the "thousands of lives suddenly ended by evil." He boldly claimed that "these acts shattered steel, but they cannot dent the steel of American resolve." And he cast the net of America's vengeance far and wide in making no distinction between the terrorists who committed the acts, and those who harbor them.

It is impossible to say whether during the darkest day in America's history, it dawned on the partners at the Carlyle Group that what was to come, as a direct result of this attack, would serve their financial interests. Perhaps it was that very day, in the midst of the chaos and grief that had gripped the nation. It might have been after they had ascertained the whereabouts of their many friends at the Pentagon, and the future started to become clear. Or maybe it was the next day, when President Bush characterized the attacks in no uncertain terms

as "acts of war." Regardless, there was little doubt by the third day after the attacks that Carlyle was in for some heady times. Congress overwhelmingly approved $40 billion in emergency funds, about half of which was earmarked for the armed services. Also in the works was a massive increase in the Pentagon budget, $33 billion, in time for the Department of Defense's 2002 fiscal year, beginning October 1, 2001.

Cashing in on Tragedy

The partners of Carlyle—Rubenstein, Carlucci, Conway, and D'Aniello—stood to gain the most of anyone in the company, possibly in the country. Those four would have to shake off the devastation of September 11, and look forward to their big payday. It is not an exaggeration to say that September 11 was going to make all of them very, very rich men. This is the reality of the business they chose. And in the defense industry, war time is boom time.

"Capitol Hill is prepared to do whatever the Pentagon wants," said Gordon Adams, a budget official in the Clinton administration, in a *New York Times* piece a week after the attacks. Indeed Capitol Hill provided enough money to the Pentagon to make the budget woes and tough decisions of the past year suddenly irrelevant. Among the weapons programs that had been given new life was, of course, the unkillable gun: the Crusader.

The money was pouring in now and there was no longer any reason to deny the army its precious gun. After the attacks, opponents to the gun were silenced, not wanting to assume the political liabilities of killing a weapons program in the midst of war. On September 26, just two weeks after that attacks, the army signed a $665 million contract with United Defense for the next phase of the Crudader's development. The money would carry the gun maker through 2003. But the first prototype for Crusader

was not due to be delivered until 2004, and production of the units would not come for years after. It was highly unlikely the war in Afghanistan would still be ongoing by that time. And nothing had changed the original argument against the gun: it was still too heavy, even at 42 tons, and the need for this type of open battlefield weapon was waning, as the fighting in the caves and tunnels of Afghanistan was demonstrating. But none of that was important anymore. There was enough money to go around for everyone. "A rising tide does lift all boats," said John Williams of the National Defense Industrial Association, in a *New York Times* article.

The defense landscape had changed so dramatically, and so thoroughly, after September 11 that Carlyle quickly and wisely decided it was time to take United Defense public weeks after the attacks on the America. On October 22, 2001, the company filed an S-1 registration with the Securities and Exchange Commission, planning an initial public offering before the end of the year. In the filing, United Defense listed the following as its reasons for selling shares to the public:

1. The U.S. defense budget submission for fiscal 2002 reflects an 11 percent increase over fiscal 2001.
2. Defense procurement and development accounts are growing proportionately with overall national security spending and are expected to continue growing in the near future.
3. The Bush administration's recently published Quadrennial Defense Review calls for retaining the current force structure and increasing investment in next-generation technologies and capabilities to enable U.S. military forces to more effectively counter emerging threats.
4. The terrorist attacks of September 11, 2001, have generated strong congressional support for increased defense spending.

William Conway would later go on the record as saying "No one wants to be a beneficiary of September 11," in a report in *The Nation* entitled "Crony Capitalism Goes Global." Nevertheless, Carlyle took United Defense public on December 14, the day after Congress passed the defense authorization bill allowing for full funding of Crusader program going forward. On that single day, Carlyle took profits of $237 million. On paper, the company had made three times that amount. All the time spent lobbying government officials, calling on old friends, and greasing the palms of congressmen had finally paid off. Crusader was alive and well.

Bin Laden's Business

In the mean time, Carlyle was dealing with yet another public relations crisis, and this one dwarfed all that came before it. Carlyle had been doing business with dozens of families and businesses throughout the Middle East since the early 1990s. And they had been extremely successful in the region. So successful that they had garnered a reputation for having a tremendous amount of influence over the deal flow in the area. After all, the company had been running the Saudi Economic Offset Program for years, a government funded program designed to encourage foreign investment into Saudi Arabia, under the condition that a portion of the profits be reinvested in Saudi Arabia. In a sense, Carlyle had become the gatekeeper to foreign investing in Saudi Arabia.

Not many people knew any of this at the time of the September 11 attacks. But by the end of September, the general public would know far more about Carlyle's business than anyone at Carlyle was comfortable with. In the weeks following the attacks, the name Osama bin Laden leaped onto the forefront of America's consciousness as public enemy number one. Storefronts

hung pictures of his likeness, cut out of newspapers, with headlines of "Wanted: Dead or Alive." Not since the Red Scare of the 1950s had the United States had a more tangible opposition. It seemed that the entire nation was united in its hatred of one man. Then, on September 27, the *Wall Street Journal* ran a story entitled "Bin Laden Family Is Tied to U.S. Group." That group, of course, was Carlyle.

Carlyle had a relationship with the bin Ladens that began in the early 1990s, when they tried to put together a deal for the Italian Petroleum (IP) company. At the time, Basil Al Rahim, a young Carlyle associate, was traveling from Saudi Arabia to Amman to Bahrain, to United Arab Emirates, drumming up support for Carlyle's forthcoming international funds. "I met with 101 different potential clients in 16 days," recalls Al Rahim. "No one had really ever heard of us." Since that time, Carlyle's business in the Middle East blossomed. One of the clients that Al Rahim helped secure was the bin Laden family, which owned a $5 billion construction business by the name of Saudi Binladin Group.

The bin Laden family consists of more than 50 brothers and sisters, all the progeny of Mohammed bin Laden. Osama had his Saudi citizenship revoked in 1991, and was reportedly cut off from his family. Since his father's passing, Bakr bin Laden became the head of the business and the family, and as such he committed money to Carlyle on several occasions. It was a fruitful relationship for both parties involved. But now, all of that had changed.

The article in the *Wall Street Journal* pointed out the most stunning and atrocious irony of Carlyle's history: through Carlyle, the bin Laden family was in a position to make millions from the war being waged against their own brother. The news that George Bush Sr., James Baker III, and Frank Carlucci had visited the bin Ladens in recent years also stunned the American public. It was, in fact, the Carlyle Partners II fund in which the bin Laden family

was invested. The same fund that held United Defense, as well as a host of other defense holdings.

Carlyle told the press that the bin Ladens were only in for $2 million, a relatively small amount of money considering the whole fund was worth $1.3 billion. But one bin Laden family financial representative says the number was much larger. And Al Rahim says that earlier in his time with Carlyle, which ended in 1997, the bin Laden family had several times that amount invested in the company. Regardless of the actual amount, the irony ultimately proved too much for Carlyle, and by the end of October, they severed ties to the family, liquidating their holdings.

A month had elapsed between when the news of Carlyle's bin Laden connection emerged and the company divested their millions. During that time, every major news outlet had picked up the story. Carlyle was sustaining significant collateral damage and was ill-equipped to handle it. Up to this point, Rubenstein had always acted as the company's spokesperson to the press. But this was too much. Calls were pouring in from around the world. Everyone wanted to know about the company that connected the Bush's and the bin Ladens. It was a disaster.

A Congresswoman's Accusations

The company hired a public relations specialist for the first time in its history, but he was overmatched. The press was digging faster and deeper than ever before, dredging up all of the old controversies and conflicts of interest. From sources of varying credibility came claims the now all too familiar charges of cronyism, influence peddling, and dirty dealing in the Middle East. It was all the same accusations the press had levied before, just in greater volume than ever. But it wasn't until an actual elected official called out Carlyle by name that the company started fighting back.

In a March 2002 interview with a Berkeley, California, radio station, Representative Cynthia McKinney, a Democrat from Georgia, spoke publicly what was already making so many Americans uneasy: "Persons close to this administration are poised to make huge profits off America's new war." She went on to say, "An administration of questionable legitimacy has been given unprecedented power . . . We know there were numerous warnings of the events to come on September 11 . . . What did this administration know and when did it know it . . . Who else knew, and why did they not warn the innocent people of New York who were needlessly murdered . . . What do they have to hide?"

In the address, McKinney named the Carlyle Group as an example of the cronyism she was talking about. McKinney was implying that the Bush administration knew the attacks were coming, allowed them to happen, and was now reaping the profits, both financial and political, through its connections to the Carlyle Group. The comments resonated with a growing group of cynics on the Internet and spread like wildfire across the Web. For weeks there had been reports of an intelligence breakdown and foreknowledge of the attacks in the major news outlets. McKinney was simply giving a voice to what many already suspected. And she was absolutely lambasted for it.

Carlyle spokesman Chris Ullman, in easily his most entertaining, not to mention effective, public statement in his six months on the job asked the press if McKinney had "said these things while standing on a grassy knoll in Roswell, New Mexico?" And the public lashing was on. Representative Johnny Isakson, a Republican from Georgia, said McKinney has "demonstrated in Washington a total lack of responsibility in her statements." Senator Zell Miller from Georgia called her "very dangerous and irresponsible." Kathleen Parker, a nationally syndicated columnist, called McKinney's statements "idiotic" and bordering on treason. Parker suggested the advent of a new award, the McKinney Award, "for people too stupid to serve in public office."

Parker also pointed out that it was McKinney that publicly admonished New York Mayor Rudolph Giuliani for declining Prince Alwaleed's offer of $10 million in aid after the September 11 attacks. McKinney offered to find appropriate charities for the Prince's money if he still wanted to donate it. He didn't.

McKinney would eventually back off a little from her comments, issuing a statement saying "I am not aware of any evidence showing that President Bush or members of his administration have personally profited from the attacks of 9/11. A complete investigation might reveal that to be the case." In the end, McKinney received vindication when it became clear that a complete investigation would indeed be necessary, as enough information had emerged that indicated Bush's prior knowledge of the attacks. But McKinney's over-the-top comments probably did more damage than good in the drive to address the truly important issues surrounding the Carlyle Group. Charles Lewis, executive director of the Center for Public Integrity, said the comments undermined the important work the center has been trying to complete in regards to Carlyle by making a "caricature of the issues that may make it easily dismissible."

McKinney was certainly an easy target to discredit. And by August her previously loyal constituents voted her out of office. But at least part of what she said in that interview was dead on: Persons close to the Bush administration were in fact in a position to gain financially from the September 11 attacks, as the United Defense IPO had already demonstrated. But there were other ways the company was getting rich off the events of that day as well. Lots of ways. And September 11 was turning into an outright bonanza for the boys at Carlyle.

Beyond Big Guns

Most of the American public first heard of anthrax a week after the attacks on the World Trade Center, when a granular substance

was found in letters sent to NBC news in New York and the *New York Post* offices. But the deadly virus soon found a permanent place in the American terrorist lexicon when every day brought new cases of infection. First it was an editorial assistant at the *Post* who noticed a blister on her finger: cutaneous anthrax. Then an assistant to NBC anchor Tom Brokaw found a lesion. Then a photo editor at *The Sun* in Boca Raton. Mail sorting facilities were shut down. News media outlets were on edge, and stopped opening their mail. In many ways, the anthrax scare had Americans more on edge than the September 11 attacks. It seemed more insidious, like we were seeing the beginnings of what could ultimately be a far more deadly act of terror.

And the terror spread rapidly, from mail processing facilities in Trenton, New Jersey, to the Hart Senate Office building in Washington, DC. The country was ill-equipped to handle this kind of an attack, psychologically or logistically. Building after building was shut down, crippling postal service and severely inhibiting the Beltway's political machine. The government gave mixed messages on a daily basis, encouraging citizens not to panic, while at the same time warning of the lethality of anthrax. It was a confusing, fearful time for the whole country. But once again, Carlyle had the uncanny ability to be at the right place at the right time, and profit from the situation.

Carlyle owned 25 percent of a Pittsburgh, Pennsylvania–based company called IT Group, an environmental and hazardous waste cleanup specialist. At the time of the anthrax attacks, IT Group was in bad shape, suffering under the weight of nearly $700 million worth of debt, and on the verge of declaring bankruptcy.

In the wake of the anthrax attacks, IT Group scored a number of cleanup contracts with anthrax-infected buildings. Among the new work coming their way was the contract for the Hart Senate Office Building and the Trenton postal facility. The company had 400 workers on site at various locations working 24 hours a day, 7 days a week to clean up anthrax spores. It was snapping up contracts with government agencies left and right, like the General

Services Administration, the Army Corp of Engineers, the Center for Disease Control and Prevention, and the U.S. Navy. Richard Conte, vice president and treasurer of IT Group would tell reporters that the anthrax work "is very good for our bottom line." For a moment, it looked as if IT Group was going to miraculously save itself from bankruptcy and emerge one of the few winners in the war on terrorism.

But the anthrax scare turned out to be much more limited an attack than was originally feared. In the end, IT Group still declared bankruptcy and was bought out by the Shaw Group for $105 million plus close to $95 million in assumed debt, a price that presumably would have been much lower had anthrax never burst on the scene and given IT Group some last minute business. Carlyle had saved at least some of its bacon.

Then rumors spread around the Internet that Carlyle was also invested in a company called Bioport, which held the only government contract on an experimental and highly controversial anthrax vaccine. The company has retired Admiral William Crowe, a man who was chairman of the Joint Chiefs of Staff while Carlucci was secretary of defense. The two know each other well, but Carlyle's involvement with the company is unknown. Both companies are private, and as such have no obligation to disclose investments to the public. Carlyle Group spokesperson Chris Ullman asserts that Carlyle has nothing to do with Bioport.

There were other ways that Carlyle was capitalizing on both the airplane attacks and the anthrax letters: security. Deep in the belly of a mountain in Boyers, Pennsylvania, exists an underground facility carved into rock that holds one of Carlyle's most important investments, U.S. Investigations Services. USIS, as it is known, is a classic example of privatization, and a classic Carlyle investment. Once known as the U.S. Civil Service Commission, then the U.S. Office of Personnel Management (OPM), and finally the Office of Federal Investigations (OFI), the organization was a staple of the U.S. government's ability to gather

information on any individual applying for a job with the government. Its charter, as it had been from the beginning, was to investigate the backgrounds of government employees, and provide them with varying levels of national security clearance. USIS's cave-like work environment is something that only James Bond could love. Rock walls, tight security, no open-toed shoes, and no open flames—employees have steamed lunches brought into the facility every day. The former mine is also home to the personnel files of thousands of government officials. It is top secret stuff.

The company's history, like most of the companies in Carlyle Partners II, is highly controversial. Since going private in 1996, USIS has been incredibly successful. But getting private wasn't so easy. Employees of the government-run Office of Federal Investigations fought the privatization the whole way, fearing layoffs and salary cuts. They hired lawyers, testified at congressional hearings, and protested the decision to take it private, which was made by the Clinton administration. To quiet them down, the government offered the investigators an employee stock ownership plan (ESOP) and promised them the same or better salaries in the newly formed private enterprise. After years of acrimonious battles, the Office of Federal Investigations became USIS in July 1996. Employees retired from OFI and started work the next day at USIS.

As life under the ESOP went on, some employees felt they had been duped. One former USIS employee says that USIS executives harassed older investigators, encouraging them to leave the company so they could hire younger employees, who wouldn't vest in the stock plan for five years. That left more of the equity pie to the high-level executives, should the company ever go public or sell itself. Before USIS had gone private though, the only investigators allowed to work on national security investigations had to have five years experience. That meant that the company would have to rely on less experienced

investigators for some of the most important jobs in the country. Many of the older investigators then left in disgust. The result was a watering down of the talent at USIS, and many blamed Carlyle for the changes.

The company was growing profits and acquiring smaller firms by the turn of the century. But nothing would compare to the explosion of business after September 11. "Since 9/11, USIS's acquisition of contracts has exploded," said one employee that declined to be identified. "All the new FAA, Department of Transportation, Transportation Security Administration, INS, Customs, . . . all of those employees being hired are being investigated by USIS. They also have contracts with all the major airlines, and the contract companies who provide airport security. I do not exaggerate when I say that Carlyle is taking over the world in government contract work, particularly defense work. Carlyle is a one-world shadow government."

USIS is just one more example of how Carlyle was in a frighteningly good position to reap the benefits of September 11. There are more examples, like EG&G, a company Carlyle bought in the summer of 1999, which makes, among other things, the X-ray scanners that are used in airports. Whether the company is a "shadow government," is for conspiracy theorists to debate. But the company's uncanny ability to be in the right place at the right time sure doesn't help to dissuade the cynics.

Crusader Denouement

By 2002, Carlyle's decade of cultivating ties with prominent politicians and acquiring countless defense contractors was really paying off. President Bush was creating an Office of Homeland Security, and Secretary of Defense Rumsfeld was talking of the war on terrorism being a long, drawn out affair, perhaps something that never ends. Defense budgets were soaring and

Carlyle was already looking to take other defense-related businesses public in the coming year.

After the unrelenting bad press about the Crusader approval reached a fever pitch in Washington, Rumsfeld, at the behest of Deputy Secretary of Defense Paul Wolfowitz, finally gave the order to kill the gun once and for all, but only after United Defense had already made gobs of money from its public offering. It also came after Rumsfeld was publicly embarrassed by an Army-sponsored lobbying campaign of Congress that went on behind Rumsfeld's back, after the Defense Secretary had already made it clear the program was to be cancelled. The actions on the part of the Army would result in Rumsfeld launching an investigation (still ongoing) and excoriating those responsible for the clandestine lobbying effort. "I have a minimum of high regard for that kind of behavior," Rumsfeld would tell the press in an article by the Associated Press.

But Carlyle had already taken its profits. And besides, the very same day the U.S. Army officially notified United Defense of the termination of the Crusader contract, that same Army awarded United Defense a brand new contract for a new artillery system, much like the Crusader only much, much lighter.

"United Defense and its industry partners welcome the new contract and the challenge of bringing the technological advances matured in the Crusader program to the Objective Force and the Future Combat System," said Keith Howe, vice president and general manager of United Defense's Armament Systems Division, in the same press release that announced the end of the Crusader contract. "The contract recognizes the tremendous capability and the performance of the over 2,200 employees nationwide that brought Crusader to the Army's Proving Ground and who will now focus their energies and talents on the need to field a less than 20-ton system to the Army by 2008."

Everyone was happy with the result. Rumsfeld and Carlyle avoided a damaging public relations fiasco over the Crusader by

killing the program in a decidedly public manner. The Army was assured of getting an even better gun in the same time frame as the Crusader had been promised. And United Defense got to prop up its stock price by announcing the new contract the day they announced the death of the old contract, without ever skipping a beat. It was classic Carlyle. United Defense also picked up in September 2002, a contract to provide Taiwan with $250 million worth of amphibious assault vehicles. The deal happened after Carlucci, who is the chairman of the U.S.–Taiwan Business Council, met with Tang Yao-Ming, the defense minister in Taiwan. Just another day in Carlyle's global playground.

The saga of Crusader is one of the clearest examples of how Carlyle does business. To the outside observer, the company lives on the edge, deftly maneuvering its way through the revolving door of politics and business. Keenly aware of public opinion, and how to manage the press, Carlyle has always been able to avoid the kind of scandal that brings a company down. "No one has any proof because there is no proof," explains Chris Ullman, the company's spokesperson.

Though more financial companies are learning from Carlyle's example—hiring politicians like Al Gore or Rudolph Giuliani, during their political downtime—we may never see another company like Carlyle. The sheer volume of political capital the company has amassed in its 15 years of existence is unprecedented, and would be nearly impossible to duplicate.

With $13 billion under management, close to 500 employees throughout the world, and hundreds of defense, aerospace, telecom and health care companies in their portfolio, it is safe to say that Carlyle has already gone well beyond Eisenhower's vision of a military industrial complex. There is every indication that with the current administration, and war remaining on the foreseeable horizon, Carlyle's power and reach may exceed anything Eisenhower might have imagined when he first warned against the formation of an Iron Triangle.

The important thing to remember is that the story of Carlyle, while it makes good reading, is still young. The amount of influence the company wields is already disconcerting, but at only 15 years old, the company is in a relative infancy. The potential of the company should not be underestimated, and a healthy dose of paranoia is probably in order when viewing any of the Carlyle Group's actions. As America's most revered companies are brought down through scandals and abuses of the public's trust, it has never been more important for the average citizen to remain vigilant and skeptical, of our country's business and political leaders, even during war time, when we are expected to be exceedingly patriotic. While the Carlyle Group is certainly not about patriotism, it is a uniquely American story. It is about money, power, war, and politics. All of the things that build America's might, and compromise its integrity.

EPILOGUE

It may well be that writing a book about the Carlyle Group in 2003 is a premature exercise. The company is, after all, only 15 years old, and is just now hitting its stride. In fact, the future holds even more intrigue for this private equity behemoth than the past.

In the summer of 2002, Carlyle helped form the China Venture Capital Association, a nebulous organization charged with warding off corruption in China and strengthening ties with the Chinese government. Chang Sun, the chairman of the group, said "within the industry we need to have a minimal level of code of conduct so that we don't have people who ruin the reputation of the industry. We will talk about how to regulate ourselves rather than be regulated by the government." A truly scary prospect, but nothing we haven't seen before.

China, like Saudi Arabia decades ago, is fertile ground for American investment. Edging its way toward a more capitalistic society, China is still a massive untapped market controlled largely by the government: a combination tailor made for Carlyle's special brand of access capitalism. In other words, watch this space.

Another area to keep an eye on would be Europe. In the fall of 2002, Carlyle completed an acquisition of Qinetiq, the research and development arm of the United Kingdom's Ministry of

Defense. When news of the acquisition broke in England, the MOD came under fire for potentially compromising the national security of the United Kingdom by selling such a crucial unit to an American company run by so many ex-politicians. Fiona Draper, a representative of the trade union Prospect, which includes the scientists at Qinetiq, told reporters, "the fact that they are a foreign company will obviously exacerbate my members concerns, given Carlyle's fairly opaque structure, there must be concerns over whether undue influence may be brought to bear which may not be in Britain's interest."

The "opaque structure" to which Draper refers is not uncommon for private companies, especially private equity companies. The nature of the business is such that a private company buys other private companies, none of which are obligated to reveal their financial records. All of which makes gathering information on Carlyle very challenging. Though it excels in buying and selling businesses that are under heavy government regulation, Carlyle itself is under almost no scrutiny from federal overseers. The only thing keeping Carlyle the least bit honest at this point is public interest groups and the media. And at a time when American patriotism is at an all-time high following the attacks on the World Trade Center and the Pentagon, criticizing the current president and his father for questionable business practices is a tricky business. There is frighteningly little tolerance for muckraking at the moment.

When Carlyle was notified of this book, the company immediately circled its wagons, declining to allow any interviews of its employees and waging what one insider termed as a "scorched earth campaign," instructing anyone that could be used as a source to clam up. Several people who have spoken to the partners about this book said the company is "scared to death" of the publicity that is sure to follow.

It is common for former employees of the company to fear that Carlyle will somehow discern their identities if they speak

to reporters, either on or off the record, and ruin them. The company has required many of its ex-employees to sign nondisclosure agreements, or gag orders, instructing them not to talk about their work to the press, a highly unusual move. The result of the company essentially pleading the fifth is that they maintain plausible deniability of anything written about them. But the unintended effect is that it makes them appear as if they have something damaging to hide. All the while, Carlyle executives take umbrage at the mere suggestion that the company is secretive. Yet the names of some of their most prominent employees, like George H. W. Bush, is not listed anywhere on the company's Web site. There are many things this company doesn't want anyone to know.

Conspiracy theorists that obsess on secret societies and outlandish plots overlook the more insidious and destructive effects of a company like Carlyle. By insinuating itself into the very fabric of the world's economic structure, Carlyle has accomplished far more than any Trilateral Commission or Masonic society could dream. They have made themselves an indispensable part of the international community's cash flow. Millions of people are invested in Carlyle and don't even know it, like the 1.3 million people relying on CalPERS to manage their pension fund. Do they even know that CalPERS is a part owner of Carlyle?

Ultimately, the success of the Carlyle Group depends on its continuing ability to gain access to high-level government officials, thereby getting a jump on policy changes, both domestic and international. And that access hinges on Carlyle's remarkable track record of hiring the most powerful men in the world. To keep their stockpile of political powerhouses fresh, don't be surprised to see the company reach deep into the current Bush administration after the president leaves office and snare anyone from Colin Powell to Dick Cheney to Donald Rumsfeld to George W. Bush himself. The revolving door to Carlyle is always turning.

Though company officials are outwardly amused by the rumors and accusations that swirl around Carlyle, there is a reason why

people fear them. It's difficult to explain away certain aspects of the company. Like why George Bush Sr., in the face of mounting criticism and the undermining of his son's credibility in office, doesn't simply resign from the company? He is already wealthy, with his family's legacy secure. And there must be a thousand different job opportunities available for the ex-president that don't involve obvious conflicts of interest or incidents of international political intrigue. Or why James Baker III, with his own law firm and a foundation that bears his name, feels the need to continue toiling for a firm that clearly threatens his heretofore untarnished reputation? It begs the question: What are these men up to?

From Watergate to Iran-Contra to Lewinsky-gate, the public and the press have performed admirably in keeping our politicians honest, or at least accountable, while they are in office. But the civil checks and balances mechanism breaks down after politicians leave office. The power and influence of politicians diminishes upon their retirement from public service, but it is still formidable. And the work that Carlyle's ex-politicos perform, both in nature and in scale, is unlike anything that's come before them. That's why Carlyle will continue to be both a compelling story to follow, as well as a cautionary tale.

AFTERWORD

In a move that *BusinessWeek* immediately characterized as an attempt to "scramble the conspiracy theories," Carlyle named Lou Gerstner, the long time IBM Chairman and CEO, as Frank Carlucci's successor to the chairman position at Carlyle. Carlucci retained the role of "Chairman Emeritus." Charles Lewis of the Center for Public Integrity was quoted in the *New York Times* as saying, "I'm not sure what the motive is, but this does seem to be a move away from Carlyle's image of cashing in on the old Washington rolodex."

Gerstner will certainly bring a new sense of financial credibility to Carlyle, on which he plans to spend about 20 percent of his time, according to the Carlyle press release. It will certainly be a significant bolstering of the business side of the Iron Triangle. At IBM, Gerstner led a stunning reversal of the computer maker's fortunes through the 1990s and, unlike many tech CEOs of late, leaves with his company and his legacy well intact. His knowledge of global markets will be invaluable to Carlyle.

But the company will still be run by Rubenstein, Conway, and D'Aniello, just like it always has been. And newcomers to Carlyle should not be fooled by the impeccable pedigree of Gerstner: This is still a company that made its fortunes on the strength of political power. And it is likely that it always will be.

Appendix A

COMPANY CAPSULES

Carlyle is among the largest private equity firms in the world. It employs 491 people in 21 worldwide offices. It has more than 535 investors from more than 55 different countries. And as of June 2002, the company had over $13.5 billion under management in 21 different funds. Following is a small sampling of the hundreds of companies that have been a part of the Carlyle family since the firm's founding in 1987. From the list, which is merely the tip of the iceberg, it is clear how thoroughly Carlyle has insinuated itself into the political, military, and financial fabric of the United States. From security to weapons to information technology, Carlyle has all of the bases covered.

United Defense was born from a partnership between Harsco and FMC, or Food Machinery Corp., when the two combined their defense units in 1994. The company made a name for itself by producing the Bradley Fighting Vehicles, which was used to great effect during Desert Storm. The company was bought by Carlyle in 1997, in the midst of a major political battle over the future of its next-generation fighting vehicle, a massive mobile howitzer called Crusader. After a contentious battle to save the gun program, despite widespread opposition, the Crusader program was cancelled in the summer of 2002, after United Defense had gone public in December 2001. United Defense was subsequently awarded another contract for the development of a new

next-generation gun for the Army. Carlyle remains the majority shareholder.

USIS was originally a government-run agency called the Office of Federal Investigations. U.S. Investigations Services is a private company, headquartered in an underground bunker facility in western Pennsylvania, that performs background checks on virtually all government employees, airline employees, and preemployment checks for corporate hires. The company has more than 3,600 employees, most of which are investigators, and operates in 178 locations throughout the United States. It performs more than one million cases a year for the federal government. Carlyle invested in USIS as a strategic partner in October 1999.

Vinnell is one of the oldest companies to make an appearance in Carlyle's portfolio. Vinnell has a long, but mysterious past. Originally a heavy construction company that built airstrips in Vietnam, Vinnell burst onto the forefront of the public's consciousness when in 1975 the company signed a multimillion dollar contract with the Saudi Arabian royal family, agreeing to train the Saudi National Guard, a private army charged with protecting the Saudi monarchy. The company pioneered a wave of military privatization, leading the way for dozens of similar mercenary outfits. The company claims to have operated on behalf of the U.S. government in more than 50 countries on five continents. But recent revelations have indicated that the company, at least at one time, served as a cover for CIA activity in the Middle East. Vinnell was bought by BDM, a Carlyle company, in 1992. It was then purchased by TRW in 1997.

BDM is historically one of the most successful defense consultants in history. Thanks to its erstwhile CEO Earle Williams, the company became a player in the defense contracting business in Washington during the 1980s, and was bought by the Carlyle Group in 1990 from Loral, which had acquired the company

from Ford Aerospace. After a rocky past, BDM settled in under Carlyle, doing more business in the burgeoning Saudi Arabian market. BDM was among the few companies that stayed on in Saudi Arabia during the Gulf War, a fact that was not lost on the royal family, or Saudi citizens, who bombed the office buildings of BDM in 1994.

Composite Structures is a maker of composite and metal-bond structures. Its products can be found on everything from fighter jets to Apache helicopters to missiles. The company does about $60 million in annual sales and employs 350 people. Among the military aircraft products that Composite manufactures are: AH-64 Apache Helicopter; C-17 Military Transport Jet; and the Bell UH-1 Military Helicopter Series. The Carlyle Group is a part owner of Composite Structures, which it purchased from Alcoa in the late 1990s.

EG&G is named after its 1931 co-founding triumvirate, Harold Edgerton, Kenneth Germeshausen, and Herbert Grier. EG&G has been involved in everything from the Manhattan Project to modern day weapons design and analysis. Among the company's clients are the Departments of Energy, Defense, Treasury, and Transportation. It's annual sales are estimated at $500 million, and it employs more than 4,500 people. Carlyle bought the company outright in August 1999.

Federal Data Corporation is the premier provider of information technology services to the U.S. government. Federal Data Corporation boasts contracts with everyone from the Air Force to the Internal Revenue Service, and lots in between. Its annual revenues exceed $500 million, and it has more that 1,400 employees. Carlyle bought the company in 1995 for under $100 million, and grew its revenues in 5 years from $140 million to $538 million, then sold the company to Northrop Grumman in 2000 for $302 million.

Lier Siegler Services Inc. (LSI) is a major military contractor, providing logistics support, or supply and maintenance, of a variety of military aircraft programs. LSI has managed the Royal Saudi Air Force Peace Hawk program for more than 14 years. It provides maintenance and refurbishment for Army vehicles throughout Europe. It contracts with the Air Force for the F-15, F-5, and AH-1 aircrafts. And it has provided Army vehicle maintenance and modification since 1980, including work on the Bradley Fighting Vehicles, a United Defense product. The company was bought by Carlyle in September 1997.

Vought Aircraft is perhaps the company with the longest and richest history in the Carlyle portfolio. Vought has been making military aircraft and missiles since before the first World War. The company has worked on dozens of famous fighters and bombers, including the F-8, B1-B, C-17, and B-2 bombers. Carlyle originally bought a stake in the company in the early 1990s, only to sell it to Northrop Grumman and buy the company back outright in July 2000.

RELEASED IN FULL

The Honorable Colin Powell
U.S. Department of State
2201 C Street, N.W.
Harry S. Truman Building
Washington, DC 20520

Dear Secretary Powell: Colin

We congratulate you on your great start as Secretary of State. We recognize that there is no shortage of serious issues seeking your attention, but one of the earliest will certainly be Montenegro's relationship to Serbia.

As you know, Montenegro is the last of the five original non-Serbian republics to press its claim for independence. President Djukanovic was in Washington recently, and I hosted a long and spirited talk for several of us with Djukanovic to discuss his thinking. Djukanovic is, of course, a proven friend and ally of the United States, whose supportive role during the NATO bombing campaign helped diminish the threat to American and allied airmen. He also took great risks to oppose Milosevic and aid the Serbian democrats during their darkest hours. He protected Mr. Djindjic and many other Serbian democrats during the Kosovo war, and since 1998 has sheltered high rates of Kosovo refugees of all ethnic groups. He has been the engine of pro-Western change in this heretofore-solidly pro-Milosevic society, though he understands that Montenegro has further to go to achieve full democratization and economic reform. Montenegro will for some time remain a divided society whether or not it obtains independence, since Montenegrins who allied themselves with Milosevic continue to side with Belgrade on retaining the FRY.

Djukanovic struck us as determined to proceed to independence. He plans to hold special parliamentary elections April 22, which – if the pro-independence parties gain a majority – he intends to follow up with a referendum on independence 45-to-60 days later. If he obtains over 50 percent of the vote in the referendum, he plans to declare independence and then begin a serious negotiation with Serbia about the future nature of their relations. He said that he views independence as a means to achieve full democracy, market efficiency, and integration with Europe. By taking over the functions of security, foreign affairs, trade, customs, currency, and economic management during Montenegro's tenure as the key U.S. ally in the region, Djukanovic maintains the country has already acquired *de facto* independence.

Djukanovic stressed that he planned to achieve independence democratically and non-violently without destabilizing the region. He expressed confidence that all Montenegrins, despite their political differences, would respect the majority decision in a referendum. He said he understood that the real issue behind the coolness of Washington and the Europeans toward Montenegrin independence was not Montenegro itself but the impact of independence on Kosovo.

Djukanovic said the Kosovo problem had originated long ago and escalated after Milosevic had revoked Kosovo's constitutional autonomy. Then came the massive Serbian military intervention and NATO's war. Meanwhile, Montenegro had maintained good relations with the Albanians, and Djukanovic had established a multiethnic state and cooperated with ethnic Albanian political parties in Montenegro.

He said it was inaccurate to claim that Yugoslavia was the only framework for solving the Kosovo problem, as it was not solved when Yugoslavia existed. A solution could only come through the efforts of Belgrade and Pristina with the help of the international community. He underlined that Montenegro was irrelevant to this process and that the success of Montenegro's multiethnic governance and reforms would have a stabilizing impact on both Serbia and Albanian communities in the region.

In his view, Belgrade was just trying to frighten the international community by raising the problems of Kosovo, Macedonia, Greece, and the independence of Bosnia's Republika Srpska. The Bosnia problem, he said, was "nonsense," stressing that Republika Srpska was a problem because of Serb nationalism in Belgrade. "Belgrade tries to scare the international community that Montenegro's independence will cause Republika Srpska's secession, while all the time Belgrade is supporting Republika Srpska," he noted.

He drew our attention to Belgrade media reporting that the U.S. by refusing to receive him at your level had rejected Montenegro's independence effort. Despite this, the Serbs were still generally anti-American, while the Montenegrins were pro-American. Serbia had refused to cooperate with the Hague tribunal, while Djukanovic indicated that he would arrest indictees residing in Montenegro if the chief prosecutor handed him any sealed indictments.

Asked whether he thought that maintaining the FRY would promote stability or instability, he said there was no question that it would be destabilizing: "So long as Yugoslavia exists, Serbian nationalism lives on. The concept of Greater Serbia is not gone."

He said much of Europe was unhelpfully inclined toward the status quo. Despite the fact that Montenegro had met the terms of the European Union's own Badinter Commission on independence for the Yugoslav republics, most Europeans had gone back on these principles, especially the two nations most friendly to Belgrade, France and Italy. These legal and performance principles were the same ones by which the EU and U.S. had recognized Slovenia's independence, which is now favored by many for NATO membership.

At the conclusion of the meeting, he asked that the U.S. return to the position that, while you prefer Montenegro to remain part of the FRY, if the process to independence is open and democratic, the U.S. would accept it. On behalf of Mort Abramowitz, Max Kampelman, Jeane Kirkpatrick, Richard Perle, Steve Solarz, and Hal Sonnenfeldt, we believe this position makes good policy sense and would be prepared to discuss it with you.

Best wishes,

Frank C. Carlucci
Chairman

ACTION MEMORANDUM S/S

CLP

UNCLASSIFIED

RELEASED IN FULL

TO: The Secretary

FROM: EUR - James F. Dobbins

SUBJECT: Response to Letter from Frank Carlucci

Issue for Decision

- Whether to sign attached response to Frank Carlucci, who has written you regarding the Administration's policy towards Montenegro.

Mr. Carlucci wrote to you on February 23 regarding the Administration's policy towards the Government of Montenegro, asking that you take a more forthcoming position on the issue of independence. He writes also on behalf of Mort Abramowitz, Max Kampelman, Jeanne Kirkpatrick, Richard Perle, Steve Solarz and Hal Sonnenfeldt. At the end of the letter, he offers a meeting to discuss this issue further.

While there is no harm in such a meeting, I am not sure that it would be worth your time. The discussion at such a meeting would likely go beyond Montenegro. Attached are two alternate replies. The first does not pick up the offer of a meeting, the second does.

Recommendation(s)

That you sign the attached letter to Mr. Carlucci, which does not offer a meeting.

Approve CLP Disapprove

Alternatively, that you sign the attached letter to Mr. Carlucci, agreeing to a meeting to discuss Montenegro.

Approve Disapprove

Granted

Secretary Donald H. Rumsfeld
Department of Defense
Rm. 3E880
1000 Defense Pentagon
Washington, D.C. 20301-1000

Dear Don,

Thanks for the lunch last Friday. It was great seeing you in such good spirits even if you are "all alone."

We thought it useful to follow up on our discussions on the need for reductions in the infrastructure of the Department – and how that might best be done. Over the past three years, the two of us have served as senior advisors to the BENS Tail-to-Tooth Commission. We believe the Commission has addressed the most critical areas that must be tackled if we are to cut the cost of defense infrastructure and re-invest the savings in modernization and other priority programs.

Because the "what to do" is so well known, the beauty of the Commission's report is not in the issues it identifies – rather, it is the focus on implementation, the "how to do it," that sets it apart.

We have taken the liberty of enclosing copies of this package and would be happy to discuss it with you or your staff. Or, perhaps more helpful, we would be pleased to introduce to you, or to whomever you might designate, the Commissioners who put this effort together.

Best regards,

Sincerely,

Frank C. Carlucci

Sincerely,

William J. Perry

Granted

Dear Frank and Bill:

My apologies for the delay in getting back to you on your letter of February 15th

There is no question but that we are going to have to tackle the infrastructure issue. I've been impressed with the BENS Tail-to-Tooth Commission report, and congratulate you folks for good work. What I may do is ask the two of you come in and meet with some of the key staff folks who are working on those types of things here in the department.

I will be back in touch with you. With my appreciation and best wishes,

Sincerely,

David M. Rubenstein
Carlyle Asia Partners, L.P.
1001 Pennsylvania Avenue, N.W.
Suite 220 South
Washington, D.C. 20004-2505

Dear Mr. Rubenstein:

As part of an ongoing federal investigation, the United States Attorney for the District of Connecticut recently disclosed a series of improper and illegal activities engaged in by my predecessor, Paul J. Silvester.

The information detailed by the United States Attorney focused, in part, on improper use of finder's fees. While it is my understanding that use of such fees can, in certain circumstances, be a legitimate business practice, the federal investigation has raised a myriad of legal and ethical issues, including possible and probable conflicts of interest and appearances of impropriety. In our effort to comply with the spirit and letter of all Connecticut and federal laws, and consistent with my long-standing interest in public disclosure, it is necessary that we formally ask all firms and individuals doing business with the Office of the State Treasurer to disclose finder's fees or other compensation paid to anyone as a part of any transaction related to the introduction, award, or continuation of business with my Office.

Accordingly, I request that you provide, on the forms enclosed herewith, a detailed disclosure of any and all finder's fees, placement fees, consulting contracts or other compensation currently made in connection with any transaction or ongoing arrangements related to procuring or doing business with the Office of the State Treasurer, as well as any such arrangements during the past five (5) years. As part of this disclosure, I ask that you identify the individuals or entities receiving any such compensation and the amount of each such payment. In the event your company did not pay finder's fees, placement agent fees or furnish other compensation at any time during this period, kindly so indicate in your response. In addition, be advised that such disclosure will continue to be the policy of this administration. For your convenience, these forms may be downloaded from my website, www.state.ct.us/ott/.

Please forward your response on or before October 15, 1999 to the attention of Catherine E. LaMarr, Esq., General Counsel, Office of the State Treasurer, 55 Elm Street, Hartford, Connecticut 06106-1773. Should you have any questions regarding this request, you may contact Christine Shaw, Esq., Chief Executive Assistant, at (860) 702-3211.

My Office values our relationships with each of our vendors and we appreciate your prompt and careful attention to this matter.

Sincerely,

Denise L. Nappier

Suite 220 South
Washington, D.C. 20004-2505

Dear Mr. Rubenstein:

By letter dated September 30, 1999, I requested that your company voluntarily disclose all compensation paid or promised in connection with any transaction or ongoing arrangements related to procuring or doing business with the Office of the State Treasurer since January 1, 1995. To date, we have not received a response to this request. In the event you already have submitted your full and complete disclosure, you may disregard this letter.

Disclosure of this information is the policy of this administration. Failure to comply will certainly jeopardize your company's current business relationship with the Office of the State Treasurer, as well as any prospects for future business. Please forward your response on or before November 15, 1999 to the attention of Catherine E. LaMarr, Esq., General Counsel, Office of the State Treasurer, 55 Elm Street, Hartford, Connecticut 06106-1773. Should you have any questions regarding this request, you may contact Christine Shaw, Esq., Chief Executive Assistant, at (860) 702-3211.

In the event we do not receive a full and complete response by the close of business on November 15th, we will work with Connecticut's Attorney General to pursue every legal recourse available to suspend or end our business relationship with your firm.

Sincerely,

Denise L. Nappier

AN EQUAL OPPORTUNITY EMPLOYER

ACKNOWLEDGMENTS

Researching and reporting this book presented me with a number of unique challenges. First, the Carlyle Group has a very obvious fear of publicity and, as a result, declined to be interviewed for the project. The company went a step further and notified many of their friends, former colleagues, and business partners, if contacted, not to cooperate with the author. Some of them respected the wishes of the folks at Carlyle, some of them did not, and some just fell between the cracks. But with the exception of a brave few, most notably Stephen Norris, almost all of the sources that still had direct contact with Carlyle either declined to be interviewed or would do so only if their identities remained anonymous. There is a very real fear of retribution out there.

All quotations are either from those that said them or from those that overheard the words being spoken, unless otherwise attributed to a newspaper or magazine article. I would like to thank Tim Shorrock for his work with *The Nation,* Michael Lewis for his work in *New Republic,* and Leslie Wayne for her work in the *New York Times.* And I would have been lost without the work of dozens of journalists from the *Washington Post,* which witnessed and chronicled the birth and rise of the Carlyle Group, understanding

its impact and import every step of the way. I would also like to thank *Harper's Magazine,* the *Houston Chronicle,* and Jeffrey Toobin, the author of *Too Close To Call: The Thirty-Six Day Battle to Decide the 2000 Election,* from which I gained all of my knowledge of the events that took place in Florida following the 2000 election.

In addition, I would like to thank my editors at Red Herring, particularly Duff McDonald, Blaise Zerega, and Jason Pontin. I would also like to thank my editor at John Wiley & Sons, Jeanne Glasser, for believing in this project.

And most importantly, thank you to my family, friends, and especially my wife Michelle, without whom I would not have been able to complete the task at hand, or any other task for that matter.

Dramatis Personae

To me, that is the hallmark of credibility: matching deeds to words.[1]

Alan Blinder, *Central Banking in Theory and Practice*

We do what we say and we say what we do.[2]

Otmar Issing, 'The Eurosystem'

Words are also deeds.[3]

Ludwig Wittgenstein, *Philosophical Investigation*

In the beginning was the deed.

Goethe, *Faust* (I).

Acknowledgements

I would like to thank Irwin Collier, Jörg Sydow, Horst Tomann, and Jürgen Wolters at the School of Business and Economics, Free University of Berlin, for their institutional support and acknowledgement of this work. I thank two anonymous reviewers for their helpful comments.

I also thank Amalia E. Rothman and Gerard Rowe for editorial and critical comments. Many other people commented on some parts of the earlier versions of the text or simply listened to the presentation of its concept. I am grateful to Otmar Issing of the Center for Financial Studies at the Goethe University, Frankfurt am Main, for his cooperation and thoughtful comments on the topic, which greatly improved previous versions of the manuscript. I thank Jürgen Trabant at the Free University of Berlin and Jacobs University, Bremen, who encouraged me along the mountainous path of the language sciences through his valuable comments and criticisms on my research papers. In particular I benefited from conversations with Gerd Gigerenzer from the Max Planck Institute of Human Development, Berlin. I also benefited from discussions with Carsten Fischer, Raul Heimann, Birgit Ladwig, John Lüttel, Beate Maennel, Heiko Metzger, Katrin Robeck, Daniel Roters, Mark Theis, and students in my seminars at the Free University of Berlin and University of Trier. I thank all of them.

Introduction

> The central bank owes the public transparency and accountability. Communication is at the heart of both.
>
> Blinder and Goodhart et al. 2001, 2

This book is concerned with the new paradigm of central banking. In a democratic society, transparency and accountability are not optional, but are required of independent central banks. The independence of modern central banks does not infer that central banks exist independently of structures in society or of the interactions between various agents in the financial markets (Cukierman 2008; de Haan, Masciandaro, and Quintyn 2008). A feature of the new paradigm is the interactive dimension of central banking and the financial markets. 'Monetary policy works *through* the market, so perceptions of likely market reactions must be relevant to policy formation and *actual* market reactions must be relevant to the time and magnitude of monetary policy effects. There is no escaping this' (Blinder 1998, 60).

The current consensus relates central banking practice to communication. The reason regularly given for why a central bank should speak publicly, or for why communication matters, includes the description of important aspects of the transmission process, the improved predictability of interest rate projections, and the shaping of market expectations (Bernanke 2004a; Chirinko and Christopher 2006, among others). A central bank's actions need also to be understood by market participants. Empirical findings underline the importance of the point of reference: the communication of a central bank with financial markets has crucial influences on interest rate projections made by market participants, and generates an anchor for the expectation-building process (Ehrmann and Fratzscher 2008; Issing 2005a; Kohn

and Sack 2003; Rudebusch and Williams 2006). This implies that the effectiveness of a central bank cannot be separated from language interactions and, hence, from 'language games'. Moreover, communication cannot be reduced to the disclosure of information by a central bank.[1] To put it more precisely, monetary policy and a central bank's communications cannot be described by linear input-output transmission, nor by purely deductive arguments resulting from a model view. The reason is – as explained by Alan Greenspan (2004, 36), among others – because 'uncertainty is not an important feature of the monetary policy landscape; it is the defining characteristic of that landscape'. There is no option as to whether or not to acknowledge this uncertainty. With uncertainty in the landscape, central banking needed anchoring.

I should immediately add that through communicative interactions and the use of language, monetary policy must be seen as a distinguishing feature of the decision-making process, since the decisions and actions of a central bank indicate its goals. Consequently, the attempt at achieving its goal also depends on the public's understanding. The functions of language in daily communicative interactions cannot be explained by the analogy of a mechanical impulse-resonance, as assumed in the traditional model of central banking. Meaning and understanding are generated through a process of communicative interaction. Furthermore, meaning and understanding arise out of a person's perception, recognition, and interactive procedures. Any reflection on information, interaction, and situation necessarily refer to language activity, or ways of acting. I would like to propose that modern central banking, too, should link its consideration of communicative interactions with cognitive science and language sciences.

According to the modern view of central banking – see, for instance, Blinder and Goodhart et al. (2001, 1) – 'attitudes and policies toward central bank communications have undergone a radical transformation in recent years. Not long ago, secrecy was the byword in central banking circles. Now the unmistakable trend is toward greater openness and transparency. Increasingly, central banks of the world are trying to make themselves understood, rather than leaving their thinking shrouded in mystery'. The view that 'the times, they are a-changin' has significant implications and consequences for economics and, hence, for central banking. Changing times inevitably include changing questions, taking the initiative of rethinking the primary methods and instruments in economic science, and the acceptance of an interdisciplinary approach to macroeconomic theory. Alan Blinder (2004) characterized the changes in modern central banking as a 'quiet revolution'.

In his presidential address, 'the missing motivation in macroeconomics' at the American Economic Association meeting in 2007, George Akerlof argued for an interdisciplinary approach in the field of macroeconomic theory, one of preferences with a concept modified and supported by research in sociology and psychology, to replace the prevailing abstract and deductive approach to economic problems. He refers to the dominating 'five neutralities' in macroeconomics. Preferences in macroeconomics are, respectively, devoted to abstraction or to model abstractions. These neutralities are linked to premises of the model and predefined preferences and, hence, to the avoidance of linking them to actions, observations, and behaviour. Norms, the interactions in changing contexts and circumstances which socially determine values and preferences, are the missing factors.

I set out in this book to assess certain implications and consequences of this new paradigm which until now have barely been discussed in the literature: the predominant formal language approach in central banking literature has to be supplemented by an everyday language approach. In doing so, I propose to focus on expectations and economic interactions as communicative actions, hence as articulations or 'language games'. The constitutive role of the use of everyday language should be integrated as an important component in the modern view of central banking and not be neglected in the academic debates. Language is not a label (Issing 2008).

Even the attempt to communicate through a coded language or a special, formally designed language has to be retranslated into everyday language in order to be an appropriate form of central bank communication. A coded language or formally designed language approach to economics and central banking is free of ambiguity and vagueness, which seems to be beneficial because of their particular methods, which focus on quantifying, measuring, and forecasting. The risk of a coded language, or even a formally designed language, is that necessary changes in monetary policy action will not be part of the communication because the coded language is defined as being independent of changing environments and contexts. A coded language approach to central banking, regardless of its context, culture, and constitution, lacks credibility and reputation. A coded language *cannot* fulfil the central banks' genuine task of guiding market expectations. My point is this: the uncertainty would be elevated by the use of a coded language or a purely formally designed language.

In contrast to a coded language, the use of everyday language – the language in practice – configures a certain context which is understood by

the participants of the financial markets and the central bank. Therefore the language in use functions as an anchor for the expectation-building process and decision making in an uncertain environment. Certainty does not arise out of formal symbolic or deductive reasoning because it is encapsulated in a predefined world or system. It therefore provides certainty within a well-defined logical system. According to acting in markets, certainty has to be grounded in language interactions. There is no certainty to be found in reliance on numbers or codes. Certainty is not an option or possibility. According to the uncertain landscape of central banking, *any kind of a vision of certainty* can only be perceived as the result of a common understanding among heterogeneous agents in the markets (Simmons 2006).

Regarding the landscape of uncertainty, individuals are creating a realm of certainty by linking through action and articulation their perceptions of the situation (in which they are acting) to the perceived actions of other agents (Gerd Gigerenzer and Richard Selten 2001a, 2001b). John Maynard Keynes (1936, 161) described this interaction and reliance on one's own view in relation to the perceived views of other agents as follows: 'Most, probably, of our decisions to do something positive, the full consequences of which will be drawn out over many days to come, can only be taken as a result of animal spirits – of a spontaneous urge to action rather than inaction, and not as the outcome of a weighted average of quantitative benefits multiplied by quantitative probabilities.' The metaphor 'animal spirits' implies a particular state of confidence and trust in a particular situation (Boyd 1979; Muchlinski 1996a; Akerlof and Shiller 2009). A necessary condition in creating a state of confidence is that this confidence is perceived and shared by other agents in the market. To argue that an agent creates his or her private state of confidence makes no sense. A state of confidence cannot be private. Also, an agent in the financial markets cannot create a private meaning of the situation, although she or he is able to perceive the situation differently. This is also true for the use of language, as Bertrand Russell and Ludwig Wittgenstein emphasized. Wittgenstein (1959, § 241) pointed to agreement in uncertain situational contexts: 'That is not agreement in opinion but in form of life.' Agents in the markets take direct possession of the commodity or product, or the option to buy or to sell, without having doubts. They use everyday language. In acting without doubts, heterogeneous agents create a kind of certainty or state of confidence homogenously. This is comparable to a building having supporting foundations. The 'logic' of everyday language is rooted in language interacting in practice. Everyday language does not refer to a system of abstract logic.

I wish to introduce four main considerations: first, according to the success of the scientific process in the sciences, it should be noted that the scientific process is not – at least ideally – based on the avoidance of alternative questions and methods of exposition. This is also true for central banking and macroeconomics. The crucial objective for a central bank is to guide market expectations. A central bank's way of acting creates the normative meaning of sentences. Concepts are embedded in economic interactions. The meaning does not arise out of a prefixed or predetermined world.

A second consideration concerns the central premise throughout this book: anchoring is only possible by acknowledging that language interactions and different modes of communication are essential to economics. Economics is not driven by universal laws or natural laws (Issing 2010a, 2010b; Muchlinski 2011). This is of crucial importance to a central bank's task of guiding market expectations. A central bank's way of acting creates the normative meaning of sentences. Concepts are embedded in the language-game. Not only are times changing, but language-games also are changing and bringing, therefore, a change in concepts and the meaning of words. It is not possible to anchor central banking in a system of formal symbolic or coded language successfully. To explain a word requires going back to the language-game itself, which is also mutable, as the current financial crisis has underlined. The current crisis has also been driven by new financial methods of reallocation and by financial products labelled by codes: AAA, AA, A, BBB, BB, B, and so forth. This 'Esperanto of the capital markets' (Franke and Krahnen 2009) has been substituting for everyday language since the late 1990s. These codes have been created by rating agencies and accepted throughout the economic business as a guarantee of quality and as a promise of gains and wealth. As a code system, this method has contributed to keeping up an appearance of certainty in order to reallocate risks internationally.

My third consideration deals with the implications and consequences of the new paradigm of central banking. The implications arise from the proposition that the meaning of a sentence is embedded in the use of its context. For this reason, I provide a reinterpretation of 'monetary mystique', linking this term both to its historical context and to current debates in central banking literature.

A fourth consideration examines the risks and benefits of coded language by emphasizing communicative interaction as language-based interaction – that is, interaction based on everyday language. However, this text subscribes to communicative interaction as being aimed at a

common understanding and, therefore, as being opposed to mechanical analogies. A central bank's decisions and communicative interactions can be devoted neither to abstract premises nor to a coded language.

The innovation which emerges from this book is the supplementing of standard economic methods, known as deductive and formal reasoning, with an interdisciplinary approach linked to inductive and hermeneutic principles. The argumentative strategy favoured by deductive reasoning emphasizes truth and certainty according to predefined premises, axioms, and variables. Embedded in a logical system of argument, deductive reasoning leads to exactness, non-ambiguity, and the measurability of economic factors, which themselves have been prepared in order to be quantified and measured. Here we can understand why deductive reasoning in economics is indisputably acknowledged. Deductive reasoning presumes certainty of knowledge in the present and future, since the context is presumed to be stable or invariant. However, this certainty arising out of deductive reasoning is a result of the prearranged, systematic application of predetermined, fixed rules to a subject.

Turning to inductive reasoning we find an array which seems to frighten scientists because it moves from the sphere of influence. Inductive reasoning implies vagueness, ambiguity, uncertainty and is mainly based on probabilistic argument. However, neither inductive reasoning nor the hermeneutic and the heuristic approach to social phenomena presume truth or scientific objectivity. As outlined in the previous paragraph, the presumption of truth and objectivity is regularly attributed to deductive reasoning with regard to the scientific design of the deductive argument as logical consistency, coherence, exactness, and precision.

As is appropriate for all sciences, economics uses particular concepts, categories, symbols, and codes in describing and explaining its scientific results. Scientific terms are used in order to be as precise as possible and to avoid disputes about their meaning. Similar to different branches in macroeconomics, central bank literature uses systems of codes. Their meaning is easily understood by deductive reasoning. They are understandable by tautologies. For instance, the decision to raise the Federal Reserve Funds rate leads to a particular perception that the Federal Reserve Bank (Fed) now has a different assessment of the business cycle and movement of prices than before, regarding, for example, that expectations of inflation are in the air. The Federal Reserve Funds rate is embedded in a logically defined system regarding the macroeconomic effects of its movement. Every decision to change the Federal

Reserve Funds rate will therefore unavoidably move other variables of this predefined system. Moreover, this predefined system contains a huge variety of different specified variables, such as expectation, risk, uncertainty, and communication, among others. At this point the crucial question reaches the agenda of how the public perceives and understands the decision of the central bank regarding the public's own methods and instruments for assessing the economic context and creating economic forecasts regarding inflation expectations, short-term and long-term interest rate projections in various money markets, and the expected yields.

Communication in science is often based on axiomatic and deductive reasoning. However, to focus on language in different contexts and communication interaction of central banks requires stepping beyond the axiomatic logical system in order to acknowledge the role of language as an instrument of cognition and acquisition of knowledge. Language is not neutral towards thoughts and cognition. In order to be successful 'through' market interaction, a central bank needs to acknowledge the constitutive role of language for creating economic contexts.

We need to perceive that neither central banking *nor* the communication of central banks will lead to truth or objectivity. The success of communication is based on language interactions among heterogeneous participants in distinct markets surrounded by variable contexts. Therefore, truth and objectivity are embedded in the language interaction. Moreover, communication also implies miscommunication which will initiate further dispute. We have to recognize that communication is not a linear transformation of information and an already given meaning. Understanding is not the exchange of an already given meaning of a sentence or of words. Understanding is not based on a measurement of wording, because the meanings of sentences do not come from the measurement.

This book also endeavours to add consideration of communicative interaction and the creation of meaning and understanding from modern cognitive and language sciences. I propose a *conceptual framework based on three dimensions* to expound upon why a coded language is not capable of contributing to the effectiveness of monetary policy. I want to bring central bank literature into dialogue with important research in the language sciences as well as with heuristic and communications approaches in the social sciences. I investigate why economic interactions and procedures can be treated neither as 'universal laws' or 'invisible hand mechanisms', nor be discussed in terms of 'universal concepts'. Economics as a social science must also focus on

particular cases of the discontinuity of events, and on the sensitivity of contexts. Economics and economic activities are without question not self-regulating or self-ordering mechanisms or functions. The most recent financial crisis has, almost as a cliché, shown how relevant are changes in macroeconomic concepts, methods, and instruments. One has to acknowledge that a barter economy differs fundamentally from a monetary economy. A monetary economy is based on a multiplicity of relationships between creditors and debtors as types of contracts, and on heterogeneous agents in the domestic economy as well as in different countries, regions, and currency areas. Macroeconomic policy can only be treated in light of coordinative interactions between these different agents. In this light the importance of institutions becomes a significant consideration, because they are 'repositories of knowledge and experience' (King 2004). It should also be stated here that this book does not deal with the role of language as modelled in game theory, nor with institutional economics and evolutionary economics. A great deal of work has already been done in this field of research. Although investigation of central banks as learning organizations with particular interorganizational relations and networks still remains to be done, it is not the subject of the present book. This book explicates the interdependence of structures and actions, customs, norms and their social impregnation, and how understanding by disagreement, agreement, and interpretation shape contexts because meaning and understanding are not predefined, already given qualities which can be exchanged in market transactions.

This book is structured as follows: In Chapter 1, certain aspects regarding the Federal Reserve Bank's road from 'monetary mystique' towards 'matching deeds to words' are expounded with reference to lines of argument in the Federal Open Market Committee (FOMC) transcripts of the Paul Volcker era. The Volcker era could be reread as an example of an inadequate formal approach, because the 'k-percent rule' or 'money growth-targeting' ignored the circumstances of institutional interactions between the central bank and commercial banks regarding the concepts of money, and of money demand and supply in the economy.

Chapter 2 introduces a conceptual framework for communicative interaction, which combines the three dimensions of information, interaction, and context. To understand how monetary policy works *through* the market, one needs to acknowledge the processes of perception and the understanding of the central bank's talk and communication within markets involving many different market agents.

Chapter 3 turns to consider the argument that because central banks are part of society central banking needs to refer to circumstances. Central banks shape circumstances by their communicative interactions. This chapter discusses the *forecast-based approach* to central banking as an example that links a central bank's judgment to changing circumstances, because it gravitated towards new concepts and different methods of communication in order to configure the debate on the methods of decision making and monetary policy. The chapter introduces the 'risk-management-approach' as a superior approach to central banking, emphasizing that a central bank should avoid being trapped into selective perception and a cognitive straitjacket, thereby being imprisoned by cognitive dissonance and captured by false precisions, exactness, and a supposed linearity of information through following inadequate, rigidly fixed rules and optimization instead of problem solving.

Chapter 4 examines the further aspects of the interdisciplinary approach to central bank communication. If we remember that a central bank can control only the Federal funds rate, which should influence long-term real interest rates (and, hence, the inflation expectations of different interactions in various financial markets), a central bank needs to reflect on its own contributions to the creation of the context which surrounds the decision-making process of both financial markets and the central bank.

Chapter 5 moves on to address the question which runs as a thread through the book, considering a variety of aspects that can be grouped under the heading 'risks and benefits of a coded language or purely formal language approach to central banking' with reference to some debates on the formal language approach to sciences from the 1920s, which are of great relevance to current debates.

The conclusions of the research are presented in Chapter 6.

1
The Way Out of 'Monetary Mystique'

> The mystique thrives on a pervasive impression that central banking is an esoteric art. ... The esoteric nature of the art is moreover revealed by an inherent impossibility to articulate its insights in explicit and intelligible words and sentences. Communication with the uninitiated breaks down.
>
> Karl Brunner 1981

Discourse on central bank transparency and communication has been moving beyond the silence of a black-box mechanism. It has initiated a theoretical upheaval on modern central bank theory. This is also true for the areas of research related to a central bank's interactive procedures touching its market interdependencies and relations. The focus on the central bank's way of acting, on the use of language and modes of communicative interactions, has also been drawing much attention.

Two decades ago, central banks were envisioned as being 'temples of secrets' (Greider 1989) surrounded by so-called mysterious silence and opacity. Today, modern central banks no longer perceive themselves as temples of secrecy rooted in the realm of metaphysics and unable to communicate and explain their procedures. This is true for a central bank as an institution interacting with the financial market which, itself, is not invariant. As an institution, a central bank acts within historical and contextual forms of life and norms. The success of a central bank's communicative interactions with the agents of financial markets is not rooted in presumed invariant structures of the markets itself. Any communicative interaction involving the central bank affects and shapes its circumstances and, therefore, the context of its action. The goal of a central bank, its mandate of price stability, its policy and instruments, are not phenomena of nature and, hence, not an issue for

natural science. The concepts of economics as social science are not embedded in natural science or natural laws.

Paper money is created by the central bank based on certain principles and, foremost, on the acceptability of its role in society. A central bank's macroeconomic responsibility is to provide price stability and, hence, stable money throughout the whole of the economy. Credit is created by teamwork or interaction between central banks and commercial banks. Commercial banks borrow money from central banks in order to lend it to the public; they also use the deposits or savings held by the public. Commercial banks have to pay back the borrowed money to the central banks. Under normal circumstances, the process works because commercial banks function as intermediaries. They borrow money from central banks and lend money to the public at a higher interest rate than they have to pay to for borrowing or for the deposits.

The acceptance of a central bank's money depends on how money possesses credibility as a store of value, a standard of deferred payment, and medium of account (Tobin 1983). Money is not a veil for a barter economy. Money is not neutral regarding its function in a monetary economy. Taking this into account, any action of a central bank is, itself, a part of conceptual actions within a complex situation. It is for this reason that central bank talk (see Blinder et al. 2001, How do central banks talk?) matters and why it gives the use of language an important role in shaping the position of central banks. As was said in the introduction, words or sentences have no meaning beyond their use in a context. 'Every sign *by itself* seems dead. What gives it life? – In use it is *alive*' (Wittgenstein 1978, § 432). The history of central banks provides many examples of how the meaning of words has changed according to the changing environment. As treasuries of knowledge and experience, central banks have to recognize the epistemic preconditions of a successful communicative interaction with the market. Otherwise it will treat economic agents as machines.

Knowledge of context and environment is also created. This embodies a central bank's history, which can be described by using concepts expressed in language. These concepts are impregnated by their usage in historical context and have to be reread in the light of current debates. The literature on central banks and their decision-making procedures under conditions of uncertainty has begun to reconsider and revise important concepts (Blinder et al. 2008, 2001; Issing 1999). Also, economics, like science, changes all the time and, hence, the economic background also shifts constantly. We base all the judgments with which we formulate decisions and actions – and regard

concepts, meanings, and methods –upon variable social contexts. Therefore concepts, conceptual investigations, and methods must be flexible.

It is a crucial characteristic of scientific procedure to change, rebuild, and reassess concepts, methods, and models when they do not fit the contemporary world. Judgments about the market have constantly been rethought and scrutinized. Only through living in a 'panelled boardroom', or seeing oneself as a representative of the principles of the classical or neoclassical world, are we embedded in a certain world without any perceived need to change our views and considerations. In contrast to this artificiality of a constructed world, judgment made under uncertainty necessitates the orientation of a common background. Keynes criticized the artificial world in his article on the theory of interest rates:

> [A]ll these pretty, polite techniques, made for a well-panelled Board Room and a nicely regulated market, are liable to collapse. ... I accuse the classical economic theory of being itself one of these pretty, polite techniques which tries to deal with the present by abstracting from the fact that we know very little about the future'. (Keynes 1937, C.W., XIII, 215)

The contextually received history of central banks can be judged and described by their applied concepts and their implemented actions, both then and now. The new paradigm which can be pictured by two main concepts of 'matching deeds to words' (Blinder) and 'we do what we say and we say what we do' (Issing), implies the acknowledgement of language as a social fact. The consequence is that the predominant formal language approach in central banking literature has to be supplemented by an everyday language approach. Even the attempt to communicate through codes or a special 'central bank' language has to be rethought if this could be an appropriate means of central bank communication.

Language is not the gateway to transmitting an already given meaning, like throwing a billiard ball. The function of language activity in a dialogue – even the communicative interaction of the central bank with non-homogeneous agents of the financial market is a dialogue – derives from the wish to be understood. People communicate to reach a common goal or understanding. 'Nothing could be more obvious: we want to be understood, and others have an interest in understanding us; the case of communication is vastly promoted by such sharing' (Davidson 1994, 9). This

is also true for institutions which communicate through people, agents or, for instance, the chairman of a central bank.

As it is known from the history of science, any event is embedded in its historical context. It is not possible to separate the event from the context without, as a result, producing a meaningless object. Also, this meaning and its understanding are embedded in action. Emphasis upon coded words implies the danger of misunderstanding and of veiling the context in which a central bank acts. The attempt to rely upon a coded language neglects the conditions under which the central bank acts to carry out its mandate. In Chapter 5, I emphasize that a strategy of a coded language (or purely formal language) approach to communicative interaction is an impediment to the central bank's road to satisfying its mandate. The effect of a monetary institution like a central bank is a result of its capacity to act and of the acceptance of these actions by society.

The Federal Reserve's road to transparency, flexibility, and monetary policy is evident: since its turning point in the year 1994, the Federal Reserve has been redefining some of its concepts and monetary policy rules (see Kohn and Sack 2003). The Federal Reserve Bank (Fed) has attempted to move out of 'monetary mystique' towards a practice of 'matching deeds to words'. At this point, we need to ask what the terms 'monetary mystique' and 'mystique' mean as regards the history of the Fed, and in comparison to the modern view of the central bank following the maxims: 'matching deeds to words' and 'we do what we say and we say what we do'. I will try to provide an answer to this. Here, I want to outline the changing visions of a central bank's policy.

The term 'monetary mystique' was created to describe the monetarist experiment of the Federal Reserve Bank. I will go on to link the term 'mystique' to the current debate on central banking. The present state of academic discourse emphasizes transparency and communication of central banks as being desirable for both the enhancement of the effectiveness and accountability of central banking (Blinder et al. 2008). In current times there is no longer a possibility for a central bank to conceal itself behind a wall of so-called non-interactive behaviour, as was the case until the Federal Reserve began to change its communications strategy.

Historical trends in macroeconomics can be summed up by focusing on the consequences for both central banks and monetary policy between 1973 and 1998. The breakdown of the Bretton Woods agreements and the international exchange rate system in 1973 (which breakdown actually began in August 1971 with the Smithsonian Agreement),

provided a challenge for central banks in the industrialized countries. The spirit of the Bretton Woods agreement led to a fixed-rate dollar standard from 1950 to 1970, which also implemented the U.S. dollar as a *numéraire*. The Bretton Woods agreement kept exchange rates within 1 percent of this par value. The United States remained passive in the foreign exchange markets, while European countries fixed a foreign par value for domestic currency by using gold, or a currency tied to gold, as the *numéraire*. This asymmetric system of international monetary policy meant that countries other than the United States intervened in the foreign market to stabilize their domestic currencies by using the U.S. dollar as an intervention currency. The U.S. anchored the dollar price level for tradable goods by an independently chosen monetary policy in the United States, while industrial countries other than the United States subordinated the domestic money supply to the fixed exchange rate. The role of central banking in this system of exchange rate targets remained hidden.

After the late 1960s, the willingness of other countries to peg their currency values to the overvalued U.S. dollar evaporated. The U.S. dollar came under pressure to depreciate. A rearrangement to a new par-value system was made in December 1971, but lasted only until February 1973. Up to that point, the central banks of the Western world had conducted monetary policy under the exchange rate target anchored by the U.S. dollar.

How did economic theory respond to this changing economic environment? Both economic theory and empirical evidence noted these changes to central banking and monetary policy formulation. It has been observed that the policy changes after 1973 were not driven by a simple causal mechanism of empirical evidence or theoretical reasoning. 'Economic science evolves by way of a complicated back-and-forth interaction of theoretical and empirical considerations' (McCallum 1999, 172). After 1973, central banks developed new strategies to stabilize the paper money standard around different monetary regimes such as inflation targeting, monetary targeting, exchange rate targeting, and different strategies between rigidly fixed exchange rates and flexible exchange rates. The era of the floating rate, 1973–84, also implied that the United States remained passive in the foreign exchange markets and decided on monetary policy and central banking autonomously and independently with respect to the foreign exchange value of the U.S. dollar (Eichengreen 2007).

Since then, the Federal Reserve Bank has been acting in a significantly different role in the international monetary system compared to

other central banks. The U.S. dollar serves as the nominal anchor. The international floating rate system, combined with gradual elimination of capital controls (and, hence, free currency convertibility of the main currencies of this so-called non-system of the post-Bretton Woods era) did not imply that central banking in the industrialized countries could avoid stabilization policy, that is, aiming at a nominal anchor (Mundell 1995). An example is the regional monetary system implemented by the European Monetary System as a Deutsche Mark Era from 1979 to 1992 (McKinnon 1993).

Changes in both the macroeconomic and central banking theories of this epoch coincided with the rational expectations hypothesis as a fundamental new approach to economic theory. McCallum exposed several misconceptions about the meaning of the rational expectations hypothesis. The reason why the expectations of agents will agree with the analyst's model of the economy can be detected in the analyst's goal to depict the model *as if it* were true. The premise of rational expectations states: 'agents form expectations so as to avoid systematic expectations errors in actuality, which implies that they behave as if they knew the structure of the actual economy' (McCallum 1999, 172). The changes of trends in macroeconomics from 1973 to 1998 also initiated upheavals in the theory of monetary policy and central banking. Moreover, they set in motion a compelling shift for central banking and monetary policy towards paying attention to guiding expectations in order to stabilize a paper money standard.

Central banking and monetary policy rules have become a distinct consideration of economists and theorists (Goodfriend 2003). This has provoked new questions, distinct methods, differing viewpoints, and the opening up of further investigation within the scholarly community. The abandonment of the gold–dollar standard was also an abandonment of the theoretical illusion of stabilizing the functions of a currency by referring to constraints as given by a metallic standard. The radical changes for central banking and monetary policy have evolved out of new perceptions and responsibility for price stability.

As history reveals, central banking and monetary policy have had to pass through a long and painful process of learning and reorientation. The experience of high inflation and the responses of central banks in industrialized countries to tighten monetary policy also produced painful and restrictive effects on domestic economies as well as international economies, business cycles, and macroeconomic performance (Muchlinski 2001b). Nations were confronted with a painful mixture of tightened money policy, a high level of interest rates, and tightened

fiscal policy. A new phenomenon in macroeconomic theory and central banking came to the policy-making agenda, emerging in the literature of the 1970s and early 1980s, namely 'stagflation'. The term stagflation was supposed to encapsulate the new relationship of inflation, recession, and unemployment. It also opened up new and distinct directions in macroeconomic theory and in the fields of research on the role of central banking, its targets and instruments.

The evolution of different perspectives on the relation of short-term and long-term expectations was driven by a critique of the adaptive expectations hypothesis, itself identified with Keynesian macroeconomics (Leeson 1998). The radical shift towards a tight money policy in the middle of the 1970s by the Bundesbank of Germany and the Bank of Japan opened up the still-ongoing debate over the role and responsibility of central banks in democratic societies regarding inflation, employment, growth, stagflation, and exchange rate volatility (Muchlinski 1999b). The research into the effect of central banks and their monetary policies on international monetary relations has become more important and better acknowledged. The function of central banks in the economy and their monetary policy strategy, their instruments and methods, appeared to be something in the background, within the domain of a 'temple of secrets' (Friedman 1996). One striking feature of the late 1970s was that central banks had to learn to deal with different kinds of flexible exchange rate regimes and monetary policies. This observation and experience opened up fundamental debates about proper monetary policy strategy in open economies. The central bank's success was established through the interdependence of short-term and long-term interest rates, interest structure, and inflation expectations (Bernanke and Blinder 1992).

As I have outlined, the situation after 1973 was indeed an experimental epoch. It can be described as

> a situation in which the world's leading central banks were responsible for conducting monetary policy without an externally imposed monetary standard (often termed a nominal anchor). Previously, central banks had normally operated under the constraint of some metallic standard (e.g. a gold or silver standard), with wartime departures being understood to be temporary, i.e. of limited duration. (McCallum 1999, 175)

In the 1970s the Federal Reserve Bank pursued a strategy of circumventing demands by the U.S. Congress that were empowered by the Freedom

of Information Act of 1966 (FOIA). The Federal Reserve was accused of hiding behind a curtain of 'mystique' and 'secrecy' by using 'base-drifts'. In the following chapter I will explain how the 'base-drifts' of the Federal Reserve function as a particular strategy of communication.

1.1 'Monetarist experiment' or 'smoke screen'

In the literature we find at least three different approaches to this epoch. An initial interpretation portrays the years from 1979 to 1982 as a monetarist experiment by Paul Volcker, at that time the chairman of the Federal Reserve. Volcker was held responsible for a half-hearted approach to implementing the monetary policy and its subsequent lack of success (Friedman 1982). Moreover, there were negative consequences to this half-hearted monetarist experiment, namely that the Federal Reserve's tightened monetary policy constrained not only the domestic economy of the United States, but also caused a sharp rise in interest rates throughout the global financial market and economy. It led to a painful period of high interest rates, lasting until the early 1980s, and to the debt crises of developing countries.

A second interpretation of this period regards the change to monetary aggregates and money market as a success of the monetarist experiment because important macroeconomic indices, that is, the consumer price index (CPI), GDP deflator, and also the Core price index fell after 1980, while the Federal Reserve funds rate had also been increasing dramatically. However, the question arises as to whether inflation went down because of declared money growth-targeting or from setting of the nominal interest.

A third interpretation asserts that no monetarist experiment had actually been implemented. Because of the influence of inflation psychology, with expectations of high inflation in the air, the traditional strategy of setting nominal interest rates was becoming less acceptable to politicians and the public. Steering market expectations through setting the Federal Reserve funds rate was associated with a Keynesian strategy, whereas focusing on monetary supply or monetary growth rates, respectively, was seen as a monetarist strategy. However, the Federal Reserve had never intended to act upon, and never could have acted upon, the basis of a monetarist 'k-percent-rule'. Volcker viewed this period as 'monetarist experiment in practice'. David Lindsey stated that the Volcker regime change was not identical with a monetarist experiment (Lindsey et al. 2005, 224). Feldstein (1994) analyzed the demanded monetarist strategy in light of the weakened position of the

U.S. dollar since 1973. Volcker's policy intended to reinstall its function as a key currency and to stabilize the hegemony of the United States. The FOMC sought to avoid 'great trouble internationally'. Henry Wallich, for instance, stated, 'as the Chairman has pointed out – he gets this question again and again and we get the same thing in the press and in criticism at home and abroad'.[1]

I would like to add some further information regarding the third interpretation given above. Volcker took office as the chairman of the Federal Reserve on August 6, 1979, at a moment in the history of the Federal Reserve which is identified in the literature on central banking and monetary policy as a significant epoch (Volcker/Gyothen 1992).[2] The Federal Reserve's shift towards a targeting of the monetary growth rate by steering the non-borrowed reserves in accordance with desired three-month growth rates of M1 and, later, M2, required a quantifying of the total reserves in relation to the non-borrowed reserves. Open market operations, as carried out by the Trading Desk of the Federal Reserve Bank of New York under direction from the FOMC, imply that the Federal Reserve was also dealing with the level of the Federal Reserve funds rate. The crucial point is that the paradigm shift towards the non-borrowed reserve policy could not work without using the Federal Reserve funds rate. The assessment of the borrowing reserves and its prospective path was discussed regarding the implications for the Federal Reserve funds rate (see for instance FOMC transcript, conference call, June 23, 1983). 'The Federal Reserve funds rate was not ignored; it was used as an indicator of the accuracy of reserve estimates' (Meulendyke 1998, 50).

The Federal Reserve did not publicly outline the contingent nature of the new monetary strategy. It was publicly introduced as a targeting of the monetary growth rate by steering non-borrowed reserves. Volcker defended the new technique in press conferences, in the Congress, and in the FOMC meeting. He provided additional remarks in press releases on the conditions of targeting money growth ranges in response to ongoing inflationary development in order to win the battle against inflation. His announcement to the press in February 1980 emphasized the key role monetary growth rates played at the turning point in the FOMC's monetary policy. The message was clear: the Federal Reserve was prepared to fight inflation by controlling the money supply. It was obvious that the crucial element of this new structure for steering the quantity of money would be to quantify the money supply while the amount of money demand remained unknown.

In the FOMC meeting of August 1979, Volcker emphasized that the FOMC had no other choice while high inflation was expected:

> We do not have a lot of room for maneuver and I don't think we want to use up all our ammunition right now in a really dramatic action; I don't see that the exchange market or anything else really requires that at the moment. Certainly dramatic action would not be understood without more of a crisis atmosphere than there is at the moment. Ordinarily I tend to think we ought to keep our ammunition reserved as much as possible for more of a crisis situation where we have a rather clear public backing for whatever drastic action we take. (FOMC Transcript, 8/14/1979, 22–23)

Under Chairman Volcker, the Fed also sought to diminish congressional criticism through anti-inflationary strategy. By emphasizing a focus on the money supply based on money growth rates and aggregates, the 'monetarist experience' was in fact 'atmospheric' lip service (Lindsey et al. 2005, 229). The aim of the Federal Reserve was primarily to rebuild price stability. Volcker outlined it:

> We could well end up by exceeding the targets for the year, after making a hullabaloo about this change in technique. And we could run into a reaction that at that point would be adverse. So there are advantages, disadvantages, and risks on all sides of this equation. (FOMC Transcript 10/06/1979, 9)

The Federal Reserve press release of October 6, 1979, emphasized control over the money supply. With the declared strategy of retreating to monetarist principles aimed at targeting the monetary growth rate by steering the money supply, the Federal Reserve tried to regain its credibility. The FOMC's target path for the monetary aggregate was to be designed in terms of the quantity of money, or a monetarist approach to central banking. Volcker emphasized it further in his first Humphrey-Hawkins testimony on February 19, 1980. In 1978, the Full Employment and Balanced Growth Act, that is, the 'Humphrey-Hawkins Act', bound the Federal Reserve to monetary targets one year hence. This commitment has been criticized in the literature because of its rigidity:

> If anything, the policy mistake of the late 1960s and 1970s is that actual monetary policy followed the Taylor rule, too closely! Rather than follow the Taylor rule, policy should have been considerably

> tighter. Given the mistake of following the Taylor rule in the 1970s, the deviation from the Taylor rule in the early 1980s and the policy tightening associated with the Volcker disinflation was an appropriate response to the inflation problem created by following the rule. (Orphanides 1999, 19)

The transcripts of the meetings from 1979 to 1983 throw light on the debates in the FOMC regarding the new monetary procedure:

> Against this background, the staff had been directed to prepare memoranda on a package of possible actions designed to show convincingly the Federal Reserve's resolve to contain monetary and credit expansion in the U.S., to help curb emerging speculative excesses, and thereby to dampen inflationary forces and lend support to the dollar in foreign exchange markets. Such a package might include actions on reserve requirements and the discount rate; in addition, the staff had been asked to analyze the implications of a possible shift in Federal Reserve Open Market Committee procedures, whereby the Desk, in its day-to-day operations, would operate more directly on a bank reserves, rather than a Federal Reserve funds rate, target. (BOG Minutes, 10/4/1979, 1-2, in Lindsey et al. 2005, 201)[3]

The Federal Reserve's declared new monetary targeting was not only a quantum leap back to the past, it was a return to rethinking monetary policy in terms of the gold standard 'rules of the game' in order to solve the nominal anchor problem which confronted the U.S. dollar. The Federal Reserve had lost credibility with the public in the domestic economy amid higher prices and continued price acceleration, while at the same time confidence abroad was lost from perceived failure. This consideration was put forward by Emmett Rice:

> First of all, the psychological impact of a change in operating technique will be strong. I think it will be strong not only in domestic markets but also in foreign markets. In my view the foreign markets will read such an announcement as an expression of our determination to control the money supply, and that will have salutary effects. (FOMC Transcript, 10/06/1979, 22)

The Federal Reserve tried to present itself as a firm supporter of an anti-inflationary policy. It organized new political networks, such as the Shadow Open Market Committee, and made certain arrangements

with some of the supply-side thinkers in Congress to defend its own independence as a central bank. Amid controversy, the FOMC discussed the monetarist approach to the central bank's action and the consequences of setting the nominal interest rate in the short run. The FOMC considered specifying desired short-run growth rates for M1, M2, and other monetary aggregates, which were then to be structured for the associated non-borrowed reserves and monetary base.

Volcker portrayed the switch towards a monetary target as being a 'new technique' in order to let the public and the market know that the Federal Reserve Board stood ready to control inflation. This 'new technique' implied new wording, an 'alternative language is also provided for placing main emphasis either on monetary aggregates or on money market conditions' (Bluebook, March 1979, 17).

Volcker declared optimistically that this new technique would also build in a mechanism to guide interest rates in the direction the FOMC wanted:

> The ... possibility is a change in the emphasis of our operations as outlined in the memorandum that was distributed, which I hope you've all had a chance to read. That involves managing Desk operations from week to week essentially, with a greater effort to bring about a reserve path that will in turn achieve a money supply target – which we have to discuss – recognizing that that would require a wider range for the Federal Reserve funds rate and would involve a more active management of the discount rate. And of course the question of reserve requirements and the discount rate change at this point are relevant in that context too. (FOMC Transcript 10/06/1979, 8)

However, doubts remained on the agenda of the FOMC meeting concerning the new technique and how it would influence the Federal Reserve funds rates, the various interest rates in the money market, and inflation expectations. Wallich, for instance, considered the relation between the procedure of money supply and interest rate movements:

> Upward we can control [through] money supply. We're aiming at the tight money supply and that raises interest-rates – or that is what we [are talking about]. But downward has a totally different implication. It involves a signal that we've switched policy and the markets are going to respond accordingly. ... But we need to watch this strategy in terms of what it produces for interest rates and for the exchange

> market so that we don't get surprised by interest rate movements when they could be harmful. (FOMC Transcript 10/06/1979, 19)

Volcker responded that the movement of interest rates, which depends upon the money supply, can neither be anticipated nor controlled:

> Let me just make a couple of comments. I'm not sure it's self-evident that in interest rate terms the new technique is stronger. It may or may not be, depending upon what happens to the money supply. I think that is inherent to the new technique. We will never know the answer, no matter how long we talk, to what the money supply actually will do in coming months. (FOMC Transcript 10/6/1979, 20)

The debate over the adequacy of the new monetary operation, which dominated the agenda of the FOMC meetings between 1978 and 1982, can be headed under central questions, such as the following:

1) How will the banking system make its decisions on liquidity management and excess reserves, and how will this influence interest rates in money markets?
2) Will the new strategy of money supply by operational monetary targets enhance or minimize the uncertainty in the market?
3) Is the new strategy an adequate approach to rebuilding the credibility of the Federal Reserve System?
4) What consequences for the United States and the U.S. dollar can be anticipated regarding domestic and foreign markets?

Volcker pointed out the advantages of 'triggering a faster response' in adapting money supply in the event the economy changed. The outstanding advantage would be that the new technique would be better understood by the market, public, and banks.

Even prior to taking office as chairman, during his time as vice chairman of the Fed, Volcker regarded the new perspective on monetary aggregates – even without precise numerical targets – as the most convincing strategy in times of high inflation expectations:

> I don't think that [money] target itself, though written in our records, is written in heaven, given all the uncertainties that we had when we set it. ... [T]he exact level of the aggregates isn't quite as important to me as the movement on the funds rate. I'd like to make some gesture there. (FOMC Transcript, 3/20/1979, 28–29)

The assumption that by focusing on monetary aggregates the FOMC would also be successful in guiding the economy towards price stability was then repeated by Chairman Volcker:

> Let me try to describe the so-called new system, as I understand it, in an unprejudiced way. ... The base theory of this procedure is that the committee could decide – in this case only through the end of the year – on some monetary supply targets. ... Now, our concept of the process is that those money supply figures that were chosen would be converted into a reserve base number. (FOMC Transcript, 10/6/1979, 24–25)

Volcker admitted that the exact definitions of total reserves, borrowed, and non-borrowed reserves, might be neither convincing nor necessary. Which target should be used? Total borrow? Do we have one reserve target or 'multiple targets'? These and similar questions were put on the agenda of meetings and seen as steps towards the Fed's goal of winning the battle against inflationary expectations. A few months later, Volcker asserted that while the total reserves are not controllable, the non-borrowed reserves are controllable and, hence, were the focus of the new strategy (FOMC Transcript, 1/8–9/1980, 16). In a broader sense, the new technique was declared a new method in decision-making procedure:

> [S]uppose we happen to put a lot of weight on the current projection of the money supply and pick figures that would closely coincide with that. We would then provide, making some assumption on the level of borrowing that seemed to be consistent with the level of interest rates that presumably laid behind the projection of the money supply in the first place – we can't avoid interest rate assumptions the way these things are done – non-borrowed reserves along that path. (FOMC, Transcript 10/6/1979, 25)

Volcker defended the new technique as a means of rearranging the basis of the entire decision-making process of the FOMC, setting the Federal Reserve funds rate in a gradual manner:

> We used to operate with very tiny changes in Federal Reserve funds rate from time to time, or between meetings certainly, and not very large ones even at a meeting. There is no doubt that we have changed; in my opinion, the emphasis is quite different now. (FOMC Transcript 1/8–9/1980, 64)

Furthermore, another advantage was explained: the decision would be made 'in terms of money supply', not in terms of 'interest rate music' (FOMC Transcript 1/8–9/1980, 64). The Feds declared that a shift from concepts of interest rate policy towards monetarist concepts like monetary aggregates or monetary markets would be understood by the public as signal words towards anti-inflationary policies and should therefore direct expectations of inflation downwards. Lindsey et al. (2005, 191) stated, 'This nuance was a significant issue in the minds of many FOMC participants.'

Volcker mentioned several of the disadvantages as being noteworthy. However, he linked these disadvantages to particular cases which could occur, but not to the new technique in general. He specifically pointed to three particular disadvantages: a) the current fragility of financial markets; b) the unexplained determination of money demand and money supply; and c) uncertainty regarding the new monetary operations.

Because of the fragility of the financial market it was presumed that the new technique would minimize the high volatility of the funds rates. Volcker addressed this with several considerations:

> The other element, of course, is that we are not dealing with a stable psychological or stable expectational situation by any means. And on the inflation front we're probably losing ground. In an expectational sense, I think we certainly are, and that is being reflected in extreme volatile financial markets. (FOMC Transcript 10/6/1979, 6)

Volcker expounded further:

> My feeling was that by putting even more emphasis on meeting the money supply targets and changing operating techniques [in order to do so] and thereby changing psychology a bit, we might actually get more bang for the buck. By that I mean our having a more favorable impact on psychology and perhaps a more favorable impact on banks by introducing a little uncertainty per basis point of rise in money market rates than would be possible through the traditional method. (FOMC Transcript 10/6/1979, 8)

This view was supported by another member of the FOMC, Emmett Rice. The new technique would lead to a 'new uncertainty' which was judged to be welcome. The new uncertainty was interpreted as a way of 'cooling down speculative actions and inflationary expectations'. Rice argued in favour of letting the FOMC work against markets. He also

mentioned some risks of the new uncertainty and of this way of acting against the market. Nevertheless, he judged this to be insignificant compared with the advantages:

> I think that if we moved to a technique where we decide what the money supply should be – and we operate directly on the reserve base to get as close to the level of aggregates that we want – we would stand a better chance of producing the kinds or results we would like to see. The good thing about moving to this operating technique is that, contrary to some of the views that have been expressed, we introduce a new uncertainty into the market. I think that's a good thing. The new uncertainty will have the effect of cooling some of the speculative activity and perhaps have an impact on those demands for credit that are based purely on inflationary expectations and on the assumption that money will always be available at any level of interest rates that the Fed tries to establish. (FOMC Transcript 10/06/1979, 22)

The members of the FOMC discussed the fear that the banking system seemed inclined to avoid debt. It would create high liquidity or excess reserves instead of lending money. This could then undermine the goals of the Federal Reserve. A further crucial measure was the setting of the level of non-borrowed reserves which were to be taken as the average of borrowed reserves in recent weeks and subtracting them from the total reserves: '[A] serious disadvantage that has discouraged policy-makers from entertaining such policies in the U.S., however, is the unpredictability of velocity that at times decouples stable money growth from stable income growth' (Orphanides 1999, 32).

With respect to the unexplained determination of money demand and money supply, Wallich drew parallels between the 1930s and his era, the 1970s. He admitted not knowing what the FOMC in the 1930s really wanted to do. The majority of the actions of the FOMC failed at that time because the commercial banks had avoided bearing the risk of lending, having built up high liquidity reserves. The FOMC was powerless. The consequences were a sharp increase of interest rates in the money markets followed by a recession. According to Wallich, these seemed to be analogous to current circumstances. He raised some doubts and objected to the optimism with which the new technique had been introduced in the 1970s. He referred to current criticisms from home and abroad, and explained that reliance on the new technique had been accompanied by neither a common support nor understanding, but

rather by the fear that the United States was returning to the 'rules of the game', that is, to the gold standard and its failures (FOMC Transcript 1/8–9/1980, 7).

Volcker welcomed hearing these criticisms and differing opinions during the FOMC meeting, stating it was necessary to achieve more clarity on the new technique. However several objections remained on the agenda during the following FOMC meetings. Some objections dealt with the presumed inherent relationship between money supply and the movements of interest rates. Other objections were concerned with the interplay between changes of the non-borrowed reserves and its effect on the interest rates in the money market, which were still unexplained. Other criticisms being raised addressed the imprecise definitions involved, the demand functions of the borrowed, non-borrowed and excess reserves and the attempt to calculate each with numbers in order to use them as targets.

Mark Willes expressed his reservations regarding the reaction of the public and the press:

> I'll start out by saying that I don't pretend to understand the procedures, so my comments are probably way off the mark. But the discussion fascinates me. It strikes me very much like the discussion one reads in the paper each morning where people are explaining what happened in the stock market. They always have some specific reason for why the stock market did what it did. I don't think we really know how all these demand functions – for excess reserves, borrowed reserves, non-borrowed reserves – are changing in the short run. ... I feel very [un]comfortable with the situation where we think we can operate on a reserves basis the same way we were operating on a Federal Reserve funds rate basis. I think the two are very different kinds of procedures; we can't move from a federal funds target to a reserves target and make all these very refined calculations and adjustments. (FOMC Transcript 1/8–9/1980, 8–9)

The demand for exact definitions and greater clarity on the new technique – as outlined in the quote above – also underlined the need to step beyond traditional concepts and definitions. Uncertainty was not only in 'the air' because of the expectation of rising inflation but also because of a new terminology. The FOMC changed its technique by creating new definitions of monetary aggregates (for instance M1, M1-A, M2, M2-B), details of which the money market lacked understanding. Additionally, the FOMC itself did not know if and how the markets

understood the new technique. Therefore, an overall lack of common understanding was 'in the air'. At this point, what function could a money growth target have, given the uncertainty of projections and the absence of a clear path? Regarding the procedure of judgment under uncertainty, Volcker stated:

> We live in an uncertain world. And in view of fluctuating projections regarding the trend in the money supply, our first point of judgment would arise – let's say particularly in the present circumstance – because we might get some ease in the money market immediately if we did nothing but follow the path week by week. If we thought we were going to have trouble later because the projection [has money growth] going above [our targets], we would under-supply reserves in the current week to provide some assurance that we're going to cope with the fluctuation later and not have borrowings running ahead of what we'd assumed. ... As the borrowing fluctuates, they would themselves be reflected in interest rates. (FOMC Transcript, 10/6/1979, 25)[4]

Since the problem of inflation still dominated public attitudes and attention, the approach to the new monetary strategy was criticized by the public and economists. Greenspan asked 'whether, if unemployment begins to climb significantly, monetary authorities will have the fortitude to "stick to the new policy"' (*Wall Street Journal* 1979). The historical background of this epoch was the experience of stagflation in most of the industrialized countries, which led to theoretical upheaval and transformed key premises, for instance to the Rational Expectations Hypothesis (REH) (Mayer 1997; Mishkin 1995).

According to the history of macroeconomic theory, we observe that while the macroeconomic literature was mainly concerned with the REH and the 'Lucas-Critique', the literature on the international monetary system was focused on the nominal anchor by outlining different frameworks of international monetary coordination, that is, coordination of nominal interest rates (Muchlinski 1999b). The so-called triumph of the monetarist view over the Keynesian view at that time was primarily based on attributing blame to the Keynesian view and interest rate policy. The signal given by setting the nominal interest rates was interpreted as being misleading to market participants and should have been replaced by a specific signal, that is, a number of the quantity of money, in order to stabilize inflation expectations. The Federal Reserve was accused of having used the Federal Reserve funds rate as

an inappropriate operational target, which encouraged a repeated overshooting of monetary objectives (Meulendyke 1998, 49).

The orientation towards monetarist theory and the vision of steering monetary policy by monetary aggregates was attributed to the spirit of this monetarist 'counterrevolution'. According to the third interpretation, the Federal Reserve had never pursued the monetarist view, since it had already guided monetary policy by setting nominal short-term interest rates. In the literature, the conclusion is that the Fed could not avoid setting the nominal interest rate in order to implement its monetary policy.

Of course, this interpretation is supported by Keynes. In the 1930s, Keynes described monetary policy as follows: 'The banking system has no direct control over prices. ... Nor has it, in reality, any direct control over the quantity of money; ... the governor of the whole system is the rate of discount' (Keynes, 1930, 189). By that time Keynes had already worked out the interdependence of interest rate policy, monetary policy, and exchange rates – four decades before any monetarist attacked the Keynesian theory:

> The short-term rate of interest is easily controlled by the monetary authority, ... because it is not difficult to produce a conviction that its policy will not greatly change in the very near future, and also because the possible loss is small compared with the running yield (unless it is approaching vanishing point). But the long-term rate may be more recalcitrant when once it has fallen to a level which, on the basis of past experiences and present expectations of *future* monetary policy, is considered 'unsafe'. ... (Keynes 1936, 203).

This view is reiterated precisely in the modern view of central banking regarding central bank practice. In the 1970s, the Keynesian view was accused of being an anomaly of macroeconomic theory. Blinder emphasized the importance of interest rates in that period of history, which is also true for monetary policy today because the pervasive uncertainties that surround monetary policy cannot be discussed in terms of the rational choice paradigm (Blinder 1998, 25).

The Federal Reserve 'monetarist experience' was in fact a new approach to the changes of its communication policy. Beyond the new commitment based on the Humphrey-Hawkins Act it was remarkable that the FOMC repeated its efforts to restore a non-inflationary base for economic growth in its statements and releases to the public. 'Was Volcker "a great communicator"?' inquired Lindsey et al. (2005, 227) in

their study. The answer is that Volcker initiated a new strategy of information policy which undoubtedly generated another mode of communicative interaction between the FOMC and the markets.

Although the Federal Reserve cannot be described as 'a paragon of community' (Lindsey et al. 2005) or a paragon of clarity, the textual evidence I present in this chapter shows that new definitions and terminology as well as the FOMC's own considerations of whether and how the public understands what the FOMC is doing or talking about, were the key focus of that new technology. The citations in this chapter are to be read as examples of a very significant epoch of the FOMC's work. The FOMC was concerned with the creation of new definitions and concepts and a distinct approach to a deeper understanding of a highly complex and discretionary monetary policy. The controversy about following a rule or rules based monetary policy was more the focus of the public's commentary than of the sessions of the FOMC itself, because the need to judge distinct situations was uncontested. Also, the FOMC acknowledged discretionary elements of the new technique inevitably connected to it, while the public seemed to expect the new technology to be based on a rigidly fixed rule. It should be noted that the term 'rule' was first of all associated with the 'rules of the game' of the gold standard, that is, with a particular exchange rate regime and monetary experiment in the 1920s and 1930s.

The meaning of the term 'rule' has changed dramatically since then and, in particular, as a result of different uses of the term (Issing 1996). Lindsey et al. (2005, 222) emphasized that the term 'rule' did not always mean what it means today – the Taylor rule or Friedman rule for instance. Apparently Volcker did not use the term 'rule' in the traditional meaning, which might have contributed to the initial widespread confusion in the market. However, Volcker did not provide another definition. He made it clear that following a rule implies the need to base judgments on different circumstances or situations. It is important to acknowledge that the FOMC created the meaning of its new terminology, not new technology, via several adjustments to its implementation. The FOMC transcripts from 1979 to 1983 deliver interesting examples testifying that Volcker responded as cautiously as possible to certain demands for exact or numerical definitions.

The FOMC under Volcker introduced its new technique by an information policy which was itself under construction or should be seen as experimental. It published testimonies, including the speeches of the board members and the Reserve Bank presidents. It opened up new discussions on central banking and monetary

policy in the Humphrey-Hawkins Act. It provided staff reports, bulletins, and articles to the public, and gave media interviews. It initiated a new mode of communicative interactions: 'Officials of the Federal Reserve Bank of New York held separate meetings yesterday with reporters and securities dealers in an effort to clear up some of the confusion surrounding details of the Federal Reserve's anti-inflation techniques announced Saturday. The Fed doesn't plan to be 'rigid or mechanic' in pursuit of bank-reserve targets (in Lindsey 2005, 205).

> 'This may cause some die-hard monetarists to subdue their elation at our change in approach and recall their congratulatory message,' he said. ... When the reporter asked which rates the public should watch for clues to Fed thinking, Mr. Sternlight replied: 'I'm not sure I have a ready substitute to proffer at this point'. He emphasized that 'we're still very much experimental' at this stage. Mr. Sternlight said one key figure the Fed would pay attention to is 'non-borrowed reserves'. But he emphasized that the Fed won't rely exclusively on this and plans to remain flexible in its approach. (*The Wall Street Journal*, October 10, 1979; in Lindsey 2005, 205)

In subsequent interviews, the FOMC avoided specifying rules or definitions of its new technique. Through such conduct, the FOMC obviously disappointed the expectations of market participants because the market had expected to receive exact rules or numerical targets on which the new technique would be based. The opinion arose that the FOMC was trying to play a game against the market in order to fool it. Market participants accused the FOMC of not being predictable:

> 'Anybody looking for a rule of thumb is going to be frustrated', the official said in an interview that sketched a picture of a more flexible – and probably tougher – Fed. 'There are still going to have to be policy judgments made', the official said, indicating the central bank 'isn't going to trap itself by following any rule'. He said the Fed will try to steer between the 'two extremes' of its old practice of inching the Federal Reserve funds rate up and down and 'letting the funds rate go anyplace forever'. (*The Wall Street Journal,* October 10, 1979; in Lindsey 2005, 206)

Lindsey argued that the Federal Reserve Bank began its transparency policy with that monetarist experiment. The question of how and if the

public understood what the new technique implied was placed on the agenda of the FOMC.

Regarding the bond market, the banking system, and their endowments with new credits, Volcker mentioned some restrictions on the bond market and also restricted the access of some of the market participants. He added that a lot of confusion and uncertainty in the markets is engendered by different definitions and concepts of monetary growth rates, and 'all that measures' of reserves and monetary aggregates (FOMC Transcript 2/4–5/1980, 45). Volcker suggested submitting to a press briefing in order to explain the changes of the various definitions in pattern, but this was 'not to give the targets' itself (ibid). A discussion of numerical seasonal targets should not be published. 'If policy fails, we can always revise the seasonal adjustment factors for a while! [Laughter]' (ibid).

Other members of the FOMC supported Volcker in his view that the monetary targets – that is, the numerical targets for M-1A and M-2B – were much more important to explain to the public than the projections of the borrowed and reserve targets. Volcker considered the latter in a more technical way and proposed defining them only in a technical sense. On this point, Bob Black referred to another crucial aspect concerning the discrepancies of private forecasts and the forecasts of the FOMC regarding the prospective level of the Federal Reserve funds rate (ibid). He spoke of the problem that the economic outlook expected a more recessive economic development. The forecast of the Federal Reserve funds rates of 13 percent by the FOMC and of 10 percent by private institutes underlined the distinct views and expectations on the economy both had.

Additionally, John Balles argued for the need to give more attention to the public's perception and to try to minimize these differing views between the private sector and the FOMC via a change in information policy (ibid). He referred to the rise in long-term bond yields as an important indicator of expectations of rising inflation in the market. He argued for the need to face public reaction to the current FOMC policy in order to gain greater clarity on it. The FOMC should figure out if and how the public shared the view of the FOMC regarding the economic outlook, employment, prospective interest rates, and inflation expectations. Balles argued the public's understanding of what the FOMC was doing, or going to do, was of high relevance to the success of the new technique. He also suggested that a broader range of the monetary growth target would provide the Federal Reserve Bank with greater flexibility in its responses to market reactions. The FOMC

needed to face the public reaction because:

> The public pays more attention to what we do than to what we say we are going to do. (FOMC Transcript 2/4–5/1980, 48)

The debates over how market participants perceived and understood the new technique were key issues in the FOMC transcripts.

Larry Roos, for instance, argued in favour of greater openness and a distinct information policy leading to a more flexible response by the market. Market participants did not understand and were hesitant to act or commit themselves to a decision. Roos recommended producing a publication in order to support the market's understanding of what the Fed was doing or going to do:

> I wonder if some of the lack of dynamism or some of the sluggishness in this whole process might not be a reflection of the fact that large segments of the markets aren't quite sure exactly what we're doing. That leads me to the question ...: What would happen if we specifically and publicly described what our paths are – or at least some of our paths – so that the market could adjust to what they know our game plan really is instead of feeling that there's some vague thing going on that they're not sure of. Their reluctance or lack of reaction may be due in part to the fact that people don't want to stick their necks out in the markets until they really know what our reserve path is or what our monetary base path is. What are the negatives to defining those things publicly? (FOMC Transcript 1/8–9/1980, 9)

Volcker responded with caution to these requests for greater openness and a switch to another information policy. He expressed doubts that a disclosure of information – the adequacy of which the FOMC was still debating – would be very edifying to the public. To put it another way, he rejected the pretence of clarity or exactness on issues which were anything but exact or clear at all. He tried to balance the different arguments and considered different perceptions. He accepted some suggestions made about the public's concern over inflation and how that concern differed from the view of the FOMC. He also admitted that he perceived 'an immense amount of confusion in the minds of the public' (FOMC Transcript 4/22/1980, 22):

> Let me distill a bit what I think I'm hearing and what I'm thinking. The big change we've had – though we've had a lot of changes since

> the last meeting – is that we certainly have some evidence of economic decline that we didn't have before. I for one still think it's a little premature to make very conclusive judgments about what kind of a recession we're going to have. I'd say also that it takes a little while to meet the definition of a recession. We've been fooled before. (FOMC Transcript 4/22/1980, 21)

Volcker behaved with the utmost caution when it came to traditional and new definitions and concepts. Since the crucial economic indicators – like tax refunds and prospective consumption, the car business, imports and exports, and the credit situation – were seen as an atypical pattern of economic performance, he pointed to the uncertainty surrounding the FOMC's decision-making process. Nothing could be judged as familiar or known for a long time:

> All I'd say is that there is some uncertainty, particularly when one looks at the other side and the inflation side. Two months ago everybody was going for leather and wanting to buy in anticipation of inflation; I think that mood has changed. ... And looking at a longer-term perspective, there's no question in my mind that in considerable part inflation is what got us into this dilemma. And it is recognized as a major problem. ... In that sense I don't think we're in a situation where there's any course of action that is risk-free or even in some sense a 'winning' course of action because there's a lot to be lost by a resurgence in inflationary expectations and there's a lot to be lost by accelerating the recession; and I'm not sure that there's any real room between those two contingencies. It has been implicit in everybody's comments that we have to keep our eyes on both [inflation and recession] as best as we can. (FOMC Transcript 4/22/1980, 22)

The open questions regarding these unknown patterns of economic indicators led to extensive contributions in economic literature, indicators later defined as 'stagflation' – the coincidence of inflation and economic stagnation. This new phenomenon occurred at the time the 'monetarist experiment' was undergoing implementation. It was not only hard to figure domestically in the United States, but also internationally. Neither the FOMC nor Volcker could have known what the domestic or international markets were anticipating at that time because all industrialized countries were confronted with this new problem.

The economic indicators represented no overall pattern. Inflation, for instance, had risen during the previous months, and also indicators

of recession had been significantly driven upwards. Volcker referred to the economic indicators as 'attitudes' which fluctuate 'rapidly'. It was precisely these unexplained attitudes and behaviours of the financial markets which created additional uncertainty in the decision-making procedure:

> I do have the feeling in listening to some of the different economic forecasts and comments that our staff, which is sometimes accused of being Keynesian, feels more constrained by the money supply assumption than more monetarist oriented people. And that accounts for some of the differences in view. Assuming that we're all intelligent people around the table, [given the] differences in outlook that have been recited, I don't see how anyone can come to any opinion other than that there is a great deal of uncertainty in this forecasting business. (FOMC Transcript 2/4–5/1980, 44)

Volcker raised the prospect of international problems which were of concern to the central bank's responsibilities because they were beyond the scope of monetary policy and, hence, the FOMC. He said:

> In terms of what we have accomplished or have not accomplished in monetary policy in recent months ... and have suffered a grievous blow from everything that has been going on internationally – whether you're talking about oil prices, or Iran, or Afghanistan and concern about defense spending. There is nothing much we can do about that, but I think in some sense we're back to square one or worse in terms of the public's concern about inflation. ... In fact, I don't think we can deal with the risk of a downturn and ignore the inflationary side, because they're part of the same parcel in some sense. (FOMC Transcript 2/4–5/1980, 44)

The Federal Reserve was aware of both higher prices and unmistakable hints of a recession followed by a higher level of the Federal Reserve funds rate. The FOMC's conference on March 7, 1980, threw light on the procedure of agreement to raise the upper limit of the Federal Reserve funds rate while the lower limit would remain as it was. The divergences were assigned to the lower limits. While some members voted to enlarge the range for the movement of the Federal Reserve funds rate from 14 to 18 percent to the range of 11 to 18 percent, others argued this range was verging on the absurd. The lower limit of the Federal Reserve funds rate indicates the willingness of the FOMC to keep the monetary aggregate

in line with the posture of the monetary aggregate targets. It was argued that 14 percent rather than 11 percent was a proper lower limit. With a recession 'in the air', this level of the Federal Reserve funds rate also threatened a highly probable credit crunch and higher unemployment. Chuck Partee at the FOMC conference call in March 1980 argued:

> It has called for higher rates and could call for still somewhat higher rates in the period to come and we ought to have room to move if that's necessary. Looking a littler further ahead, as the financial panic leads to deep recession I think we'll need considerably lower rates and we ought to keep open the room for doing that in order to get the aggregates that we've said we were going to get. (FOMC Transcript 1980/03/07 conference call, p 6)

Volcker responded:

> We'll strike that last comment – [the 'recession'] word in that last comment. (ibid)

According to the debate in the FOMC the increase of the Federal Reserve funds rate would underline their responsibility for an anti-inflationary policy. The effects on the interest rates and the recession in the United States as well as in all industrialized countries were significant in the following month (see Lindsey et al. 2005):

> The Federal Reserve took short-term rates from around 11 percent in September 1979 to around 17 percent in April 1980. This was the most aggressive series of actions the Federal Reserve has ever taken in a short a time, although the roughly 5 percent increase in short rates from January to September of 1973 was almost as large. (Goodfriend 1997, 13)

Against the historical background outlined above, the Federal Reserve had started to combine the new monetary technique with a new commitment to report its decision to the public. The Federal Reserve tried to combine the new commitment with the strategy of 'base-drift', that is, of changing concepts and definitions to be reported to Congress. A 'base-drift' emerges if there is a deviation from the monetary policy goal. The public had already been confused by the declared new monetary procedure, therefore the new commitment to reports based on changing definitions led to a greater uncertainty and confusion.

However, I think the textual evidence of the debates in the FOMC do not support the interpretation that the FOMC deliberately tried to confuse market participants by its 'base drift'.

While Poole proposed the Federal Reserve should enlarge the corridor of the monetary target in order to avoid big jumps, Goodfriend identified the roots of the 'base-drift' as a credibility problem of the Federal Reserve (Goodfriend 1989; Poole 1996). The Federal Reserve was irritating the public. In contrast to Goodfriend, Charles Walsh diagnosed that 'base-drift' was an accurate answer to the monetarist view of monetary policy which systematically ignores changes in money demand (Walsh 1986). Only within a monetary view is such a 'base-drift' credible because it is required:

> The most likely explanation of these changes is political rather than technical. The Federal Reserve had decided that inflation had reached crisis levels and had to be controlled at almost any cost. As many authors have noted, the new operating targets were a useful smokescreen that obscured the link between the Federal Reserve's actions and the painful increases in interest rates. (Bernanke/ Mishkin 1992, 12)

Nevertheless, the details of 'this useful smokescreen' (ibid) remained obscure for reasons due not just to the complexity of the monetary technique, but rather to the lack of knowledge concerning these new techniques which the Federal Reserve itself was confronted with. To declare a monetary growth rate strategy and also declare the replacement of the Federal Reserve funds rate by the non-borrowed reserve was without doubt a clear goal, but there was no way to implement such proposed policy rules (for reasons outlined in the previous pages). Although it is argued in the literature that the Federal Reserve did not explicitly explain the details of its declared monetary strategy, it should be noted that the Federal Reserve's information policy was as precise as it needed to be regarding the function of the Federal Reserve funds rate which was not replaced.

With regard to the question I raised at the beginning of this chapter, 'monetarist experiment' or 'smokescreen'? Brunner (1981) described the period of the Federal Reserve, using the terms 'mystique', 'secrecy' and 'central banking as an esoteric art' to point out its missing ability or willingness to remove the veil of deception. According to Brunner, the central bank's mystique arises out of its avoidance of clear descriptions of communicative interaction with financial markets. Against the

historical background as outlined on the previous pages, the Federal Reserve's information policy was restricted by its attempt to act independently from policy, and its limited knowledge of the newly introduced technique (Muchlinski 2001a).

Lindsey also admitted the existing lack of clarity of the new techniques and methods regarding the concepts needing to be defined and applied in targeting the money growth rate. The terms and concepts were not precisely defined: for instance the concepts of 'rule', of 'discretion', or even 'monetary target', 'monetary aggregate', 'M1', 'M2', and so forth. Lindsey posited that the term 'mystique' is embedded in the monetarist experience and linked to that context. Nevertheless, Lindsey accepted that the Federal Reserve and Chairman Volcker were communicating in an adequate way regarding the difficult tasks of targeting and defining the monetary growth rate by steering the money supply. As the textual evidence suggests, this experimental episode at the end of the 1970s, and the FOMC's inclination to 'monetary mystique' and 'secrecy', were linked to the problem that the FOMC had difficulty anticipating the reactions and the understanding of the public to its disclosed information (see also Tabellini 1987):

> The FOMC argues that the Directive is written in 'terms of art' that are vague and cannot always be accurately interpreted. But this problem could be dealt with by making the language of the Directive more explicit and intelligible. ... The FOMC argues that because it has no experience predicting market response with disclosure of the current Directive, policymaking with disclosure would be difficult. (Goodfriend 2003, 173–189)

The process of working out the meaning and understanding of information requires interaction with the audience to which the information is addressed, for instance the media, analysts, politicians, and agents of financial markets. The audience, therefore, is interested in different information. Whereas politicians are focused on information related to political matters, the analysts pay more attention to information relevant to the movement of certain economic variables.

Greenspan explained that the understanding arises out of the communicative interactions between both inside analysts of the Federal Reserve and outside analysts, that is, key players of the financial markets. The results of this information are used to refine the FOMC model to estimate and judge the likely results of its policy – the understanding and meaning. Greenspan provided a description of 'risk management

policy' by emphasizing that in times of panic, recession, or liquidity crunch, the central bank should immediately lend liquidity 'to all that bring good securities quickly, freely, and readily' (Greenspan 2004, 38). It detracted from the wisdom of the 'open window policy' (Bagehot, 1873), introduced as the iron law of central banking not to act in that way.

Blinder emphasized that whether or not Volcker did pursue the declared targeting of monetary growth rate, 'money-supply targeting can be hazardous to a nation's health' (2005, 4). Blinder argued that Volcker and his colleagues overlooked the fact that the success of money policy depends on a central bank's *interactions with the markets*. Therefore the so-called monetarist experiment could be described as an epoch in which the Federal Reserve Bank was becoming suspect because of contradictions which arose out of its declared strategy, its perceivable – and contradictory – monetary practices, that is, interest rate changes, and also perceptions of all this by agents in the markets, who demanded a consistent explanation of what was going on instead of such a 'wishy washy' strategy.

Blinder (2006, 12) maintained that the metaphor used by Brunner merely depicted a caricature of central banking which encapsulated the key message of that time: 'Say as little as possible, and say it cryptically. Attitudes toward transparency have changed dramatically since then, and central banks around the world have opened up.'

Blinder emphasized that the Greenspan era provided plenty of examples of consistency in the meaning and understanding of the central bank's policy. The central bank let the bond market do its job regarding expected changes in interest rates. Interaction also implies that the market does not intervene, that is, does nothing. In describing Federal Reserve policy from January 1996 to June 1999, Janet Yellen and Blinder once labelled this non-active behaviour, or silence, as 'forbearance'. Although the unemployment rate fell under the Non-Accelerating Inflation Rate of Unemployment or NAIRU rule, the Federal Reserve did not raise the Federal Reserve funds rate. From this it can been seen that remaining passive and silent can be an accurate way of acting and can have greater results than trying to act in the ways described in economic textbooks (Blinder and Reis 2005).

Central banks at times practice not speaking for a while in order to avoid speculation about changes of interest rates (Ehrmann and Fratzscher 2008). These times of selective disclosure policy or relative silence – lasting about seven or eight days – concern the monetary policy issues before the meeting and shortly after the meeting of the Monetary Policy Committee (MPC) of the Bank of England and FOMC

and are described as the 'purdah-guideline'. The authors emphasized that the effect on market variable in the purdah period depends on the characteristics of the last statement in the pre–purdah period and the statements during the post–purdah period. The statements during the purdah period are defined as conditional statements according to the effect measured by changes of the levels of interest rates in the money markets. In other words, the mode of the communication policy of the MPC and FOMC is a *changing one*.

In my view even the terms 'mystique' and 'communication' seem to lack clarity. Whereas Brunner associated 'mystique' with the missing ability and willingness to explain monetary strategy in detail, I would rather propose defining 'mystique' as the central bank's way of communicating with the market in a manner different from what was then expected. We are used to saying 'X is a mystique' because we have no understanding of what is going on, and perhaps we do not want to understand it. The proposition 'X is a mystique' also indicates something that is supposed to contradict our norms. This is also true regarding the 'esoteric nature of the art' of central banking. Therefore, 'monetary mystique' cannot be assigned to non-communication but rather to the view that the meaning should be discovered beyond the context in which the action takes place. The meaning of words or sentences and of understanding is rooted in communicative interaction, or action (respectively non-action) in context. It was Paul Watzlawick and his co-authors who revolutionized thinking in terms of communicative interaction (Watzlawick, Beavin et al. 1967). Their important conclusion is that *it is not possible to avoid communication*. Even if a central bank hides itself behind 'the secrets of a temple' or 'mystique' or 'silence', it nevertheless adheres to a certain kind of communicative interaction or style, because a so-called non-action is also to be perceived as an interaction, that is, the avoidance of interaction. It is additionally important to accept the relevance for economics of this research in order to perceive the differences central bank interactions make and to illuminate the need for shaping a central bank's actions.

To summarize: 'Monetary mystique' refers to the monetarist experiment. 'Monetary mystique' is not identical with non-communication, but rather addresses the view that meaning and understanding do not arise *beyond* interaction with agents of the financial markets and the central bank. Moreover, 'mystique' is not identical with 'secrecy'. 'Secrecy' is important according to the modern paradigm of central banking. As I will outline in the next chapter, the achievement of transparency and credibility can be defined only as a *degree of transparency* or *degree*

of credibility. Therefore 'secrecy' is inherent to both. The terms 'mystique' or 'monetary mystique' coined by Brunner imply the assumption that the meaning and understanding of actions arise *beyond the context of central bank practice*. It is only this assumption that generates 'mystique' or 'monetary mystique'. A central bank which is supposed to act beyond the market has no success. The reason for this is simple: every action or non-action, any decision or non-decision, manifests itself within a particular pattern of interaction. It is not credible, then, to posit that a central bank acts as an isolated institution or with a hidden agenda.

1.2 The new paradigm of the modern central bank

> A central bank is invested with enormous power over the economy; and, if it is independent, that power is virtually unchecked. This authority is a public trust assigned to the bank by the body politic. In return, the citizenry has a right to expect – no, to demand – that the bank's actions match its words. To me, that is the hallmark of credibility: matching deeds to words. (Blinder 1998, 63–64)

This chapter outlines the implications of the modern paradigm of central banks, which can be characterized by the consideration 'matching deeds to words' (Blinder 1998) and 'we do what we say and we say what we do' (Issing). This formulation concerns the evolution of the meaning and understanding of the communicative interactions of central banks within their politico-economic and social context. I should immediately point out that the concern of this book is not, in fact, with questions such as *why*, *how*, *where,* and *when* a central bank should be transparent. Extensive work has already been done on these issues, which need not be repeated here (Blinder et al. 2008; Thornton 2002). To sum up this issue (which has opened up an extensive debate in the literature), transparency should enhance the effectiveness of monetary policy, that is, price stability, growth, and employment. Some authors maintain that the announcement of the Federal Reserve funds rate, being crucial to transparency, enhances understanding of the central bank's strategy and, hence, its credibility with respect to low inflation (Ferguson 2001; Poole 2003). Others argue that communication creates transparency (Bernanke 2004a; Blinder et al 2001; Fracasso et al. 2003; Freedman 2002; Friedman 2003; Jansen and de Haan 2006; Kohn 2005a; Muchlinski 2005; Schmidt 2005; Schmidt and Ullrich 2006).

There are comprehensive volumes in the current literature on the subject of transparency, dealing with its various aspects in great detail. Most are concerned with the considerations of a central bank's information policy regarding the political, economic, procedural, policy, and operational dimensions of a central bank (Cukierman 2002; Eijffinger and Geraats 2002, 2005. Information policy as a crucial component of transparency is also expounded on by authors particularly concerned with forecasting (Berger, de Haan and Sturm 2006; Chortareas, Stasavage, and Sterne 2002; Ehrmann and Fratzscher 2009; de Haan and Sturm 2009; Ullrich 2006). Expected changes in the Federal Reserve funds rate affect the prices of bank loans, bond rates, and mortgage rates and, hence, will in the long-run influence house prices, wages, and expectations about inflation in the economy. Therefore, as a means for an improved information policy, transparency is welcome. A few contributions focus on the institutional framework of central banks and how transparency could improve the efficiency of monetary policy (Amtenbrink 1999; Cecchetti and Krause 2002; Issing 2008).

Since the transparency of a central bank (i.e. an institution) is tied to its objectives and its mandate, the question of *how* a central bank discloses information to the financial markets has been discussed (Poole, Rasche, and Thornton 2002). Some authors draw attention to different forms of articulation, for instance written information, upon which the central bank relies when giving information to the public (Fracasso, Genberg, and Wyplosz 2003). Other contributions focus in particular on the decision-making process, for instance Blinder and Morgan (2005), and Ehrmann and Fratzscher (2005b). However, I will refer to some of these prior contributions because the new paradigm cannot be discussed without them. In my view the consideration 'matching deeds to words' and 'we say what we do and we do what we say' is the *key* concept to understanding a central bank's transparency and communications. This key concept should not be restricted to questions of information policy, but rather includes communicative interacting and understanding. For reasons I outline in this book, I assert that meaning and understanding are rooted in the context, in the mode of communicative interaction. In my view, the new paradigm of central banking implies a compelling need for the development of a theoretical approach to drawing attention to language activities, meaning, and understanding. A central bank signals its verbal participation within a context and reflects the reciprocal relationship with the market, which must be interpreted. Credibility and transparency are connected through the use of language or the way of acting, but not by a supposed

mechanical procedure (Muchlinski 2002a, 2005, 2008). Transparency is linked both to the communicative interactions of the central bank with the financial markets and to the perception of these interactions by agents. Since the concept of transparency is not ontologically definable like the concept of a stone or car, for instance, an institution cannot be transparent *by itself,* given the fundamental research of cognitive sciences. The concept of transparency and the meaning of a transparent central bank are basically linked to a person's perception, which means in terms of the financial markets and central banker, to the *perceived* transparency of the central bank. As Issing (2005a, 504) emphasized:

> [F]or the reality one perceives really depends on how one looks at it. If anything can be learned from Alice's Adventures in Wonderland, it is surely this. ... Buiter is therefore not alone in suffering from cognitive dissonance and bafflement.

I propose to define transparency as a result of verbal and non-verbal interactions and of reciprocal perceived reaction by the central bank and the agents in the market towards the changing parameters of the context. Since transparency is not ontologically definable it always implies an interactive process, dialog, or communicative relation. Therefore, transparency also implies misunderstanding or miscommunication (Dascal 2007). Blinder (2004, 6) argues: 'I will say that a central bank is transparent if its actions are "easily detected", its policies are "readily understood" and its pronouncements are "free from deceit".'

I would like to add that being readily understood requires pronouncements to be expressed in everyday language and not in a coded language. Contrary to a model world, transparency in the modern view of central banks refers to the understanding of verbal and non-verbal interactions. In a mechanical analogy the expectations and preferences of market participants are modelled as being driven by fixed rules and as encapsulated mechanical standards. Transparency and the effectiveness of monetary policy are not results of a deductive reasoning based on the stimulus–reaction of a model world in which the policy ineffectiveness proposition, combined with the premise of the neutrality of money, dominate reasoning. In such an artificial world interaction is not necessary; moreover, pronouncements, language, and communication are meaningless. From the viewpoint of effectiveness and democratic accountability, economic preferences are lexicographic. According to the modern view of central banking, transparency and credibility are rooted neither in model premises nor in deductive reasoning: rather,

both concepts are linked to the mode of action, that is, to the use of language. The Federal Reserve Bank's way out of 'monetary mystique' documents that it has already turned to giving attention to this issue, as Ferguson acknowledged:

> The language indicates the Committee's sense of the balance of risks in the outlook against the background of the Committee's long-run goals of price stability and sustainable economic growth. Specifically, it indicates whether the Committee believes that the risks are 'balanced with respect to prospects for both goals', 'weighted mainly toward conditions that may generate heightened inflation pressures, or 'weighted mainly toward conditions that may generate economic weakness.' (Ferguson 2001, 5)

Transparency is defined neither in absolute terms nor in itself. This concept encompasses different dimensions of central bank practice. There is a consensus in the literature that central banks need to talk about their objectives and methods, that is, forecasts, models, tactics, and decisions. As Greenspan (2001a) emphasized:

> To earn and maintain that trust, the Federal Reserve must communicate to people about what we do and why we do it. Outreach efforts such as this are important because a central bank in a democracy depends on the trust and confidence of the citizenry. These displays represent one innovative example of how the Federal Reserve fulfils its responsibility to reach out and educate the public about the important mission and work of its central bank.

Poole (2003) put it thus – 'How, not whether', and went on:

> It is hardly surprising that central bankers are more talkative than they were just a decade or so ago, and more concerned about how to improve transparency and communication with the market. Perhaps only one issue is settled: Transparency is important but is hard to accomplish because miscommunication is so easy. Clearly, more talk does not necessarily mean greater transparency.

The ongoing discourse deals with transparency as a demanding task for any independent central bank, indeed for any public institution in a democratic society. As far as it concerns the various tasks of a central bank, its goals, methods, decisions, and decision making,

transparency implies attention to the *degree of transparency* which supports the central bank's efforts to be effective and to fulfil its mandate. A demand for full transparency makes no sense to those authors who adhere to the modern paradigm. The step towards a greater transparency is neither a shift towards full or optimal transparency nor towards a simplified view on how a central bank is aiming to exercise its mandate. The road towards transparency implies the continuity of communicative interactions by the central bank in trying to make itself understood and to grasp how the agents of the market understand the information released by the central bank. Issing (1999, 507) has stated that,

> complete transparency of the underlying information set, as well as the thinking and ulterior motives behind central bankers' decision, is logically and practically impossible to achieve. ... This reflects a deeper (philosophical) recognition of the limits of knowledge and the impossibility of providing and communicating anything like a full description of reality: Reality is never transparent. What we see from any one angle is always only part of the picture'.

Issing also shed light on the role of perception and understanding. At this point an informative discourse between Buiter (1999) and Issing (1999) brought to light the awareness that the meaning and understanding of the concept of transparency and accountability is rooted in different views *on how* the institution – the central bank – acts or should act and be regulated in praxis. A central bank is based on constitutive laws. However, as the discourse on credibility and transparency underlines, the performance of an institution cannot be established solely or even mainly through laws. The performance and acceptability of an institution arises from its practices and its social acceptance, hence the interdependence of agents, structures, and contexts which are configured by people's communicative interaction. Referring to Buiter's demand for an enlarged information policy in the European Central Bank, Issing argued:

> [M]ore words do not necessarily mean more information, and more information does not necessarily and by itself contribute to greater clarity. ... Transparency could perhaps best be understood not as an attribute *per se*, but the degree to which we do what we say and say what we do[,] ... whereas accountability means we do what we are supposed to do. (Issing 1999, 508)

Buiter put forward the demand that transparency must be the response to the public's questions and its right to be informed by the central bank. The question remains as to where to draw the line between the public's right to know and the transparency and accountability of an independent central bank. The public's right to know does not reveal *if* or *what* the public actually understands. Although exponents of the modern view have endorsed the development of communication between a central bank and financial markets, they have kept a distance from the view that a central bank should also reveal its intention. Concerning the need to also communicate a central bank's intention, they have argued for caution:

> For stock markets, one argument is that communicating intentions on the future path of interest rates could go a long way toward stabilizing expectations. ... Hence, noting that central banks do not really have any information advantage over markets, we remain agnostic on the desirability of communicating such intentions. (Blinder and Goodhart et al. 2001, 16)

Given this quotation, it should be noted that communication is not tantamount to revealing one's intention. Announcements or communications reveal neither intentions nor thoughts. It does not make sense to insist that a central bank should communicate its intentions – for reasons I will explain in Chapter 2. If one talks about the intention of XY, one has to be aware that the intention is embedded in a context. Intentions are not to be interpreted as mental states. The question then arises: why shouldn't a central bank talk about considerations which are related to this context? The context surrounds the actions of a central bank and also of the market participants. A central bank should aim to share with the market its considerations of the context and its perceptions of the future.

The demand for a greater transparency does not mean that a central bank should act as if in a glass house. Therefore, 'secrecy' is needed – a term inherently connected with 'creative ambiguity' (Blinder and Goodhart et al. 2001, 13; Issing 1999). A major concern of the Volcker regime was to defend its independence against influences by politicians and the public. The FOMC was trying to develop a strategy of communication which was compatible with its need for secrecy. The strategy of 'base-drift' is interpreted in the literature as 'constructive ambiguity', hence as a part of a central bank's strategy to act *through* the market. This strategy can also be described as 'creative ambiguity'.

Lindsey (2005, 229) introduced the notion that 'constructive ambiguity', as linked to the Volcker era, is neither identical with 'opaqueness', nor with 'non-transparent'. At that time, the Federal Reserve experienced how to act with limited manoeuvrability regarding two dominant paradigms of the time: monetarist and Keynesian approaches to monetary policy. Lindsey emphasized that 'constructive ambiguity' and 'mystique' have acquired a particular meaning for central banks as a result of this era. I propose interpreting this as protective behaviour in order to proceed with an institutional task that cannot be implemented if that institution acts as if in a glass house (Muchlinski 2005). I would like to add that the meaning of these terms is linked to certain circumstances. A good example of how the term 'constructive ambiguity' has accrued its meaning can be shown through a reading of the transcript of the FOMC conference call on June 23, 1983. The FOMC had declared that it was targeting the non-borrowed reserves and monetary supply growth rate. The debate in the above conference call was about the current borrowing level, which was higher than expected, and its implication for the Federal Reserve funds rate. However, it was decided not to publish estimations of the borrow level. The central issue of the conference call was whether a required change would be in line with the published directive or not:

> Vice Chairman Solomon ... 'I think it's because we never mention in our record, as I remember, what the borrowing assumption is'.
> Chairman Volcker ... 'Oh no, we would not cite that anyway. It would be some language to the effect that we're operating consistently with a slight increase in reserve pressure. That's all it would say'.
> Vice Chairman Solomon ... 'Okay, if it's not published, it's all right. But if it were to be published, then that would sound like a further increase in restraint and that is beyond what the majority decided last time'.

Volcker made an attempt to balance the considerations of the members of the FOMC meeting regarding the existing and already published directive. As long as suggested changes remained on the bottom line of the directive it was not required to rewrite the directive.[5] Broadly speaking, Volcker preferred to inform the market of the decision-making procedure by way of a 'reconfirmed' procedure, or as based on consultations, because it was important to defend the existing FOMC directive. It was assumed that changes in the directive were interpreted by the public as serious changes and, hence, grave deviations. The FOMC

became concerned about losing its credibility:

> Chairman Volcker ... In that connection, what I would be inclined to do – although it could be done another way – is not, as you say, rewrite the directive because I think this is generally within the scope [of the existing directive]. But I would include in the written record that there was a consultation and that we confirmed that a slight increase in pressure was appropriate.

Regarding the argument of Vice Chairman Solomon, as cited above, Volcker made clear:

> No, it [further increase in restraint] would be stated as consistent with the directive. And we have a directive that says 'slight increase'. All we're doing is consulting about what a slight increase is, in these terms. I think it's consistent with what we've done at times in the past. As I say, we have alternatives all over.

The alternatives – further consultations or a complete publishing – were also discussed and carefully weighed. Volcker was not convinced of the need to go public with a comprehensive pronouncement containing all the details of the considerations, but this did not mean he objected to transparency or communication. Regarding the structures of the arguments put forward on the 1983 conference call, which can roughly be interpreted as being representative of argumentative traits of the Volcker era, I propose that Volcker tried to safeguard the FOMC meetings from the glare of public scrutiny. This strategy might be interpreted as a plea for a degree of transparency.

The Federal Reserve implemented 'constructive ambiguity' as an attempt at setting an accurate interest rate. This echoes the characteristics of the central bank's landscape, that is, uncertainty. However the question of whether 'constructive ambiguity' is a correct or useful response is still open to debate. The roots of 'constructive ambiguity' are found in the Volcker era. For example, the outlined debate at the conference call on June 23, 1983, focused on the need to be as transparent as possible while avoiding absolute transparency. The need for a degree of secrecy, or the plea for a degree of transparency, was mentioned as being essential for the FOMC to implement its strategy:

> Chairman Volcker ... That is my instinct. I don't know quite why I feel that way, but it just seems natural to say we have this under review.

> We have a pretty vague directive, so we're just indicating publicly that we've kept it under review between meetings and reconfirmed the idea of a slight increase in pressure. But the emphasis would be on 'reconfirmed'. (ibid)

Volcker emphasized the importance of informing the market that the FOMC is concerned with issues also deemed to be relevant to the market. He pointed to selective information as a way of letting the market know what the FOMC was debating. However, this strategy was interpreted as ambiguous:

> Chairman Volcker ... Any other comments? In the absence of a comment I will interpret it as a consensus, which is the way the record of the consultation will be written.
>
> Mr. Guffey ... Mr. Chairman. Roger Guffey. Do I understand that what you plan to show publicly is that the Committee met and confirmed the slight firming that has already taken place?
>
> Chairman Volcker ... I wouldn't word it like that way. I would just say that we met, we reviewed the business situation and the strong news that was reported. We reviewed the aggregates and they looked a little stronger. In the light of all these facts, the Committee consensus was to confirm its decision that a slight firming in reserve pressure is desirable.
>
> Mrs. Teeters ... You're not going to take a reported vote on it?
>
> Chairman Volcker ... No, I wouldn't have a vote. It will just be reported as a consensus that a slight firming was consistent with the directive we already have.
>
> Mr. Guffey ... What has already happened?
>
> Chairman Volcker ... Well, in fact, it has already happened, but his. ...
>
> Vice Chairman Solomon ... Well, I must be dense. It seems to me that what you're doing is leaving it open to ambiguous interpretation, which may be just as well. But it could either be a slight firming, which doesn't go beyond the firming that was in the last directive, or it could be a slight additional firming even though it's still consistent with the last directive. Am I correct that it is open to both of those interpretations?
>
> Chairman Volcker ... I think probably so, and I'm not sure I see the damage in that ambiguity.
>
> Vice Chairman Solomon ... I'm not sure either, but I think it is ambiguous. Okay. ...

Chairman Volcker ... Not hearing any other business before the house, we will stop. Thank you.

Vice Chairman Solomon ... Mr. Chairman, your voice fades. The Washington end fades very, very frequently. Maybe somebody ought to take a look at the system again.

Chairman Volcker ... We're going to take a look at the system for various reasons. The more we look at it the worse it seems to get. But we'll try once again.

Vice Chairman Solomon ... Is that the Federal Reserve System or the communication system?

Speaker (?) ... Both!

Chairman Volcker ... That comment refers to the communication system. Okay.

End of the session (FOMC Transcript June 23, 1980).

From today's viewpoint there is a consensus in the modern central bank literature that a central bank cannot disclose all information to the public, or talk about every decision or the decision-making process needed to achieve its mandate. In principle central banks should be transparent about their decisions and the proceedings of monetary policy meetings as well as about their own views of future developments. Transparency and credibility do not focus merely on providing or maximizing information. Since both concepts can only be defined by a *degree of transparency* or *degree of credibility*, then *secrecy* still remains as the inherent implication of both concepts. 'Secrecy' is not identical with 'mystique' for reasons I outline in this section. Secrecy is still required for special issues of central banking as empirical findings have suggested.

A central bank must maintain a degree of secrecy surrounding its relations with the commercial banks and the government. Transparency is only achievable to a certain degree. Therefore, secrecy will always be an inherent factor in the pursuit of transparency. With respect to the experiences of the Volcker era outlined in the previous chapter and above, central banking is seen as an interactive procedure between the FOMC and the financial markets. Therefore I propose to connect 'secrecy' and 'creative ambiguity' with being elementary to a transparent monetary policy. 'Secrecy' and 'creative ambiguity' is an appropriate response to certain confidential information within the financial market and to the need to interact with financial markets.[6]

As already summarized with regard to the modern view of central banking, monetary policy *cannot* be successful as a measured acting

against the market. The success of a monetary policy and the implementation of its mandate depend on a central bank's capability in interacting with the agents in the market convincingly. Therefore, the central bank's way of acting is in practice subject to scrutiny and perception (Friedman 2003). Any change of the Federal Reserve funds rate, that is, the nominal short rate, will change other economic variables with a longer lasting horizon than the market normally focuses on. The monetary transmission channel is driven by the changing expectations of market participants. The focus of central bank transparency must be concentrated on this expectations-building process in order to influence its long-lasting horizon of price stability:

> With a more transparent central bank, we argue, market expectations that are so critical to the transmission of monetary policy – e.g. through the term structure of interest rates, the reactions of stock markets and exchange rates, and wage and price setting – will reflect policy changes better and faster. (Blinder, Goodhart 2001, 2)

Focusing on the expectations-building process also implies investigating the interdependence and communicative interactions between the Federal Reserve Bank and agents in the markets. A central bank's power determines the short-term interest rate, whereas the long-term interest rate is in fact the crucial aspect on which market participants place their attention. As Blinder (1998, 30) expounds:

> The interest-sensitive components of aggregate demand react mainly to the real long rate while the central bank controls only the nominal short rate. In other words, the interest rate that the central bank can control doesn't matter (much), and the rates that really matter cannot be controlled.

Of course, this wisdom has been acknowledged for a long time, as the reference to Keynes in the previous chapter shows. Nevertheless, during the so-called monetarist experiment, many tried to ignore it. According to the FOMC transcripts from the Volcker era, the public did not trust the declared policy of substituting nominal interest setting by monetary growth rate targeting. Discussion of the effects of communicative interactions has caused the scientific community to become wary of traditional concepts of interaction in relation to economic institutions. In guiding the expectations of economic agents, a central bank is part of its own backdrop because central bank communications and the policy

of information disclosure concerning its own risk assessment – by, for example, the Federal Reserve – are interpreted as self-commitments of the central bank. More precisely, the central bank aims at sharing expectations with the agents of the markets focusing on its mandate.

The reason for this is that a central bank's power is asymmetric. It is strong verses the market in the case of a strategy of 'tightening money', whereas it is weak in the case of 'easing money'. A central bank cannot implement a policy of easing money in times where the agents of the markets do not possess an optimistic view on the economy. If a negative 'state of confidence' (Keynes) runs through the market, the central bank is weak in its capability to influence market expectations.[7] The real demand for guiding market expectations by central banks suggests a strategy which cannot be rooted in a uniform model or rigid rule. Such a rigidly fixed rule is, for the sake of simplification, identical with the assumed cognitive capacity of market agents (Greenspan 2003; Issing 1996; Muchlinski 2003a, 2003c).

Bernanke (2004a), among others in the literature on central bank communication and transparency, gives great attention to the question of whether a fixed rule implies higher effectiveness of monetary policy:

> The problem is that a number of contingencies to which policy might respond is effectively infinite (and, indeed, many are unforeseeable). While specifying a complete policy rule is infeasible, however, there is much that a central bank can do – both by its actions and its words – to improve the ability of financial markets to predict monetary policy actions. With respect to actions, the central bank should behave in as systematic and as understandable a way as possible, given the macroeconomic and financial environment. That is, although monetary policy cannot be made by a mechanical rule, policy can and should have 'rule like' features. Obviously, the more systematic and the more consistent with a few basic principles the conduct of monetary policy becomes, the easier it will be for the public to understand and predict the Fed's behavior. However, because the world is complex and ever changing, policy actions alone, without explanation, will never be enough to provide the public with the information it needs to predict policy actions. Words are also necessary.

The theoretical debates based on rigid premises which are not linked to the contemporary world have never reached the realm of central bank

practice, which focuses on the effectiveness of monetary policy in practice. Central banking as a practice needs to be based on the language and communication of the practice. A central bank must be able to act flexibly, but this does not imply acting without committing itself. Self-commitment is linked to transparency, independence, and accountability. Transparency implies understanding of what a central bank is, in fact, doing (Issing 1999; Blinder 1998). Blinder stated that 'communication is not precommitment' (2008, 918). Therefore, 'matching deeds to words' does not imply that communications constrain future decisions or actions of the central bank.

The Federal Reserve Bank's road out of 'monetary mystique' is described by Blinder and Goodhart et al. (2001, 67):

> Prior to 1994, the Federal Reserve did not announce its target for the Federal Reserve funds rate – the principal decision made at each FOMC meeting – even after the decision was made. Instead, it would normally enter the money market unannounced, leaving it to professional Federal Reserve watchers to figure out whether it was deliberately changing the funds rate or simply carrying out a technical ('defensive') open-market operation. Only the largely symbolic changes in the discount rate were publicly announced, and they were consequently treated as momentous events – 'ringing the gong', they were called.

Announcing the target for the Federal Reserve funds rate in 1994 was one important step taken among others (Kohn and Sack 2003). On the matter of the importance of its disclosure policy and communicative interaction, the Federal Reserve has been pursuing a new strategy of communicative interaction since 2000, after it founded the 'working group on the directive and disclosure policy'. These changes can be categorized as 'risk management rather than optimizing' in order to solve economic problems, instead of an establishment of rules. In order to improve its transparency the FOMC explicitly distanced its strategy from a rigidly fixed rules approach in favour of discretion and fine tuning. Since inflation expectation is not a 'jump variable' but rather a 'slow-moving-variable', the FOMC tried to achieve a neutral interest rate 'to promote effectively the goals of maximum employment, stable prices, and moderate long-term interest rates' (Blinder and Reis 2005, 21). During the Greenspan era, the FOMC made a transition to a comprehensive new approach on monetary policy, described as 'Greenspan-gradualism'. This entails 'interest rate smoothing', the 'reversal aversion'

combined with the strategy of publishing the 'risk bias'. It has also transformed forward-looking information policy.

This radical shift in the policy announcement of the Federal Reserve funds rate can be set against the historical background of both the Volcker era and the observation of the new type of inflation the United States was confronted with starting in the early 1990s. The transcript of the Federal Reserve Open Market Meeting on May 18, 1993, for instance, provides evidence of discussions as to whether the Federal Reserve was dealing with stagflation or whether rising prices were driven by inflationary psychological processes caused through changes in prevailing psychology. Greenspan commented:

> That's because in all of our analyses of inflation we endeavor to find the transmission mechanism by which the actions of workers in the wage bargaining process and of managers in price mark ups take place. The conventional wisdom in our models is that (the transmission) is largely induced through changes in psychology (1993, 9–10).

The argument of the assumed embodied inflation expectations entered the game because price movements normally have their basis in real world changes. The new phenomenon confronted the FOMC with the question of whether the underlying inflationary expectations can have real effects. Greenspan emphasized that if at first we recognize a change of fundamentals and, hence – as the so-called causality – we then observe a change in psychology, it is not convincing to argue that it means a change in people's attitudes has occurred (1993b, 39).

The path to greater transparency was motivated by the need to understand these new observations in different ways than had been the case in the past. In order to understand the changing economy in the early 1990s, the Federal Reserve was compelled to reflect upon and to rethink its traditional methods and instruments carefully. The Federal Reserve moved beyond the 'rules-versus-discretion' viewpoint because it lacked an understanding of the new phenomena. The Federal Reserve has not become attached to the dichotomy of the rule-versus-discretionary-model, but to different types of discrete models. It also evaluated and exploited past patterns and observations in order to discover historical regularities – and still does so. One crucial new perception and experience of this time was that new technologies led to unexpected changes and new phenomena in the price movements than had previously been the case. There was no possibility of relying on a single model or rule

in order to analyze the changing environment. The success of a central bank depends on a certain pattern of acting and ways of doing in response to changing contexts. Inasmuch as the Federal Reserve has started to think about its different kinds of communicative interactions with the markets, it has been developing a distinct view on *why, when,* and *what* a central bank could be communicating to markets. Moreover, the Federal Reserve made a radical change to its way of guiding market expectations by its 'bias policy' (Blinder and Goodhart et al. 2001). Three main aspects should be mentioned here:

1) The FOMC published its 'balance of risks' in order to describe its own view on the current macroeconomic performance and also the near future according to the Federal Reserve data and information.
2) It began reporting to the public after every meeting, regardless of whether a change of the interest rate was made or not.
3) The statement of the FOMC became more comprehensive in composition.

These major steps towards greater transparency were supplemented by a further significant change in 2002, when the Federal Reserve started to make announcements immediately after each meeting, including naming names. A crucial fifth step was implemented in 2005 by the release of the minutes after a three-week delay and before, not after, the next meeting was to occur. Before 2005, the minutes of the FOMC meeting were available following a six or seven-week delay, in other words after the next meeting. The minutes provide basic insights of the Federal Reserve's view of the current state of the economy, its prospective view, and also insights into the votes.

To sum up, there are many factors in the communication efforts of the Federal Reserve that have improved the possibility of anchoring expectations. Because of the radical changes in the Federal Reserve Bank's policy of transparency, and because of greater openness and disclosure (Bernanke and Kuttner 2003), market participants are now able to predict what the FOMC will do at its next meeting. Empirical studies have shown that particularly the short-run predictability of monetary policy has been improved (Lange, Sack, and Whitesell 2003; Poole, Rasche, and Thornton 2002; Thornton 2004). Since the Federal Reserve Bank is aiming at the long-run perspective of price stability, the crucial question is whether the communication of the Fed also contributes to predictions of what the FOMC will do in the long run. The disclosure policy of the Federal Reserve is a response to the uncertain landscape

which surrounds central bank policy. It is also a response to the perceived need to improve its communicative interactions. The Federal Reserve was trying to balance a need for a greater degree of transparency with effective monetary policy. The disclosure policy is pictured by Greenspan (2002, 5):

> Accordingly, as you know, we moved to the immediate disclosure of our policy actions and, over time, to explaining our decision and our sense of future risks directly after each meeting. In addition, we now publish full transcripts of our meetings after five years. Through these disclosures, together with congressional testimony, speeches by Board Governors and Reserve Bank Presidents, and the publication of the System's sizable research output, we endeavor to keep the public well informed.

It is not merely disclosure policy that has altered during these changing times. Since its power to influence in the long run concerns only the nominal magnitudes, the Federal Reserve Bank also changed its reasoning with regard to the process of building expectations. The communicative interaction therefore includes the central bank's questioning as to *how* the agents in the market *perceive* the price movements and *where* this perception comes from: is it rooted in data compatible with the Federal Reserve's data? Or is the perception rooted in a different interpretation of the material disclosed to the public? The Federal Reserve Bank not only discloses information to the public, but in trying to perceive how the public might receive and understand this information, it positions itself reflexively in juxtaposition to this information. This reflexive approach to its own disclosure policy is an important part of the modern view of central banking. As an institution the central bank is part of the structures and institutional facts it has itself created by its communicative interactions with the markets.

At this point the guiding of market expectations implies not only information disclosure by the central bank (such as the track report of the FOMC, bulletins, monthly reports, speeches, statements, minutes, and so forth), but also an attempt to understand how the markets perceive the information, that is, how the meaning and understanding of this disclosed information arise. It is assumed that the market participants, especially the analysts, try to reach a comprehensive overview of the central bank's policy by collecting the information (Demertzis and Hallet 2002; Demiralp and Jarda 2004). If central banking is described as guiding market expectations, then it is based

on communications, and, hence, on language activities. The modern view of central banks should also expound upon and emphasize the role language and communication play in economic interactions as interactive practice. Central banking as the guide of expectations cannot be separated from central banking as an interactive procedure or communicative interaction. Last but not least, the modern paradigm of central banking has already rejected the surprise-inflation bias, as introduced by Kydland and Prescott (1977) and Barro and Gordon (1983):

> In case of the modern incarnation of the rules versus discretion debate, based on time inconsistency, I have argued that things are starkly different. In my view, the academic literature has focused on either the wrong problem or a non-problem and has proposed a variety of solutions (excluding Rogoff's conservative central bankers) that make little sense in the real world. (Blinder 1998, 50)

Regarding the Barro-Gordon world, Cukierman (2002, 16) added that '*that* credibility problem of monetary policy is a thing of the past'. He argued:

> [T]he quadratic objective function originally postulated by KPBG carries the rather unintuitive implication that, given inflation, an upward deviation of employment from its desired level is as costly as a downward deviation of the same size. It is hard to see, why policymakers, or social planners for that matter, would object, given inflation, to a positive output gap. As a matter of fact it's quite likely that, in the range of positive output gaps, the quadratic was postulated mainly for analytical convenience rather than for its descriptive realism.

Cukierman demanded that central banks should be transparent with their economic model in order to explain the monetary transmission process. Modern central banks are often opaque regarding the implications of their models, premises, and conclusions. This opacity contradicts the current consensus of being open about the objectives and the desirable organization of central banking institutions. Whereas price stability seems to be an accepted goal across different views and theoretical approaches of central banking, the way of explaining the model implication and structures used for operational objectives of the monetary policy are not.

From the viewpoint of the Bank of England, Vickers (1998) outlined the approach as follows:

> It should go without saying that the MPC's objectives are given by the Act and by the remit set by the Chancellor. There is a large literature on inflation bias, but it is simply not applicable to the MPC. We have no desire to spring inflation surprises to try to bump output above its natural rate (wherever that may be). Quite apart from the obligation to fulfill our statutory duty, we have the strongest professional and reputation incentives, which in my opinion are incapable of being enhanced by financial incentives, to get as close as we can to the inflation target.

There seems to be no dispute about the inaccuracy of rigidly fixed rules or of simply relying on deductive arguing of the model view among central bankers. The connection between monetary policy strategy, its need to guide market expectations and the market responses came to the attention of central banks later – after the rational expectations hypothesis had lost its conviction. The reliance on the rational expectations hypothesis was a replacement of the illusion that the economy could be seen as a stable point of gravitation. Neither the Barro-Gordon model nor the concept of time inconsistency (Kydland/Prescott) could explain the phenomenon of stagflation because no central bank had supposed the public would act on the basis of the rational expectations hypothesis. A second twist in this hypothesis and the so-called 'Lucas-Critique' started with an emphasis on central banking practice (Muchlinski 1999a). As we have just seen, the reliance on a fixed rule of a monetary policy regime did not provide a way out of the problems central banks were confronted with. In an early paper, Blinder (1987, 135) went on to qualify his objections:

> The important thing is to make sure our models are congruent with the facts. Lucasians, it seems to me, reverse the sequence. They want to begin with fully articulated, tractable models and worry later about realism and descriptive accuracy. ... [T]he issue is how religiously we must adhere to frictionless neo-classical optimising principles until that glorious day arrives.

Secondly, the argument that a transparent central bank becomes 'hostage to market sentiments' (Jensen 2001) – because a fully anticipated monetary policy by the market participants is ineffective – has been rejected by the modern paradigm.

Thirdly, the asymmetric information argument regarding a central bank and the public has been revised, since communication has been accepted as important to transparency. However, the asymmetric information argument is not a striking one, because understanding and meaning are not based on information delivery (Muchlinski 2005). Bernanke (2004a), among others, appreciates communication as a mode to 'make information symmetric', a method to improve the private sector's ability to create adequate expectations. Since the Federal Reserve Bank has been moving little by little towards a new 'forecast based policy', the private sector is compelled to base its own forecast on a greater variety of economic parameters. Respectively, the private sector has to perceive a wider branch of the statements of the FOMC, different publications like the Blue Book and Green Book, the speeches of the chairman and vice chairman, and the press releases, in order to grasp the message of the Federal Reserve Board and to integrate that message into the private decision-making process.[8]

A particular consequence of the 'forecast based policy' is admittedly that the private sector has been bearing greater risks than before. The 'forecast based policy' also implies the possibility of minimizing financial risks as long as the public engages in communicative interactions with the Federal Reserve. Compared to 'forecast based policy', the traditional 'simple feed back policy' was endowed by only a few observable economic parameters – such as unemployment rate, inflation, wage structure, business orders, exchange rate, and so forth – and economic adjustments were judged to be easier regarding the informational constraints. According to the 'simple feed back policy', the development of the private sector's expectations seemed to be simple. However, simplicity is not always the best way to reach a goal, because it entails also the risks of travelling down wrong paths or being misguided. The current 'forecast based policy' acknowledges the uncertain landscape of a central bank's decision-making process:

> The view that less information could help to deal with the information asymmetry – the public does not know as much about the central bank preferences and intentions as the central bank itself – is surely paradoxical. (Blinder and Goodhart et al. 2001, 15)

An important reason for 'secrecy' is the admitted fact of the *asymmetry of time* horizons regarding different agents, motives, expectations in different markets and the central bank. The goal of price stability is a long-lasting objective which a central bank can try to achieve only by

operating in short-term horizons, which may conflict with the interests of market participants. Asymmetry of time horizons is a key feature of modern central banking. It is rooted in the divergence of monetary policy decisions, for example, setting the short-term nominal interest rate while influencing a long-term interest rate, which is compatible with the central bank's mandate of price stability evolving through the long-term transmission process.

The crucial element here is the difference between the market and the public regarding the time horizons. The phenomenon of time asymmetry implies that every decision and action of the central bank has to be discussed within this time asymmetry. The reason is that markets act within a short-term horizon, more or less a few months hence, whereas the Fed's attention is drawn to price stability after several quarters. Real rates (e.g. real wages, real interest rates) are results of market processes over time. Blinder expounded (1998, 60):

> It takes an amazingly strong constitution to wait that long. In stark contrast, the market provides a kind of giant biofeedback machine that monitors and publicly evaluates the central bank's performance in real time. So central bankers naturally turn to the market for instant evaluation.

Given time-horizon asymmetry, any central bank is compelled to respond to it in order to achieve its goal and mandate. A central bank cannot achieve its goal by surprise actions but only through the success of an initiative to guide the expectations in the money market to a coherent result. In light of the asymmetry of time, central bank decision making requires, in practice, the judgment of observations and the evaluation of different empirical sources in context, seeking to discern historical regularities as well divergent observations, rather than following a universal model by virtue of deductive reasoning.

1.3 Monetary policy as a language analogy

> A monetary strategy is like a language. Like a language it provides tools and a frame for reasoning, and a vehicle for communication. Winkler (2000, 23)

Economists are trained in microeconomics, macroeconomics, and metrics (Athey, Katz et al. 2007). They do not, presumably, study economics in order to consider questions such as 'why and how does the use of

language create social facts or institutions?' or 'does language require language?' I will return to such questions in Chapters 5 and 6. The constitutional role of language has already been accepted in the social sciences. Language does not work through artificial rules or signs, but through everyday language as used in practice and context. I want to deal briefly here with the issues of whether language is a self-identifying category of institutional facts – that is, whether or not there is circularity in arguing. I want to add certain aspects still missing in the current debate on central bank communications. If monetary policy works *through markets* (Blinder), that is, in guiding expectation-building, then interactive relations need to be set out precisely. This chapter provides additional reasons why monetary policy should be conceptualized as a 'language analogy', a term used by Winkler (2000) which has been increasingly accepted in the academic community.

In my view, focusing on the use of language and the communicative interactions of a central bank implies the following:

a) The world which surrounds a central bank is neither a fixed nor invariable world.
b) Uncertainty is the defining characteristic of that world.
c) A central bank acts within a democratic and institutional environment, not in social isolation.
d) The central bank's actions are due neither to an ordering of logical possibilities nor a mastery of probabilistic calculus independent of the central bank's practice and environment.
e) There are no such things as simple methods, linear mechanisms, or fixed rules by which to achieve a central bank's mandate when it must operate within changing environments and contexts.
f) The central bank's language is embedded in institutional practices, for it is this which gives meaning to its utterances.
g) An utterance or proposition can be vague. It can have a meaning which differs according to differing uses of language in differing contexts. Therefore. for the central bank to be accused of being vague in its utterances, statements, or announcements is attributable to the use of everyday language.

Two key propositions are relevant here: First, language is not identical with communication regarding its functions. Second, language provides a system of mutual orientation for both speaker and listener, a system that enables them to configure a context for communicative interaction. Furthermore, language functions themselves are based on

practice and custom. The function of a language is rooted in its elementary reference. It goes beyond being viewed as merely a medium of transforming information (Trabant 2008). For example, to use a language without a reference to its previous use will not allow the meaning of a word, phrase, or sentence to evolve. These have no private meaning: their meaning emerges through their use in practice. Language activity implies the use and application of sentences and expressions. We do not learn, or grasp, the meanings of words or sentences in isolation.

Using language structures thought and reality, because the use of language matters as an interactive procedure. This use creates institutional facts. Moreover, a word does not just refer to a mental state of an individual, nor to his or her intention, 'for then it means: *that* is how we use it' (Wittgenstein 1978 § 247). The mental state does not accompany the meaning of a word or a sentence. As Wittgenstein (1978 § 329) expounded: 'When I think in language, there aren't "meanings" going through my mind in addition to the verbal expressions: the language is itself the vehicle of thought'.

The prevailing view in the literature on central banking refers to the presumed mechanical symbols or signs as the means to 'exchange the already given meaning', or to 'exchange information'. Most branches of economic sciences are inclined to focus on language as a medium of exchange in relation to a given meaning, or the settling of information in order to optimize economic results. They ignore, or perhaps despise, the fact that language is elementary for the acquisition of knowledge and scientific work because language is not neutral as to thoughts (Trabant and Ward 2001). Language is elementary for common actions because it is a precondition of human interaction, dialog, discourse, and discussion (Tomasello 2002). Modern language sciences and cognitive sciences emphasize the constitutive role language plays in creating institutional facts, norms, rules, meaning, and understanding, as well as shared social values (Trabant 2009). Communicative interactions and language activities are not patterns, like mechanical reflexes according to the stimulus-response mechanism model. Communicative interaction is not simply the result of a transmission of information. The traditional view on central banks contrasts sharply with modern research in language and cognitive science (Kober 2002).

Market interactions are driven by language activities rather than by the mechanism of a pendulum or according to natural laws (Maennel 2002). The analogy to natural science is a misleading one. If we take seriously the critique of the 'car analogy' below, it follows that we cannot rely on such inaccurate images. Meaning and understanding are *not*

given ontologically. They are not composed of different properties, like a machine or a car. Bernanke (2004) objected to models employed for the sake of simplicity rather than for the sake of understanding. The 'car analogy' makes no sense:

> The FOMC decision process may appear straightforward. A commonly used analogy takes the U.S. economy to be an automobile, the FOMC to be the driver, and monetary policy actions to be taps on the accelerator or brake. According to this analogy, when the economy is running too slowly…, the FOMC increases pressure on the accelerator by lowering its target for the Federal Reserve funds rate, stimulation aggregate spending and economic activity…. What could be simpler than that?

The modern view of central banks is built on the view that communication matters because the central bank influences expectations by forward-looking decision-making (Blinder et al. 2008). Changes in the overnight rate affects the actions of the agents, that is, spending decisions and, hence, the pricing and of course employment decisions. A central bank influences expectation-building and, hence, decision making. Therefore, the central bank needs to explain its own view on the current and future performance of the macroeconomic reality.

Communication does not occur for its own sake, because it is connected to transparency and the independence of the central bank in democratic societies. Woodford (2005, 4) pictured the central bank as a 'manager of expectations', endowed with the power to set 'the future path of overnight interest rates, and not merely their current level'. He was opposed to the mechanical analogy because 'central banking is not like steering an oil tanker or even guiding a spacecraft' (ibid). According to the new paradigm of central banking, it is time to acknowledge the constitutive role of language activities in central bank theory. The guiding of expectations in the market cannot be separated from the use of language and communication.

As stated in previous paragraphs, the meaning of thoughts does not refer to a mental state or intention. If we acknowledge the modern view of central banking, the question 'does the central bank really intend, or believe, what is said?' is hardly relevant. Blinder gives an example regarding demands to publish the macroeconomic forecast by the Federal Reserve: 'One objection that central bankers occasionally raise is that the staff's forecast may not correspond to the beliefs of the actual decision makers' (Blinder 2004, 19). To be sure, if we accept

the modern view of central banks, it follows from this that such an objection would be meaningless because we do not assume a divergence between the statements of the central bank and its intention or beliefs. Whereas the considerations and contributions of classical economists often emphasized the language aspect, and also investigated the role of language in use, current economic work is predominantly couched in formal language. However, certain critiques on the predominant formal language approach to economic questions have already reached the agendas of economic meetings (Akerlof 2007). The new institutional economics emphasize the interdependencies of communicative interactions (Erreygers and Jacobs 2005; Maennel 2002). By language, I do not mean coded language.

The link between monetary policy and communication is important for transparency, that is, for both the effectiveness and accountability of a central bank. Communicative interactions should not to be confused with rhetoric (McCloskey 1983; Backhouse 1993; Henderson 1993). A central bank communicates in order to implement its mandate. Not only the disclosure of information and explanations but, furthermore, 'words are also necessary' (Bernanke 2004a, 6). A central bank's communications encompass information policy, but are not tantamount to that policy. 'Inevitably communication involves a large amount of detailed information on the central bank procedures, data, decision-making process' (Blinder and Goodhart et al. 2001, 10).

Any communication starts with the use of language, written or spoken (Trabant 2009). This links a central bank's communication to practice and environment. Any decision-making process and communicative interaction must be anchored in a reference. This reference should be linked to the contemporary world, not to unrealistic premises nor to logical syntax. The inherent connection between the use of language and the anchor of reference sheds light on the role language plays in communicative interaction. To picture a central bank in a prisoner's situation, in which communication and statements do not take place makes no sense at all (Blinder 1987).

Let us now turn to the important issue of central bank transparency, and communication needing to be linked more closely to the modern view of central banks. Winkler (2000, 15) proposed a differentiated the view of transparency focusing on 'the twin roles of a monetary policy strategy: information efficiency and communication'. He asserted the need to evaluate the implications of transparency, which touch on the communicative relationship between the central bank and the public. The latter refers to media, politicians, and agents in the financial

markets. I would like to mention Winkler's approach to differentiate communication and language. It is evident of the constitutive role of language in economics and theory (Muchlinski 2008). This is also true for central banking and communication.

Contrary to the traditional model of central banks, Winkler emphasized that transparency is first of all a 'social phenomenon' because it is addressed to independent institutions, central banks, which are part of democratic society. He (2000, 14) defined the monetary policy strategy as

> a systematic framework for organizing and structuring information and analysis rather than a specific monetary policy reaction function prescribing direct 'mechanical links' of policy decisions to particular economic variables.

At this point the demand for a central bank to 'aim at information efficiency' came into the game. A central bank needs to

> provide a framework for communication (that is, a vehicle for information transmission) both externally – in explaining monetary policy to the public – and internally (at least in the case of decision-making by a committee, but also in interaction between staff and policy-makers. (ibid)

The fundamental assumptions of this new approach by Winkler to central bank communication are certain considerations: clarity (C), honesty (H), and common understanding (CU) (Winkler 2000, 17).[9] Given also the assumption of 'bounded rationality' (Simon), clarity goes beyond merely the maximizing of available information. Clarity implies the strategy by central banks to structure and simplify information. Regarding heterogeneous agents in the market, a central bank has to differentiate its information, which can no longer be viewed as a homogenous good. The danger of confusion from multiple public messages or greater asymmetry of information has forced the central bank to provide differentiated information.[10] The result is that the traditional assumption of 'common knowledge', which the economist is used to working with, will become meaningless because different agents or groups in the financial market will get different information that they will also perceive and interpret differently. The common knowledge assumption has been created for the sake of simplifying model building in economics. It is based on the consideration that information is available to all agents at all times and that all agents are motivated to use it.

It also stops the infinite chain of reasoning. As Geanokoplos (1992, 54) described it:

> An event is common knowledge among a group of agents if each one knows it, if each one knows that the others know it, if each one knows that each one knows that the others know it, and so on. ... Thus, common knowledge is the limit of a potentially infinite chain of reasoning about knowledge.

Winkler introduced an internal and an external dimension of communication. The process of communication should be differentiated into a vertical and a horizontal dimension. This distinction gives a first impression of the problems any central bank has to deal with: the perception and attention that market participants do, or do not, pay to statements or information released by the central bank. The evolution of meaning and understanding is based first of all upon the perception of the central bank's voice, words, and sentences (Muchlinski 2005).

How, then, is understanding possible? 'Without this sharing of reactions to common stimuli, thought and speech would have no particular content – that is no content at all' (Davidson 1991, 159–60). Understanding depends on how market participants in fact interact – verbally and non-verbally. Davidson (1982, 327) argued that

> [t]o understand the speech of another, I must be able to think of the same things she does; I must share her world. I don't have to agree with her in all matters, but in order to disagree we must entertain the same proposition, with the same subject matter, and the same standard of truth. Communication depends, then, on each communicant having, and correctly thinking that the other has, the concept of a shared world, an interactive world. ... The conclusion of these considerations is that rationality is a social trait. Only communication has it.

Honesty indicates that the meaning of a central bank statement cannot be an external one. Davidson can be read as supporting Winkler's view: 'If all we have to go on is the fact of honest utterance, we cannot infer the belief without knowing the meaning, and have no chance of inferring the meaning without the belief' (Winkler 2000, 31). Winkler defined honesty as 'the degree to which the representation of information employed in external communication corresponds to the actual structuring of information adopted internally. ... Conflicts may, however, arise between internal and external communication needs' (ibid, 20).

Avoiding the traditional premises of common knowledge, Winkler introduced the importance of 'common understanding' regarding a central bank's context and environment. Since monetary policy acts on the basis of rules, these rules can be interpreted as serving a 'coordinating function in organizing public discourse', hence as communicative interaction (ibid, 23). He emphasized: 'transparency rests on the degree of common understanding between the two and is thus a social phenomenon'. To express a central bank's statement in formal language or coded language would impede common understanding. Everyday language is vague and imprecise, which evinces context and environment. Vagueness is characteristic of everyday language. Nevertheless, a central bank's need to focus on special information and to investigate certain economic developments, that is, the monetary transmission process, which differs extremely between countries, or prices of goods, markets, currencies, the rate of economic growth, and so forth – and, furthermore, the central bank's need to create and communicate certain data according to an economic environment – clearly describe its role as a monetary institution. As monetary institutions, central banks do have comparable monetary strategies in order to achieve an effective monetary policy.

At this point, it should be emphasized that language is not a vehicle to transmit ready-made meaning or informational content from a sender to a receiver. The receiver is not an empty box (the reasons are outlined in Chapter 3). Winkler discusses this point through a graphic presentation. He differentiates between white and grey boxes in order to show the meaning of the perceived information by the public cannot be controlled by the sender, the central bank. The distinction between grey and white boxes should indicate that the antique 'conduit metaphor' is not compatible with modern central bank theory and practice (Bernanke and Kuttner 2003, Blinder 1997). Consequently, Winkler takes the view that

> the notion of transparency as common understanding not only refers to information and modes of interpretation shared between central bank and the public. Communication takes place not between two monolithic players but between multiple senders ... and multiple receivers. In such a setting, a central bank's announcements also perform additional internal and external coordination functions. (ibid, 24)

To sum up Winkler's approach: In accordance with the modern view of communication (Tsohatzidis 1994), Winkler indicates a view of

central banks as senders of information, differentiated from the public as the receiver. Central banks provide information or data that has to be perceived and interpreted. Winkler emphasizes the need to change, in the literature of central banking, certain assumptions: the model of communication and the premises of common knowledge. The avoidance of these assumptions opens up another theoretical perspective on the communicative interaction of a central bank with its heterogeneous audience. Moreover, it moves towards the distinct perceptions through language because central banks do not provide the meaning and understanding of the delivered information. In the following chapter, I go on to argue that communication and language activity do not, in fact, matter as methods of transforming information going from the central bank to the public.

2
A Conceptual Framework for Central Bank Communication

> A game, a language, a rule, is an institution.
>
> Wittgenstein 1983, 334

In this chapter I want to move towards a workable definition of communicative interaction between the central bank and financial markets. This chapter deals with a comprehensive view of communication. Communication is not a linear transformation of information, hence not a linear transformation of a given meaning from a sender to a receiver. The release of information by a central bank implies the creation of non-linear communication structures. I want to propose a non-linear conceptual framework for central banking and communicative interactions. Since communication is based on interaction between at least two persons or institutions, this interaction contains different modes of perceiving, and processing of, information and, also, understanding. The conceptual framework introduces communication as a procedure of information processing, interactions among people and institutions in different contexts. It excludes the view that communication is based on coded language or mechanical adaptations as described by the standard model of communication.[1]

The non-linear conceptual framework I want to propose is a composition of three dimensions. It implies a dynamic relationship between the dimension, 2.1, information, 2.2, interaction, and 2.3, context. These dimensions change according to agents, preferences, times, and situations. This conceptual framework focuses on the interdependence between people's – and institutions' – communicative behaviour in relation to acquired knowledge and shared knowledge, or persuasion.

A treatise on central bank communicative actions, meaning, and understanding involves the need to consider the creation of the meaning

and understanding of central banks' actions. In this chapter I examine modern language and cognitive science research, which are important for central banks because they emphasize perception, adaptation, and context of decision making and action.

The academic concern, or everyday observation, that people's actions convey information and affect behaviour had been neglected in economic modelling prior to the paradigm shift towards information economics (Akerlof 1970). The results of modern language and cognitive science should not be neglected in macroeconomics. Regarding the importance of central banking in both domestic and international economies, central banking is about more than setting the short-term interest rate and guiding market expectations. Central banking is an important part of the culture of, emergence of, and maintenance of democratic institutions in society (Amtenbrink 1999; Issing 2008; King 2004). Any language approach to central bank communication, discourse, and writing needs, therefore, to give attention to a central bank's role in democratic society rather than to list a few labels concerning a central bank's goals.

2.1 The information dimension

I turn here to the first dimension of the conceptual framework, which should be introduced as *information transformation*.

Theories of information transmission – also called the classical model of communication – were sketched by the famous 'conduit metaphor' introduced by Lasswell in the 1950s (Lasswell 1948; Reddy 1979). Lasswell pioneered research on public communication in humanities and social sciences which, until that time, had been a domain of technology. The formula given by Lasswell exemplified the view that the process of conveying information can be pictured as a just-played billiard ball. Given this metaphor, information is interpreted as a sent message, and, according to the sender's intention and meaning, reaches the receiver accurately. In this model of an input-output transformation, the receiver is the double of the sender. The receiver is an empty box. Moreover, information is seen here, *not a related object*. Consequently, there is and will be no communicative interaction needed. The sent information entails the speaker's intention and meaning to be grasped, that is, understood as such, by the receiver.[2]

Theories of the transmission of information stating that information processing could be modelled like a billiard ball appear persuasively simple. For the sake of simplification they seem to provide clarity on the

information-sending process. Moreover, the modelling of information transmission treats it like sending a letter in the daily business of a post office. In a broader sense of the meaning, the postal carrier takes the letter from the sender to the receiver. But this simplified model does not provide a picture of what the receiver gets. What the hearer perceives, reads, and understands is neither identical with the piece of paper the sender sent, nor what the postal carrier delivered. Transmitting a message should not be confused with transporting it. Sending information cannot be modelled as the fall of an apple from the apple tree.

I now turn to an additional aspect of the classical model. Lasswell's formula of the 'conduit metaphor' has influenced ongoing research on communication. His view on communication as transmission of information between sender and receiver is based on the premise of the linearity of information. Any information is sent as an absolute entity. This premise also provides the required structure for the development of methods for the measurement of communication. Lasswell's model of an input-output transformation was driven, first and foremost, by a breakdown of the whole process of communication into distinct phases. Further underlying assumptions are the premises of uniqueness and exactness of information, and that any information can be measured. The inherent persuasiveness of this classical approach to communication is that information is not only an absolute given but also an objective entity. The presumption is required to explain communication modelled on an input-output transformation. To structure the model, Lasswell put the following question: 'WHO says WHAT in WHICH channel to WHOM with WHAT effect?' (Lasswell 1948, 37). If we follow his idea of breakdown or deconstruction, it seems practical to differentiate communication into absolute entities, and to read this as the presupposition of measuring a linear transmission. Merten (1993) emphasized that modern theories of communication still adhered to the Lasswell formula for the sake of simplification. While the focus is on the linear relationship between sender and receiver, the information itself is an absolute magnitude that can be quantified.

The Lasswell model is built up as a metaphor of putting a billiard ball into play. What is metaphor? Lasswell answered: 'Metaphor is pervasive in everyday life, not just in language but in thought and action. Our ordinary conceptual system, in terms of which we both think and act, is fundamentally metaphorical in nature' (Lakoff and Johnson 1980, 3). Lasswell, then, moved to 'physical metaphor': 'Briefly, "physical" metaphors involve the projection of entity or substance status upon something that does not have that status inherently' (Lakoff and Johnson

1980a, 461). This metaphor is not helpful in explaining the evolution of the meaning of the information, nor its understanding. Lasswell model neglects the response of the receiver, the situation and the context of the utterance, as well as the relational characteristic of any information.

A second important feature is the assumption of the neutrality of language, which is described in its role as the 'veil of thoughts'. Given this view of the function of language, it seems clear that the effects of communication are to be interpreted as causal – effects that are measurable, absolute, and objective-given entities. It is claimed that there exist no differences among information, language, and communication. A key term of the traditional view is 'the conduit metaphor'. In the classical view, communication is a metaphor of a communication machine (Shannon and Weaver 1963, 1947).

> Most theories of communication are based on the CONDUIT metaphor, in particular, all theories that view a language as a code and communication as sending of a message in that code from a speaker to a hearer. The medium through which the message is sent corresponds to the conduit'. (Johnson and Lakoff 1982, 9)

Any approach to communication which is based on the 'conduit metaphor' makes a claim as to the effectiveness of communication without drawing attention to understanding, and sees an identity with the mere sending of a message.

The classical model of communication in which language is neutral, that is, functioning as a label to name thoughts or objects – and in which information is already given and waiting to be re-allocated – is based on certain assumptions that can be described by a system of metaphors. This system is rooted in metaphors like rules, methods, and instruments of natural sciences. Communication is explained by moving and removing messages, which are taken as objects, things, and facts from the real world. Words and sentences do have meaning *in*dependent of contexts, situations, and the knowledge of the people who use them. In the classical model, communication is a medium for transmitting signals or signs within such systems as channels or receptacles. The transformation procedure is modelled as a container in which words are chosen to be transmitted to the receiver. The impact and consequences of the use of language or language activities are modelled like tennis balls. According to engineering communication, the view of the 'conduit metaphor' implies the exchange of given information between participants in order to balance the information pragmatically.

Any kind of information transmission between people and machines, or mutual transmission between people and people, is to be interpreted as communication.

New refinements on this semantic approach to language are provided by Lakoff and Johnson (1980), Johnson-Laird (1987), and Steube (1995). In their later work, Lakoff and Johnson (1980) explained language as an element of conceptual cognitive capability. Meaning is linked with concepts which are themselves elements of complex cognitive spheres. These spheres organize the knowledge of the world. Meaning is a result of interpretation. In Johnson-Laird's view, meaning refers to the procedural semantic. Semantic procedures provide the context of mental models for the rule-based interpretation of utterances. The meaning of the word or sentences does not represent psychological states. Steube focused on the interaction of text and structure and on the framework of an action. She inquired as to which strategy of textual work the speaker and the hearer apply to communicative interaction. The success of communication will also depend on the continuity of the analysis of the situation by both speaker and hearer.

Current research on language sciences and communication theories show that these works have already avoided the 'conduit metaphor' by introducing the notion of information as a property related to objects and people, respectively. The idea of successful communication without people interacting with one another or the assumption of the possibility of neglecting interactive processes has been abandoned. As Chaffee and Berger (1987) have explained:

> Communication science seeks to understand the production, processing, and efforts of symbol and signal systems by developing testable theories, containing lawful generalization, that explain phenomena associated with production, processing, and effects.

Another important feature of modern research, such as cognitive science and communication science, is that they are conceptualized as interdisciplinary approaches. In addition, the variety of distinct theories on communication is embedded in the heterogeneous fields of communication research. The International Communication Association provides different criteria in an attempt to systematize current communication research. Consequently it categorizes various sectors of communication, for example, political communication, mass communication, health communication, public relations communications, and so forth. Alternatively, communication can be categorized according to

various interest groups or subject categories; for example, communications law and policy, visual communication, gender communication, and so forth. Furthermore, it differentiates between sections and interest groups, and between separate levels of communication.

As Berger, Roloff, et al. (2010) outlined, it makes sense to distinguish, on the one hand, between a pure *intra* level of two individuals, and on the other hand the *inter*-individual level concerning communicatory relationships among people, or among people and the organizational level focusing on people's interactive communication in an organization, or finally drawing a societal level combined of, and proceeded by, the communicative interactions and properties of people in and within institutions of society. The latter can be described as a systemic approach which underlies the communicative interactions among people and institutions as an interrelated interdependency.

The supposition I would like to make for the purpose of the present analysis is: any kind of published paper (FOMC statements, protocols, minutes, monthly bulletin) implies an offer to communicate. Inasmuch as both written and spoken sentences are to be seen as a kind of offer of communication, both are to be described as a language activity. A written and published paper from the Federal Reserve, for instance a FOMC statement, presents itself as a product of text composed of language. The difference between a written and spoken communication is that the latter is a flux of words or sentences, whereas the former is created or fixed in a certain occurrence (event). The date of its creation refers to a certain point in the past which nevertheless will have effects on the present and into the future. The effects of any written text will usually remain perceivable beyond the concrete situation in which it was composed and completed. Any written text carries its own unique identity, in the form of an expression or utterance. Understanding does not succeed by adapting to the author's intention: rather, it reflects an agreement on a practice. According to the systematic approach to communicative interaction, communication is not to be seen as an act of transmitting the speaker's or text producer's intention to the listener or reader.

Let us briefly set out the key elements of a communicative situation between the central bank and the financial market. We suppose that any communicative situation consists of a reader or recipient, a writer (text producer) or author of a text, and the knowledge or information embodied in the utterance or document. The reader of a written text will be at best supported by the gestures, mimes, symbols, intonation, and prosodic emphasis by the text producer. The coincidence of time in

the current situation – presenting the text by its author, and the audience that is listening – will supposedly lead to a better understanding. The reader of a text is able to check his understanding right away, while the author of the text moves on with his presentation. The written text supplemented by gesture, mimes, symbol, intonation, and prosodic emphasis and the immediate reaction to it by the reader will enhance understanding. Depending upon the reader's acquired knowledge – that is, his epistemic background and his experience – the recipient of a text will be able to identify the producer of a text either explicitly, or by referring to certain characteristics found in the text. This provides the possibility of assessing the written text, inferring meanings, and improving understanding on the part of the reader.

A presupposition for understanding a written text is the context of the production of this text. First of all, there is the context of the use of language, that is, the linguistic practice – a language-game as I will introduce in Chapter 5 – which is relevant for both the spoken and written communicative situation. In a spoken communicative interaction, a person is able to add the perceived elements of knowledge, the mode of the presentation, and the habitude of the author, as well as the particular history of the production of the text. All this will facilitate the discovery of any special social or terminological orientation in the text. For instance, in the case of a written paper by the FOMC of the Federal Reserve it is important to recognize who presented it and when (Thornton 2004); by the European Central Bank (ECB), as Ehrmann and Fratzscher (2005a; 2006; 2007a), Jansen and de Haan (2006), Rosa and Verga (2007) – among other authors – in their empirical investigations document. The time of presentation *and* the time of the production of the paper shed light on its meaning and importance. Understanding depends on a coherent view of the whole. The surroundings of a written or spoken text also entail the epistemic presupposition of an understanding.

Regarding theories of understanding, we need to differentiate between the concept of 'contextualism' as opposed to 'foundationalism'. Contextualism refers to cultural norms, to theories of discourse ethics and certain types of justification (Haack 1993). The distinction between both views – 'contextualism' and 'foundationalism' – concerns the means of justificative truth and correctness of a written text, for instance by referring to a particular class of beliefs which should be interpreted as determined by naturally given or intrinsic epistemic entities ('foundationalism') or by relying on beliefs built up from the context. The latter implies the context will serve as a producer of sense.

Regarding the constitution of the meaning, it is also important to focus on the surroundings of a text. This implies the mode of communication, that is, spoken language, whereas the specification of the topic of the text and its context is composed by the constitutive elements of the text production as such. To understand a text does not mean to register the words and what is written in black letters on the paper rather than to grasp and understand the potential, the non-identical, perception of the sentence. This sheds light on the importance of the recipient and his or her understanding, or, as Issing (1999) outlined, on the perception. Without a doubt, the understanding of a sentence has much more in common with perceiving what is going on in reality, or with context.

The historical line of traditional theories of understanding relies first on suggested correlations between objects and names, or of object, mind, and name as a kind of representation. Furthermore, it refers to the idea of a translation of objects into names and labels, or to the idea of transformation or metamorphosis of so-called input-output relations. Those concepts of understanding are devoted to the failures of classical models of communication and their presupposition: the neutrality of language. A second historical line of those theories of understanding focuses on the subject only, on the individual mind and mental state of a subject. To understand was now conceived of as a form of mind-constitution which excluded the outside world. Whereas the first historical line outlined the idea of representation or translation, the second historical line worked on the idea of a private constitution of the understanding as a procedure of a subject's mind. The evolution in these lines of analysis marked, therefore, a paradigm shift from supposed objectivism to supposed subjectivism. Both, however, have to be seen as a naïve form of simplification of understanding.

In contrast to a written paper or text, any spoken utterance from a text producer or author will only occur at a particular moment of time, due to the flux of spoken words and sentences. Communication is the use of language in practice. The use of language is inevitably connected with a way of acting. An act of communication does not create a simple causality between the communication and the subsequent results. The use of language set in motion a change of the knowledge. Communication is not to be confused with information because the communicative act leads to a change of the amount of knowledge. The attempt to explain communication by referring to a monocausality of information given by the sender to the receiver is not satisfying in the light of the underlying presumption of this model of communication. Any postulated

causality in social sciences is based on changes of content, but not on a change of a causal connection. The meaning of a written and produced paper or the meaning of an utterance (expression) is not driven by such causality.

The communicative way of proceeding is a composition of different modes of action. Nevertheless, as explained below (and referred to already above), meaning is not to be discovered by decomposition of the sentence into words but rather by the way of articulation or via expression (*Äußerungshandlung*). A central bank's role of guiding market expectations is inherently connected to communicative interactions. Considering its public mandate, a central bank is a key player. From that point of view, a communicative strategy of the central bank is not identical with a strategy of selling products. The central bank does not sell a 'product' because the creation of money in its functions as a medium of deferred payment, unit of account, and store of value depends on its acceptability by the public. Money functions as money because the role of the central bank has been accepted by society. There is no bilateral relationship which creates money in its functions. Money acquires its acceptability through a trilateral relationship in which debtors and creditors build up the first order of this relationship and a third party, the central bank or monetary authority, functions as the legitimate instance. Money cannot be defined by lawgiving or by a law, since a central bank must gain in credibility and reputation as a third party by fulfilling its mandate of price stability, hence through its reputation and credibility.

The following quotations briefly exemplify the crucial aspect that money is not defined by an object, truth, silver, or gold, but rather by confidence in its prospective functions as a medium of deferred payment, unit of account, and store of value, hence in its function as a public good. Here, the analogy with language makes sense considering that language in its function cannot be interpreted as a private language, 'language is necessarily a social affair' (Davidson 1992, 262). Language finds its role out of a trilateral relationship or a 'share world' (Davidson 1991, 156):

> I believe Wittgenstein put us on the track of the only possible answer to this question. The source of the concept of objective truth is interpersonal communication. Thought depends on communication. This follows at once if we suppose that language is essential to thought, and we agree with Wittgenstein that there cannot be a private language. The central argument against private language is that unless

> a language is shared there is no way to distinguish between using the language correctly and using it incorrectly: only communication with another can supply an objective check ... a standard of objectivity in other domains. (ibid, 157)
>
> The publicness of money resides essentially in its general acceptability, which make the value of money balances held by each individual depend not only on his own possession and market prices, but on the holding of other persons. (George Grantham et al. 1977, 345; in Spahn 2009, 6)
>
> Because money is a claim on the economy as a whole rather than on a single individual, there is not need to acquire information about the individual who offers it in exchange. ... It is information costs that lie at the bottom of any difference between money and other assets. ... The institution of money can act as a substitute for trust. (Douglas Gale 1982, 187f, 239; in Spahn, ibid, 4)

A central bank shapes market relations in order to establish a medium which will possess all necessary features of the credibility of money. There are no symmetric relations between a central bank and the agents in the markets. A central bank's goal is to participate in, and to contribute to, establishing the sense of market activities. The concept of the market is rooted in space and time. A central bank will coordinate its own expectations about the future path with the agents' expectations based on their future view and goals.

The current literature emphasizes the relevance of central bank communication. It has been examined by different methods involving the measurement of the words, different types of communication, and different types of information the central bank gives the public. Regardless of specific technical aspects and problems of these measurements, which authors debate in their research, the conclusions of current empirical studies seem to have achieved a consensus: communication helps fulfil a central bank's mandate. Another consensus is also conceivable: that is concerning the efforts to reflect and investigate communicative interactions between the central bank and agents in the financial markets more intensively.

In this section I would like to introduce arguments for differentiation among language, communication or communicative interactions, and information. According to the modern view of language, the commonly characterized feature of language, communication, and information is that these concepts do not refer to objects or things (Tugendhat 1976, 161f.). Things or objects, like cars, stones, and books have their

own bounds or districts, which can be easily identified, recomposed, weighed, and measured. But this is not true for language, communication, and information. Neither language nor communication nor information are to be identified as objects. Information and communication are often seen as a given fact rather than as something which requires implementation among people in order to be judged or assessed. Furthermore, language, or information, is not identical with communication. Language does not exist as a list in a catalogue. This is also true beyond the obvious fact of the existence of dictionaries.

As discussed at the beginning of this book, central bank communication should enhance the effectiveness of monetary policy. A central bank's communication regularly encompasses inflation reports, talks, minutes, statements, speeches, and monthly bulletins by a central bank. It implies written and verbal language. The communication of a central bank is also interpreted as the disclosure of given information by the central bank to the public. In empirical studies, the release of information is often discussed as 'dismantlement' (Buiter 1999; Ehrmann and Fratzscher 2003). What does the measurement of the communication of a central bank estimate? Does it measure the transmission of given information? According to literature, it is supposed to measure whether and how the sending or providing of information has initiated any, or a particular, effect in the activities of the market or in agents of the market. The measurement tries to establish and document an increase or decrease of market transactions or changes to interest rates.

From the viewpoint of the classical model of communication, the primary goal of communication is the effectiveness of the exchange of information between the sender and the receiver. The measurement of the effectiveness is desirable and feasible. The striking feature of the classical models of communication is the heritage of Aristotle's view on rhetoric, which has also been interpreted as a model of communication. Aristotle constructed two models of thinking. One model entails absolute but not relative or relational entities. The second model describes the procedure of communication as rooted in the intention of the speaker and the assumption of the causality of the effects of rhetoric or communication, respectively. The classical model of communication is based on both principles as sketched in these two models. The most famous successor of this model of causality, which is oriented towards absolute entities, hence to positions and not to relations, is the early theory of Lasswell.

In the literature we find a distinction between two approaches to communication, information and language, both of which are based on

the 'conduit metaphor' (Fiehler 1990, 104f). The first approach is found as metaphors in daily life. This also casts light upon the multiplicity of aspects ascribed to communication:

a) communication as a means of conveyance of goods;
b) communication as a battle of argument, as a defense, as an attempt to campaign against another person;
c) communication as an act of eating (feeding), excreting, and digesting;
d) communication as a procedure for constructing a house or a speech, to underpin an assertion or break it down;
e) communication as a method of weaving, dwelling on thoughts, and getting tangled;
f) communication as an act of painting a picture or delineating the ambience; as an illustration of one's mental state or one's thoughts, which otherwise would remain hidden;
g) communication as a process of growth-like flowers in a garden, as a creeper climbing a wall;
h) communication as flux or movement.

This short list of examples might give an idea on the variety of the uses of communication in different situations in daily life. As we follow this approach to communication, we are able to grasp that communication seems to have many uses in different life situations. Nevertheless, this approach fails to describe communication properly because of the underlying assumption that communication is interpreted as corresponding to objects or entities and their attributes.

The second approach to communication, also based on the 'conduit metaphor', underlines the role of language alleged to be neutral because it gets its relevance as a 'veil of thoughts'. Furthermore, it shows that communication is a central instrument for conveying information between the sender and the receiver. Communication serves as a rational procedure for transmitting information from the sender to the receiver. It also allows the balancing of existing gaps of knowledge between both agents. Supposing a gap of knowledge is an important assumption in order to give relevance to communication. In this, communication is not linked with understanding but rather with the attempt to balance given information.

Both these approaches are based on the 'conduit metaphor'. It is for this reason that communication is interpreted as an exchange of given information, in order to reciprocate information which should balance

the different internal states of both the sender and the receiver. But with this enlarged concept of communication, exchange and reciprocity, the process of communication itself has not become any clearer. The aspect of reciprocity has not removed the classical view of communication because it remains an epiphenomenon. It is misleading to argue that a process of communication is nothing more than an exchange of given information or an exchange of a given meaning. Nor can communication be explained by referring to an assumed symmetrical or reciprocal distribution of information or meaning. Insofar as the investigation of communication is focused on the idea of the measurable effects of the communication rooted in the linear transmission from a sender to a receiver, but neglecting the context in which the communicative action takes place, the incompleteness of models of communication still remains. Communication does not refer to immobile objects. The understanding of communication does not succeed by an appeal to reciprocity but only by investigating the communicative interaction in given contexts.

As I will expound in the following chapter, communication encompasses relations and procedures which are systematically changeable through the communicative interactions. Additionally, it needs to be recognized in the attempt to quantify and to measure communication that communication has no dimension which can be precisely stated, like the dimension of electricity or magnetism. Fiehler (1990: 192f.) pointed to the mathematician Norbert Wiener, who explained in 1948 that communication is understandable only as a systemic relation and not as a linear procedure. Wiener himself referred to the logic and the paradoxes of communication. Bertrand Russell gave striking examples on paradoxes of communication. One famous example is the following: if a Cretan says, 'all Cretans are liars', an example Watzlawick et al. (1967) also discussed as a paradox of communication.

In technical engineering terms, any communication implies interchanges in order to convey data, information, symbols, and signals in the specific situation in which the communication takes place. The goal of this interpersonal communication is similar to the role communication has in the 'conduit metaphor' approach. According to the 'conduit metaphor', both the mundane and scientific concept of language, information, and communication is that of a physical entity for transmitting information, signs, or symbols between different systems. In this engineering view of communication, the term information is used as a synonym for knowledge. Granted the premises that any linear transmission of information will enhance the body of knowledge, balanced by

the sender and receiver symmetrically, nothing could be more desirable than the continuity of the linear communication. Reality, information, and meaning are already given and need only to be equalized between the sender and receiver, like water in a river. The modern approach to linguistic sciences emphasized the *in*significance of the 'conduit metaphor' (see Trabant 2003).

In their later work, Johnson and Lakoff (1982, 9) emphasized the uses of the 'conduit metaphor' in situations in daily life:

> These are situations in which the following conditions hold: (1) These participants are equally competent speakers of the same dialect of the same language, and individual variation is insignificant. (2) Relevant to the subject matter and the context, the participants share a) the same cultural assumption, b) the same relevant knowledge of the world, c) the same relevant background assumptions about the context of the utterance, d) the same understanding of what the conversation is about, and e) the same relevant conceptual metaphors and folk theories.[3]

What should be right for communication seems also to be appropriate to language, too. The classical view did not differentiate among words, sentences, language, communication, and information. Moreover, it draws no attention to processes of understanding. Language is identified as a system of rules or convention, as an instrument of thoughts, as a medium of transmission of experience, information, and knowledge, as an organism, or as the amount of infinite words.

Of course, different conceptual approaches to language, information, and communication provide different understandings. Language, information, and communication are not defined by the exactness or non-vagueness of the concept, nor by its numerical elements or quantities. In contrast to such a view of exact and non-vague terms, language, information, and communication get their meaning out of situation and context as related issues. The view of the vagueness of language and of meaning necessarily avoids the adherence to objective criteria of truth (Graff and Williamson 2002; Raffman 1996). To put it more precisely: language, information, and communication are not absolute objects or entities which are independent of their use.

In contrast to such a classical model of communication, any communicative act is inevitably connected with the exertion of efforts to understand. The misunderstanding arises out of the conception of language, communication, and information as absolute object which could

be quantified, measured, and objectified as things. Articulation, that is, expression and utterances, are not understood because they are measured and quantified. Wittgenstein (1983) emphasized:

> Nothing is commoner than for the meaning of an expression to oscillate, for a phenomenon to be regarded sometimes as a symptom, sometimes as a criterion, of a state of affairs. And mostly in such a case the shift of meaning is not noted. In science it is usual to make phenomena that allow of exact measurement into defining criterion for an expression; and then one is inclined to think that now the proper meaning has be *found*. Innumerable confusions have arisen in this way. There are, for example, degrees of pleasure, but it is stupid to speak of a measurement of pleasure. It is true that in certain cases a measurable phenomenon occupies the place previously occupied by a non-measurable one. Then the word designating this place changes its meaning and its old meaning has become more or less obsolete. We are soothed by the fact that the one concept is more exact, the other the more inexact one, and do not notice that here in each particular case a different relation between the 'exact' and 'inexact' concept is in question: it is the old mistake of not testing particular cases. (Wittgenstein 1967 § 438)

Inasmuch as the effectiveness of the communication of central banks should enhance the effectiveness of monetary policy, it is obvious that investigations and contributions on their communication and language are mainly concentrated on those instruments and methods of measurement which are predominantly applied to economic questions (Kohn and Sack 2003; Ehrmann and Fratzscher 2005a). Nevertheless, it makes sense to enlarge the view on economic interactions which goes beyond such methods. If language, sentences, and words are extracted from their use in practice, they will lose their meaning and will be nothing more than empty concepts. Wittgenstein (1978 *PI* § 96) explained:

> Thought, language, now appears to us as the unique correlate, picture, of the world. These concepts: proposition, language, thought, world, stand in line one behind the other, each equivalent to each. (But what are these words to be used for now? The language-game in which they are to be applied is missing.)

The meaning of a word or sentence arises out of the use of colloquial language, but not by supposed correspondences of the objects

to the world. The use of language is not a result of constructing a superstructure, but a consequence of the development and changes of concepts due to changes in the society and sciences. Language-based knowledge is not composed of atomic entities. Words and sentences are not empty boxes or empty containers which can be filled in with meaning.

The implication of the conditions outlined and premises encapsulated in the classical view is that the function of language is to conduct and transfer thoughts or mental states from one person to another. Writing and speaking should be seen as analogous to inserting a coin into a machine: according to the classical view, when people write or speak they insert their mental state or thoughts into words. Words, therefore, are nothing more than the veil of thoughts. Consequently, words merely accompany thoughts by containing and transferring it from the sender to the receiver. A further strand of this scientific approach to communication stated that communication is a method for constructing and negotiating facts of reality and social life. According to this view, communication is a method of creating reality.

2.2 Constitutive process of information processing

I now turn to *information as information processing*. As a key assumption, *information* is regarded as *a related object*. More precisely: information refers to people or other objects and, more importantly, different structures of communicative actions. The acknowledgement of *information as information processing* implies that information is not given ontologically but rather that we must consider *information as a related object*. This does not mean focusing on a person's intention or mental state but rather paying attention to a person's interactive activity and procedure. Information is not a natural phenomenon like trees or stones.

The concept of *information as information processing* draws attention to certain assumptions about a person's cognitive ability to learn, adapt, understand and, hence, configure their environment (Planalp and Hewes 1982). It refers to persuasions as a particular inherent moment of any communicative interactions and to the environmental structures of the discourse (Sucharowski 1996). Any information is perceived, recognized, and understood by people (Pretty and Cacioppo 1986). Actions convey persuasions. There is, of course, a convincing example of a successful interdisciplinary approach in economics and science. Take, for instance, the new paradigm of information economics, which acknowledges fundamental research in cognitive science to refine

economic modelling of information (Kahneman 2003a, 2003b). In an earlier paper Akerlof (2002) stated:

> Cognitive psychology pictures decision makers as 'intuitive scientists' who summarize information and make choices based on simplified mental frames. Reliance on rules of thumb that omit factors whose consideration have only a small effect on profit or utility is an implication of such cognitive parsimony.

Working out a non-linear conceptual framework of central bank communication requires the introduction of communication as a multidimensional approach. The key assumption inherent in this view states that information processing is a result of people's process for selection, perception, and adaptation. Furthermore, it is based on the process of docking information to an acquired knowledge base. This knowledge base is changeable by the learning process of the individual.

According to modern cognitive science, any information processing is called a cognitive procedure driven by the central nervous system (Cacioppo 2002). Of course, neither economic theories nor theories on central banking or monetary policy are concerned with the functions of the central nervous system – not even the central nervous system of the central banker. This is admittedly beyond the realm of economic research. However, economic theories are applied so as to work with assumptions of information processing, which are often modelled as a linear transformation of information processing or linear modes of causalities. It is hardly convincing, however, to model information processing by an analogy with the mechanism of causality by neglecting the important factor of related people – or groups of economic agents – institutions and norms to which it is related. The car analogy should be substituted by the language analogy.

A person acts for a purpose and on volition. This is also true for institutions as interpreted by modern organizational or institutional theory. Institutions are seen as learning, acting, and changing (Noteboom 1999). To argue that the reason for the activity is arrived at by the operation of a pendulum is an inaccurate premise for economics as a social science. People act from a complex set of hierarchically ordered wishes that appear to each economic agent or institution as rational at the time the actions are taken. Acting without reason is not rational at all. To presume actions to be a mechanism without reference to reasons is not an accurate premise for the communicative approach to the modern paradigm of central banking as discussed in this book.

Moreover, research in cognitive science indicates that modelling a person's perception and understanding as a black-box mechanism is misleading. I refer here to Goldstein and Gigerenzer, who introduced a heuristic approach to social sciences.[4] Heuristic methods are strategies that steer information searching and processing, and cannot be handled by logic and probability theory. In contrast to Kahneman and Tversky (2003) and Gigerenzer (2002), Gigerenzer and Goldstein presume a different concept of rationality is needed in order to work out the information processing and decision-making procedures under uncertainty. Goldstein and Gigerenzer's (2002) interdisciplinary research acknowledges the cognitive capability of people. They call the environment that surrounds economic decisions and behaviour an 'ecological environment' (ibid 2002, 85). The social environment is described as an ecological one because the individual act within certain surroundings is rational in order to achieve a goal.

Goldstein and Gigerenzer in particular introduced 'the recognition heuristic' to explain how an individual exploits the structures of information in the changing environment by using memory and perception. The authors asked the participants in their experiment the following question: 'Which city has a larger population: San Diego or San Antonio?' While 66 percent of Americans answered correctly, 100 percent of Germans answered correctly that San Diego is larger. The surprising result of their experiment was that during the four-week testing phase the accurate answer was given less frequently by participants although they had comparably more information, memory, or the opportunity to talk in the last phase than in the starting phase of the experiment. The recognition information acquired during four weeks of experimentation was used as a substitute for the genuine recognition information. From the experiment Goldstein and Gigerenzer (2002) concluded that more information, knowledge, or data is not always better in solving a problem.

The demand to maximize or optimize the store of knowledge, information, and data is not a true demand in social sciences (Künne 1993). Moreover, it is often not possible. Mathematical optimization often does not provide any empirical validity. Heuristic studies, for instance recognition heuristics, are concerned with questioning how agents make decisions and judgments in a concrete situation. They do not depend on optimization or maximization of the utility function or working out a mathematical proof. The recognition heuristic is ecological because it draws on a relationship to the environment and not to mathematical or logical rules. Gigerenzer (2004, 62) described an interesting example

which enlightens us about the rules of formal models in decision making based on using everyday language:

> A decision theorist from Columbia University was struggling whether to accept an offer from a rival university or to stay. His colleagues took him aside and said: 'Just maximize your expected utility – you always write about doing this'. Exasperated, the decision theorist responded, 'Come on, this is serious'.

Heuristic thinking is crucial for decisions and judgments that are not measurable and computable or if measured and computed would lead to serious problems of interpretation in terms of reality. One has to decide: Is the decision-making process computable or not, and how can the likely outcome of the mechanical procedure be linked to the contemporary world? To put it briefly: the recognition heuristic is not a general method applicable to any kind of question because of the conclusion of the Gigerenzer experiment, that is, 'that a recognized object will be chosen over an unrecognized object'. The Germans chose San Diego because they had more knowledge or information about it than about San Antonio. Application of the recognition heuristic, and of everyday language, is suitable if ignorance or lack of recognition is systematic. This is also true for interaction between the central bank and financial markets. Gigerenzer (2004, 64) gave the following example:

> If you learn to fly an airplane, you will be taught a version of it: When another plane is approaching, and you fear a collision, then look at a scratch in your windshield and observe whether the other plane moves relative to that scratch. If it does not, dive away quickly. For the pilot, the goal is to avoid a collision, whereas for the outfielder, the goal is to produce a collision. The nature of the heuristic is the same.

He resumed:

> Evolved capacities can make a heuristic simple, while the structure of the environment can make it smart. (ibid)

Goldstein and Gigerenzer (2002, 76) outlined the need to acknowledge that decision-making and judgment are based on an acquired knowledge base, so-called 'evolved or learned capacities of an organism'. The acquired knowledge base is embedded in social acting and

practice. Heuristic methods exploit the evolved capacity and the structures of the environment. Heuristic methods are often incompatible with measurements and computer programs, as fundamental research in psychology indicates, for instance, the gaze heuristic. Catching the ball in a game does not require calculating or computing a particular rule about how the fielder should move in order to catch the ball. The goal of optimization does not fit the need in practice. According to the recognition heuristic, the authors concluded that forecasts based on the heuristic model will not lead to optimization since the logic of heuristic methods is variable:

> The gaze heuristic, for instance, predicts that players catch the ball while running, which follows from the fact that the player must move to keep the angle of the gaze constant. Similarly, when the ball is thrown to the side of the player, one can predict that the player will run a slight arc. ... (see Shaffer et al. 2002 in Gigerenzer 2004, 64)

What can be concluded from this recognition and gaze heuristic for central banking? The evaluative procedure on which any decision-making process is based is inevitably rooted in an acquired knowledge base. It is also due to differentiated modes of judgment of the information in different contexts (Gigerenzer 1996). Regarding this research I would like to emphasize that information processing is neither a linear procedure (because of distinct responses and reactions by people in different environments) nor a process beyond communication interactions and the use of language. More importantly, it is the language and communication-*based* information processing that creates such complex results.

Information processing is a cognitive process involving a person's selective perception, different modes of adaptation and understanding based on bounded rationality (Kahneman and Tversky 2002; Gigerenzer and Selten 2001a, 2001b), and it is precisely this cognitive process that is not an invisible or inner, mental process, but rather one of discourse and communicative interactions, which, I should remind the reader, are driven by the use of language because language is not neutral to cognitive or heuristic procedures. Gigerenzer et al. show in their heuristic approach to social phenomena that recognition capacity guides the understanding and meaning of information perception. They also expound that information is perceived through recognition ability, experience, and selective perceptions, which also depend on

the context and cannot be delegated to rules or criteria beyond that game or practice. It is important to open up the debate beyond deductive modelling by integrating cognitive science results considered relevant to central banking as a conceptualized language analogy. This research in cognitive science is important for macroeconomics in order to understand how meaning and understanding evolve. As revealed by the history of information economics, the interdisciplinary approach to macroeconomics has provided theoretical developments. Nevertheless, a great deal of work has to be done if we are to understand new phenomena in financial markets and behavioural finance (Fudenberg 2006; Mullainathan and Shleifer 2005).

Expanded a little, the issue outlined a bit further, that is, information as processing information and, hence, as a related object, includes drawing attention to the limits that constrain a person's attention and information processing. A pioneering work has been introduced by Festinger (1957) who defined it as people's 'cognitive dissonance'. This 'cognitive dissonance' theory is based on the observation that a person's perception is both incomplete and selective regarding the acquired knowledge base, experiences, preferences, interests, plans, and cognitive capacity.

Moreover, people are inclined to avoid divergences of cognition for the sake of a pleasant state of mind. If, for instance, a passionate smoker reads information about the danger of smoking, this will create cognitive dissonance in the person. According to the 'cognitive dissonance' theorem, the smoker seeks a reduction of cognitive dissonance. How could cognitive dissonance be reduced? The person could stop perceiving and reading the dissonant information. Alternatively, the person could attempt to discover other information to reject the information that smoking is a danger. Or the person could develop a ranking on the probability of dying as a consequence of smoking in comparison with other causes of death, for instance accident, hurricane, lightning, and so forth.

The important question of which strategy is eventually chosen to reduce cognitive dissonance is embedded in various social aspects, motivations, emotions and interactions – and still open in social research. While cognitive dissonance theory has been influencing scientific procedures since its arrival in the 1950s, research on motivations, efforts to reduce cognitive dissonance and the different ways people choose to achieve a better or pleasant state of mind has been investigated by social psychology, cognitive science as well as economics to this day (Harmon-Jones and Mills 1999).

As already mentioned, one striking result of cognitive research is that the cognitive or learning procedure never starts from zero. In contrast

to a machine such as a car, it is not possible to downsize the knowledge and experience back to zero by turning the key. Any conveyed information will therefore dock to the acquired knowledge base and experience of a person, the so-called cognitive representation. The cognitive capacity and information processing of a person cannot be explained by referring to the person as an empty box that should be filled up with information. This would run counter to the research of cognitive, language and learning sciences. Moreover, it would contradict the assumption that information is an interrelated object as modelled by the research of cognitive and language sciences. Perceptions, meaning, and understanding are not mechanical outcomes of a linear transformation of information. This is accepted by modern sociology, organizational theory, and new institutional economics (Streit, Mummert and Kiwit 2000; Streit 2009). It should, therefore, not be neglected in the literature on central banking and monetary policy. I would like to emphasize that economics as a social science uses everyday language to develop theories and hypotheses. Economics is also the result of language-based and communicative interactions.

The heuristic methods outline the procedure of adaptation and reception based on the acquired knowledge base, emotions, and behaviour, which are configured and reconfigured by distinct experiences, cognitive procedures, and interactions with people and/or institutions. Modern cognitive and learning sciences describe information processing as both a receptive and a constitutive process (Snyder and Stukas 1999; Sullivan, Snyder and Sullivan 2008). A procedure in the receptive mode of information processing enables understanding by a person's ability to steer their attention and perceive information against the background of their acquired knowledge. This receptive mode is accompanied by a process of personal selective evaluation and reflection on the information.

The constitutive process of information processing describes the roles of cognitive representations of intention, facts, and feelings, which all have been mostly learned by the individual. According to recent research in scientific debates there is no existing controversy about that: Learning is dependent on emotions, feelings, and memory. There is a consensus to accept the individual as a learning person and not an empty container. Moreover, the understanding of information is linked first to the acquired knowledge of a person and impregnated with particular issues of judging. Secondly, the assessment or judgment of the information is connected to the first aspect and dependent on the relevance of the information. The latter is not supposed to be known.

To sum up part 2.2 concerning the constitutive process of information processing and information as a related object: information processing as a constituent procedure is inevitably impressed with an individual's cognitive capacity, acquired knowledge, experiences, and expectations. It follows from this that first and foremost the behaviour of agents involved in the financial market cannot be forecast by the delivery of information from the central bank without considering how this *information as a related object* will be acknowledged or understood by the public.

2.3 The interaction dimension

I turn now to the second dimension of the conceptual framework of communication. Although it may be somewhat irritating to differentiate interactions from context because all kinds of interactions take place in a changeable context, I would nevertheless propose this distinction for the sake of clarity. Interaction can be distinguished into theories which deal with the interdependence of *structure and actions* and theories which focus on *understanding* and judgment. As I have already emphasized, the modern view no longer presumes that central banking works against the market but rather *'through the market'*. The aim of this chapter is to link this (*through the market*) to communicative interaction, hence to language and speech. The consequence is that central banking must focus on the interactions between structures and action. Since interactions are based on the use of language, the central bank must analyze the communicative interactions.

2.3.1 The interdependence of structure and action

The central bank's context is an ingredient of the communicative interactions among agents in the financial markets. This context is also framed by the phenomenon of 'double contingency' regarding the interdependency of the agents' expectations. The term 'double contingency' emphasizes a pattern of social interaction of two interdependent persons – as a minimum. It emphasizes that communication is in no case a one-way street. Paying attention to communicative *interactions,* that is, to the 'corresponding person', is implied by 'double contingency' (Parsons 1961). The consequence is that views of communication in which meaning and understanding are supposed to be given as representations of the sender's mind or the sender's mental state are insignificant.

In the light of the 'double contingency', I would like to add that communicative interactions of agents are described as social interactions

that arise out of people's articulated interdependency. The expectations, wishes, intention or information are *articulated* expectations, *articulated* wishes, and *articulated* information – and, hence, related to others. Expectations, wishes, intention, and information are not hidden mental states (Muchlinski 2006).

The theoretical framework to approach communicative interactions also entails the acknowledgement of *intersubjectivity* (Fullbrock 2002). The term intersubjectivity is not restricted to the interactions of people. Current research in organizational theory and institutional economics emphasizes the interdependencies of institutional structures and communication as a mode of intersubjectivity – for instance, 'structuration theory' as propounded by Giddens. 'Structure is not "external" to individuals…; it is in a certain sense more "internal" than exterior to their activities in a Durkheimian sense' (1984, 16). According to Durkheim, sociological and social procedures are not rooted in psychological states. They are rooted in social interactions. Individual agents and collective agents communicate through their actions and interactions. By this they also build and rebuild structures in social context. Giddens: 'Structure, in its broadest sense…should be understood as rules and resources, recursively drawn upon and reconstituted in the process of interaction.'[5] He argued similarly to Wittgenstein, who had emphasized that the term rule as applied to a social context is not bounded by definition; that is, rules exist not by definition, but by practice. Following a rule and acting in context therefore implies *creating the rule by acting.*

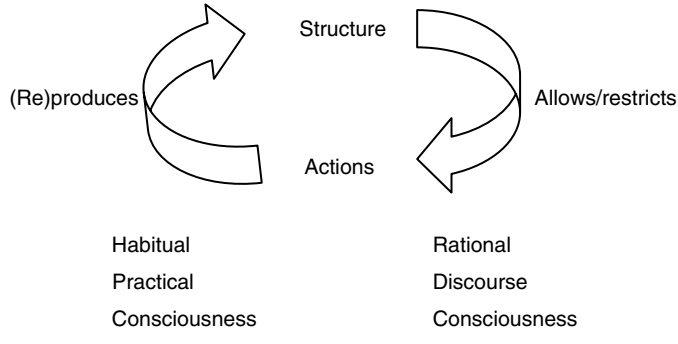
Social practice implies acknowledgement of the modes of acting, that is, the language activities and knowledge of procedure in social practice:

> In analyzing social relations we have to acknowledge both a syntagmatic dimension, the patterning of social relations in time-space involving the reproduction of situated practices, and a paradigmatic dimension involving a virtual order of 'modes of structuring' recursively implicated in such reproduction. (Giddens 1984, 17)

Acting agents do not merely produce but rather reproduce and shape the situation. By acknowledging their own experience and acquired knowledge, they configure the paradigmatic environment which frames further actions.

In contrast to macroeconomics, where conveying information through communicative acting has been neglected, the sociological approach to research of organizations and institutions in the 1970s

defines the actions of institutions as social practice or social interactions (Sydow and Windeler 2000). The communicative interaction of agents in organizations, institutions, and markets encompasses hermeneutic principles and interpretative schemes. The following diagram shows that structure is not externally given, rather it is dependent on actions and vice versa. This interdependency is of great importance for the approach to communicative interactions of central banking according to the modern paradigm of central banking. Giddens (1984) emphasized the interdependence of structure and acting that I wish to depict in the following graphic:



Giddens termed the interdependence of structure and action as the interdependence of 'micro-action' and 'macro-structure'. The agent's decision-making and interaction is framed by a macro environment that is influenced by the action. The graphic above makes it clear that the action is embedded in customs or habits and is also rational. Moreover, a particular action is based on habitual action in practice. Habitude encompasses the *body of knowledge*. This *embodied knowledge* or acquired knowledge frames rational action and is influenced by the habit. The relationship between the structure and the action is a gradually changing one. Whereas the habitual action is embedded in custom – that is, education, acquired knowledge, experience, and learning capacity – the rational action is oriented towards seeking a common goal in practice. The interdependence of structure and action also implies the interdependence of cognitive capacities. Practical consciousness is based on custom while discourse action is framed by modes of strategy and interactions.

The action necessarily takes place *in* social contexts which create and configure social structures, rules, resources, and institutions. By acting,

agents always focus the pattern of structures in social systems on reflective action. Giddens described this analogy with the use of language by following Wittgenstein's approach to language. The constitution of social reality and its maintenance by social interactions are based on acting and the use of language. For instance, Gidden's 'structuration theory' emphasizes the significance of the constitution of social institutions, rules, and resources by social interaction. It focuses on the interdependence of agents and institutions in practice. It is based on epistemic and theoretical meaning and inevitably connected with the use of language in practice. Giddens (1986) outlined his consideration on the use of language and action with clarity:

> Structure here presumes the idea of an absent totality. To understand the sentence which the speaker utters means knowing an enormous range of rules of a syntactical[,] ... semantical (and pragmatical) kind which are not contained within the speech act but are nevertheless fundamental to understanding it or to producing it. It is a parallel idea of structure (as an absolute totality) which I hold to be important as a concept for the social science as a whole, and as basic to the notion of duality of structure.

Reflexive action of agents in social contexts implies that agents neither analyze the grammar rules of language before using the language nor analyze the rules and resources in which social institutions are embedded before acting.

The act of sharing reactions, knowledge, and judgments among group members is not comparable with sharing an apple or bread by slicing it into equal parts. To diminish the whole into its parts implies eliminating it rather than creating the meaning and understanding in the communicative interaction. Sharing is not based on an explicit agreement or written document such as a consensus. Sharing is a procedure involving acting in the particular context and, hence, by the use of language.

What follows from this regarding agents in the financial markets? First: agents perceive and reflect their action in practice by adapting it to their wishes, motives, and expectations to develop meaning and understanding in a situation.

Second: agents use their base of acquired knowledge, experience, and emotions to recompose it through distinct experiences and cognitive procedures. They recompose a huge variety of perceptions, knowledge, and experiences in order to maintain their ability to act in a situation.

By acting, the agents form and reform their ways of acting and, hence, inevitably, the social structures.

I would like to add to Gidden's view a few considerations. The sociological point of view is relevant to economics, particularly to central banking *through* markets, because hermeneutic principles and interpretative schemes imply stepping beyond the view that concepts or the meaning of words and sentences, hence the understanding, are ontologically given or fixed. Economics and economists are used to working with quantitative methods and models which are based upon on exact definitions, deductive reasoning, and measurable entities. Any interpretative or hermeneutic approach is supposed to be superfluous or undesired. There seems to be a prevailing sense in most branches of economics that it has nothing to do with words, language, discussions, communication, and understanding. Interpretation is not needed because of the measured facts and data. However, facts, data, and measurements have to be described and interpreted as methods and, additionally, the means of their creation need to be explained.

As I have shown in Chapter 1, the measurement of monetary growth rates, or monetary aggregates, and the number of projected paths of monetary targeting were declared to be precisely defined. Nevertheless, it was insufficient to understand the new technique. In particular, the Volker era documents the switch to debate on whether and how the communication and language of a central bank should play a role.

For the sake of illustration I would like to move to another paragraph in the FOMC transcript of 1979. Volker explained that the projected path of monetary growth rates also implies the necessity of judging the development of the Federal Reserve funds rate and the decision-making of the public. Moreover, a deviation from the path implies the need to inform the markets about the implications of the new technique:

> I think we would attempt, probably not very successfully, to avoid telling the market if we hit the [constraint] in more normal circumstances or precisely what the range is. But they're going to by smelling around for it just as they do now and I don't know how successful we would be in avoiding that entirely. All I'm saying is that perhaps we can try to disguise the operations by doing them at a quarter point less or letting the rate go a quarter point or a half point above [the constraint] for a day or so. But the market is going to be feeling for where the top or the bottom of that range is if [the rate] goes persistently in one direction or another. And if it does, we can get in a situation, as I said earlier, where it's just going to lock itself against

> the upper level or the lower level and stay there. (FOMC Transcript 10/6/1979, 26)

Volcker accounted for the consideration that communication and discussion would change the situation compared with delivering information to the market. The FOMC sought to avoid an interpretative or hermeneutic approach by the market participants to its own strategy, a strategy which was neither fully explained nor described at that time, but was rather a 'smokescreen':

> There is an immediate advantage in the publicity; there is a disadvantage not very far down the road if people read this as a commitment and in fact we are not going to be able to live up to that commitment. (FOMC Transcript 10/6/1979, 27)

This FOMC quotation shows that discussions and language are elementary to the interdependence of structure and action. In contrast to other areas of macroeconomics, the modern view of central banking demonstrates that the interdependence of structure and action cannot be avoided. In fulfilling its mandate a central bank cannot ignore the market reaction as a response to its own action. It is important to acknowledge this interdependence and to leave behind the notion that central banking works on a linear input-output-relation between a central bank and the public. The 'base-drifts' of the FOMC, introduced under the Volcker era, document the constitutive role played by language and communication. Inasmuch as the traditional model view did not serve as a framework for monetary policy in times of stagflation, Volcker stepped beyond purely deductive reasoning models of monetary growth rate targeting and the premises of the monetarist view. As noted in Chapter 1, he assessed that era as a 'monetarist experiment in practice' and, hence, supported the view that money is not neutral.

The fear that talking to the public could be understood as a commitment to particular further decisions (as stated by Volker in the above citation) had been on the agenda of the Federal Reserve for a long time. Talks and communication, or at least explanations of HOW, WHEN and WHY the Federal Reserve was acting, were for a long time interpreted as an 'open mouth policy'. Communication and talks were interpreted through the lenses of the Barro-Gordon and Kydland-Presscott model view as impediments because the FOMC gave reasons to anticipate its monetary policy strategy, whereas the model view maintained that only unanticipated monetary policy matters. The Federal Reserve was

accused of not being able to act efficiently due to lost credibility and being merely a 'hostage to market sentiments'. Since it is impossible *not* to communicate through 'monetary mystique', the FOMC was compelled to learn to communicate its own strategy and view. Therefore, the FOMC – and of course other central banks which are not examined in this book – must respectively be seen as a learning organization or institution. The learning organization is a familiar figure in the modern literature on organizational learning and institutional economics (Sydow, Schreyögg and Koch 2009). This literature is concerned with questions such as how individual learning could become institutional learning and how interactions and communication create knowledge on an institutional level. The question of if a central bank should develop its strategy along a path of dependence or not is still in debate.

More critical is the idea that cognition and knowledge are *embodied* in structures, that is, organizations and institutions, which allow or restrict rational actions (King 2004). Organizational literature can be traced back to Weick (2009/1995), who introduced the organization as a 'sense-making system'. The sense-making procedure is seen in the interdependence of structures and actions. This also refers to the investigation of organizational evolution (Sydow 1992).

The intellectual roots of a learning institution are in analytical philosophical, for example, Gottfried Frege (1892), Bertrand Russell (1914), Ludwig Wittgenstein (1958) and psychological science, for example, Piaget (1974). In economics it is rooted in Hayek (1952). The reference to embodied cognition can be expanded by a reference to embedded recognition. Both frame the approach to communication as a communicative interaction. Whereas Wittgenstein emphasized the meaning of words and sentences, Frege and Russell introduced the distinction of sense (connotation, intension) and reference (denotation, extension). According to Frege, the 'sense' is the way in which something is 'given'. Given does not mean it is given like an object, such as a stone or car, but that it is given *by perception*. The reference is towards something which is given – perhaps one could say, established – *by* perception and, hence, it refers to an 'indeterminate' reference.[6]

Regarding the patterns of action, we can conclude that meaning and understanding comprise communicative interactions. According to the literature and central banking, it is not surprising that the implications of communicative interactions are recognized unavoidably in cases where communicative interaction fails unexpectedly. One illustration is when Bernanke, who was expected to bring clarity to the Federal Reserve's monetary policies as the new chairman, got into hot water

when he explained to a journalist in a private conversation that he had not turned dovish on inflation. This incident, which occurred during a time when financial markets were especially sensitive about tight monetary policy, provoked market uncertainty and media criticism.

A lot of media criticisms were also on the agenda during the Volcker and Greenspan era. Greenspan's way of communicative acting – his use of language – provides a good example for new and distinctive communicative interactions with financial markets. A lot of work needs be done here in order to evaluate it precisely. The 'Greenspan prose' (Sicilia and Cruikshank 2000, Woodward 2000), as his use of everyday language is labelled in the literature, initiates the perception of the Federal Reserve's environment by agents in the financial market. One important aspect should be underlined here. A significant pattern of Greenspan's communicative interactions was that he did not communicate through a coded language. Let us resume with this consideration here: since the Volcker and Greenspan era, the financial market has been learning how important the use of language is according to the pattern of monetary policy actions and how important it is to understand miscommunication.

Attempts to define the notion of communicative interactions are often linked to a description or to a definition of *mis*communication: a. lack of clear or adequate communication; b. an unclear or inadequate communication. (Coupland, Wiemann and Howard 1991) Similar to the term communication, the term miscommunication is imprecise and ambiguous. Due to everyday language, neither exactness nor non-ambiguity of the language in use is achievable (Taylor 1992). What follows from the misleading nature of communicative interaction can be seen for itself: 'By studying what has gone wrong when communication breaks down, we seek to understand a process that goes unnoticed when it is successful' (Gumperz and Tannen 1979, 307; Gumperz 1982).

Let us conclude this short consideration about miscommunication thus far: The process of understanding seems to be a process in which no doubts about the meaning of utterance emerge. Communication is always based on the reciprocity of space and time interrelated to people. One can refer here to the epoch-making work in social sciences and humanities on communication by Paul Watzlawick and co-authors (Watzlawick, Beavin and Jackson 1967). The authors investigated different kinds of situations, modes and forms of communicative interactions. Their results are persuasive if, for instance, we look to the history of the Deutsche Bundesbank until the launch of the European Central Bank (ECB). The Bundesbank (2000) communicated through a persistent

avoidance of explaining its decisions and policies to the public, that is, it communicated non-interactively. Even in the case of people or an institution, represented by its speaker or chairman, deciding not to respond – which according to Coupland et al. (1991) is interpreted as a non-*action* or non-*response* – this behaviour will be understood as a *particular* kind of communicative reaction regarding the theory proposed by Watzlawick et al. However, the miscommunication cannot be solved by a model of linear information transformation. As modern language scientists explain:

> 'The language use and communication are in fact pervasively and even intrinsically flawed, partial, and problematic. To this extent, communication is itself miscommunicative ... ', i.e. it is a misconception of what communication should be. (Giles and Coupland 1991)

Communication and language cannot be treated as an exact, unambiguous, measurable entity, which could be sent by a linear transformation. Therefore it is not an appropriate demand in social sciences. Consequences of this demand are expounded by Eisenberg and Phillips (1991).

This feature of communication is to be seen above all as an interactive process among the speaker and the other people involved, for instance the chairman of the Federal Reserve and the institutions in financial markets, respectively. Communication is an interactive procedure which inevitably also changes the communication structures and relationships among the participants.

What can be rationally presupposed regarding information processing is the following: Irrespective of their distinct motives, preferences, and different ways of perceiving and responding, agents in the market – like other people – are endowed with approximate similarities of responding or reacting. Otherwise no communicative structure in the world, no language, could be implemented and, hence, no success in communication could be achieved. To put it more concisely, no learning would be possible – not even the learning of a language. Agents in the markets act as real agents, who have certain motives, persuasions and perceptions of norms. Economic agents – like others – are compelled to perceive, learn, adapt, and also understand the actions of others in the market. They must perceive what happens from the actions and reactions of other participants in comparison to their own actions. The agents act on the communicative interactions, that is, on meaning and understanding. The agents' preferences are related and

embedded in interactions with other agents and, hence, they contribute to the evolution of norms.

Akerlof argued macroeconomists still neglect the fact that the preferences of agents are *not* fixed entities as presumed in macroeconomic theories. Whereas norms guide economic interactions, preferences and, hence, economic interdependencies, macroeconomics does not deal with such norms. What is important to note here is that norms and preferences are not rooted beyond economic interactions. While psychology and sociology deal with motives and preferences, these issues are not discussed in macroeconomic theory. Akerlof (2007, 19) puts it succinctly:

> Such preferences are a central feature of sociological theory, but they have been all but totally ignored by economists. Inclusion of such norms in utility functions makes Keynesian views of the macroeconomic consistent with maximizing behavior – the maximizing behavior of real people. It simultaneously invalidates each of the five neutralities.

Agents build up their expectations regarding market development, their preferences, and habitude. It is important to acknowledge that people assimilate their knowledge, reactions, and judgment in interaction with one another. Agents have no choice but to do so. What is correct for academic habitude or the rules of the game in an academic discipline is also true for the interactions in distinct realms, such as the interaction between the financial market and central banks.

Akerlof (2007, 4) refers to Bourdieu's work on habitus. Here I provide some brief textual evidence from Bourdieu's work. His work provides an accurate approach to different parts of societies, their cultures and capital. The expression capital is related to capability and capacity to develop skills and resources (Calhoun 1993). Bourdieu's (1984, 2005) analytic apparatus is composed of conceptual tools such as habitus, field, and capital. He described capital as a resource, that is, as a form of wealth that yields power to people – according to their adherence to certain classes, that is, the social position they hold. Bourdieu articulated the importance of the immaterial forms of capital such as cultural, symbolic, and social capital. He emphasized the possibility of converting one of these forms of capital into another. This mobility is part of his key concept habitus. He focused on a multiform kind of convertible capital or capability of participating in a game. Bourdieu outlined social reality not as the interdependencies of structures and actions,

but as a matrix of perception that occurs against the multidimensional background of different individual habitudes framed by social circumstances. He explained:

> The social world can be conceived as a multidimensional space that can be constructed empirically by discovering the main factors of differentiation ... by discovering the powers or forms of capital .... It follows that the structure of this space is given by the distribution of the various forms of capital, that is, by the distribution of the properties which are active within the universe under study – those properties capable of conferring strength, power and consequently profit on their holder .... These fundamental social powers are, according to my empirical investigations, firstly *economic* capital, in its various kinds; secondly *cultural* capital or better, informational capital, again in its different kinds; and thirdly two forms of capital that are very strongly correlated, *social* capital, which consists of resources based on connections and group membership, and *symbolic* capital, which is the form the different types of capital take once they are perceived and recognized as legitimate. (1987, 4)

Unlike cultural capital (education) or social capital (people's connections or networks), economic capital is 'immediately and directly convertible into money' (ibid). What directly follows from this to central banking as interactive procedure and macroeconomics is the following: agents in the market also aim to transform symbolic, social, and cultural capital into money, that is, higher earnings. Admittedly, this is a narrow view of economic motives; nevertheless, it is the reasonable view.

Bourdieu's treatments of cultural capital deals with two key issues: the 'social space' and the habitus. The social space is defined by the objective social position a person holds and by their 'lifestyle', which depends on the base of economic capital, cultural capital, and norms. Norms are differently defined and accepted as embedded norms in various social positions. He emphasized the interdependence of these different kinds of capital and people's endeavours to attain, arrange, and rearrange them. Bourdieu argued that a 'lifestyle' is rooted in the daily experiences of the individual regarding their dependencies on a particular social position. It is like an individual shaping their life. More importantly, 'lifestyle' indicates the preferences of the person and, hence, their social position. Preferences are perceived by others through actions. Preferences are part of the interactions and are rooted

in social position. Preferences and norms guide the interactions of people such as what should be read, consumed – goods, culture, material things – bought, learned, or done.

The concept of habitus indicates that lifestyle is influenced both by the social surroundings and the individual's interests. The objective moment or social surrounding encompasses historical patterns of the distributions of various resources and the trajectory of various agents in different social fields. The individual is driven by his/her own interests to attain a social position. These individual interests are both socially impressed and historically configured. The concept of habitus is a source for a strategy and linked to the social position as sketched in the previous paragraph (1984, 19). Playing a game is also a strategy to organize and coordinate social activities. Bourdieu's theory of interaction implies a way of developing and shaping the practice. Bourdieu defined habitus as follows:

> The source of historical actions, that of the artist, the scientist, or the member of government just as much as that of the worker or the petty civil servant, is not an active subject confronting society as if that society were an object constituted externally. The source resides neither in consciousness nor in things but in the relationship between two stages of the social, that is, between the history objectified in things, in the form of institutions, and the history incarnated in bodies, in the form of that system of enduring dispositions which I call habitus. (Bourdieu 1990, 190)

The concept of habitus is the *modus operandi* based on the past and acting out in present to shape a person's future within a social realm. The habitus,

> functions at every moment as a *matrix of perceptions and actions*, and makes possible the achievement of infinitely diversified tasks ... and (as) an *objective event* which exerts its action of conditional stimulation calling for or demanding a determinate response, only on those who are disposed to constitute it as such because they have a determinate type of disposition. (Bourdieu 1977, 83)

Bourdieu was concerned with the question of how different people act and struggle in different projects in order to improve their relations and different forms of capital to imitate the social fields they are part of. He explained that the pattern of social behaviour remains stable over a long time. Although the habitus is not a given, it cannot be changed all

the time. It is part of the acquired knowledge base due to the recognition and learning capacity of the individual:

> Each agent, wittingly or unwittingly, willy-nilly is a producer and reproducer of objective meaning. Because his actions and work are the product of a *modus operandi* of which he is not the producer and has no conscious mastery, they contain an 'objective intention' ... which always outruns his conscious intention. (1977, 79)

To sum up this excursus I would like to emphasize that norms and preferences are not changing all the time, because they are not given externally to the individual. As part of the individual which is embedded in social actions and structures, norms and preferences consist of inertia. Like the 'lifeworld' of Habermas, a habitus cannot be sold; that is, there is no way out of it but rather a continued reflection on the relation between the rules *and* history of institutions *and* the acquired knowledge base including persuasions, preferences, and motives. Whereas Bourdieu proposed a more pessimistic view on the matter of whether a habitus is changeable or not as time goes by, Habermas emphasized – according to his terms of lifeworld and language-based action and, hence, linguistic commitments resulting out of it – that any changes in lifeworld are part of the agreement and the discourse.

In Bourdieu's view, the coordination of social actions is described as a theory of action, which also draws attention to the concept of 'field' or the 'social space' impregnated by economic, cultural, and social 'capital'. However, at this point I would like to add that acting implies acting with others in the same field to attain social coordination based on communicative interactions.

2.3.2 Understanding and judgment

The previous paragraph can be amplified by an economic example which describes the importance of the agent's economic interactions, understanding, and judgment.

The assessment of knowledge about current market variables and the expectation-building process cannot be achieved by a deductive calculation, but by assumption. As Keynes argued:

> The existing market valuation ... is uniquely correct in relation to our existing knowledge of the facts which will influence the yield of the investment, and that it will only change in proportion to changes in this knowledge; though philosophically speaking, it cannot be

> uniquely correct, since our existing knowledge does not provide a sufficient basis for a calculated mathematical expectation. (Keynes, C.W., vol. VII, 152)

As Keynes explains, the agents in the market do not act as atomistic entities, but as aiming for an 'average opinion'. The perception of the 'average opinion' provides the basis for the decision-making procedure in the context of uncertainty (C.W., II, 156). The term 'average opinion' links individual knowledge to others. More importantly, it links the individual acting within the social context as an actor in the market. Gaining knowledge of the 'average opinion' of other agents is based on communicative interaction and, hence, on the language in use. The reliance on the 'average opinion' implies the agent's intent 'to devote our intelligence to anticipating what average opinion expects the average opinion to be' (ibid). What at first glance seems to be trivial has to be reflected upon as an elementary force in creating economic reality. Therefore, I propose the acknowledgement that some areas of economic realities are also created by communicative interactions. The financial markets in particular are driven by expectations of the future prices of heterogeneous market participants. These expectations are not mental states or thoughts, but rather actions in different contexts, that is, decision-making procedures in markets.

From the viewpoint of a Keynesian macroeconomic the financial markets reliance is based on 'average opinion'. It implies that one's motivation to make a decision to buy or sell financial assets will be always compared with the supposed knowledge and information other agents in the financial market are supposed to be endowed with. The Akerlof argument comes into effect here because the decision to buy or sell depends not only on one's own motivation but rather on comparisons with other agents or people. The individual interacts by focusing on his or her knowledge in comparison to the supposed knowledge of other agents. Keynes outlined the decision-making by the metaphor of 'beating the gun' in the

> 'battle of wits to anticipate the basis of conventional valuation a few months hence ... ' to describe the requirement of interaction in the market (Keynes C.W., VII, 156). This 'battle of wits' is anchored in conventional judgment of market procedures, 'it can be played by professionals amongst themselves.' (ibid)

Without such presupposed similarities between interacting agents in the financial markets or other epistemic and linguistic communities,

there could be no meaning and understanding at all. This is also true for the conveyance of information in a public sphere by a public institution (Littlejohn 1999). For example, the information given by a central bank to the public is addressed to different agents in the financial markets, different experts of the media and politicians. All of them have different motives and preferences. The release of information implies the creation of non-linear communication structures. A certain feature of the decision-making procedure and interaction in financial markets is that we share reactions, judgment and knowledge of other people in the linguistic community – or a professional language-game (Keynes). The term 'average opinion' is also addressed to an epistemic and linguistic community because knowledge is only linked to other people by language-based activities. Haas (1992, 3) defined the epistemic community as a combination of formal and non-formal characteristics:

> An epistemic community is a network of professionals from a variety of disciplines and backgrounds, they have (1) shared normative and principled beliefs, ... (2) shared causal beliefs ... , (3) shared notions of validity – that is, intersubjective ... criteria for weighing and validating knowledge in the domain of their expertise; and a common policy enterprise. (Haas 1992, 3)

In addition to those formal criteria, an epistemic community can be identified by certain personal criteria that members of the epistemic community are supposed to have in common:

> Members of an epistemic community share intersubjective understanding; have a shared way of knowing; have shared patterns of reasoning; have a policy project drawing on shared causal beliefs, and the use of shared discursive practices; and have a shared commitment to the application and production of knowledge. (Haas 1992)

The linguistic community can be described by a reference to analytical philosophy. Wittgenstein noted this in his *Remarks on the Foundation of Mathematics* (1983). He wrote:

> 'Language, I should like to say, relates to a *way* of living. In order to describe the phenomenon of language, one must describe a practice, not something that happens once, *no matter of what kind*' ... 'Interpretation comes to an end'. (Wittgenstein 1983, 335)

This brings us to John Searle (1969), who proposed theories focusing on understanding. Searle's key consideration was that the 'speech act' is guided by different constitutive rules.[7] The speech act theory focuses on different types of speaking activity – for instance, asking, maintaining, requesting, begging, greeting, praying, promising, or proselytizing. In using words, the action itself is implemented. According to the speech act theory, an utterance should be seen as a composition of different components of expression. Although language plays an important role in creating institutional facts, such as money, wedding rings, identity cards, passports, driving licenses, and so forth, the later Searle (in the eighties) denied that all institutional facts are composed or textually composed by language or by speech acts. Sentences and speech acts possess a meaning and also a semanticity. They contain conditions of truth and of fulfilment. The fulfilment is not ontologically enforced, but through acceptance by society. This acceptability can only be created by a commitment from society. Wedding rings, identity cards, and driving licenses are also to be seen as indicators of a particular status, which also implies demands of fulfilment (Searle 1995). Like the later Wittgenstein, Searle also expounded that 'speaking a language is engaging in a (highly complex) role-governed form of behavior'. Speaking a language is not simply the use of words or its additive composing to a sentence as a whole, but speaking a language is 'a part of a theory of action' (Searle 1969, 17).

One striking failure of Searle's view was that his proposed decomposition of the different types of speech acts according to their assumed presumptions, intentions, or consequences should be investigated as a conceptual connection of different kinds of communicative interactions and not as isolated elements. To provide an analysis of a particular speech act, therefore, requires investigating the underlying interactions as a whole, that is, as a procedure arising out of the manifold of interactions. Searle abandoned his goal of analyzing the different relations created by speech acts, mainly because he accepted that it is not possible to judge all speech acts. The creation of speech acts is infinite. Speech acts are created differently in different contexts by different people. They are not listed in a catalogue. However, an understanding of future speech acts is not possible. This understanding is not achievable by a decomposition of a future differentiated sequence of its components. Inasmuch as the use of language is not to be seen as the reconstruction of the mental state or thought, the use of language itself configures the context of actions, the actions of central banks.[8]

Searle stated that speech acts were supposed to entail all possible ways of acting. He tried to differentiate all types of utterances in a classification of speech acts and its presumed effects. Criticism of this classification and its assumptions led to an abandonment of the speech act theory in the 1960s and 1970s. In his later work Searle picked up Wittgenstein's consideration of the rules which permeate our life pattern and tried to develop a conceptual differentiation of his approach to language as a way of acting (Tsohatzidis 2007). Since the investigations by Wittgenstein in the late 1920s, it has been more widely accepted that the way of speaking is also a way of acting. This view acknowledges the constituent role of language.

It is necessary to refer to the acquired knowledge of the world that agents have. It implies that the status of beliefs, persuasions, intentions, and expectations of both the speaker and the hearer are dependent on the context of the inquiry. It follows from this that the meaning of a sentence is neither given by the speaker's intention and mental state, nor by a recomposition of separated words. To share the understanding or judgments of other market participants implies participating in the language-game. Wittgenstein described a 'language-game' in his *Philosophical Investigation* as the way of using language, which is clearly a way of interacting:

> Here the term 'language-game' is meant to bring into prominence the fact that the *speaking* of language is part of an activity or of a form of life. (Wittgenstein 1978, § 23)

This mode of *interaction, that is, sharing the reactions, knowledge, and judgments* of members of a group leads to the evolution of meaning and understanding. Take, for instance, the evolution of a rule. A rule created for the financial market needs to be shared by other agents in the market, that is, it is based on communicative interactions. Only a shared rule can acquire its functions as a rule in practice. I turn to this point in Chapter 5.

The theories of understanding and judgment are also treated as modern constructivist theories in the literature.[9] Modern constructivist approaches have focused on information as a related object (Gastil 1995; Lang 2000). They attempt to explain information transmission as information created based on coordinative efforts by the sender and receiver, which encompasses the inevitable modes of syntactical structures and paradigmatic dimensions. Any information is constructed information since it is a result of communicative interactions. Because of the huge

and heterogeneous variety of constructivist theories on communication, it is not possible to go into detail here.[10] Modern research acknowledges the cognitive limits to steering or controlling a person's attention as a key consideration and leaves behind the assumption of perfection in human behaviour. Moreover, it acknowledges a person's supposed limited information processing capacity.

Theories of understanding and judgment, or modern constructivist theories, emphasize the role of the hearer or interpreter and try to recognize cognitive capability based on the acquired knowledge, experience, and interpretative efforts of participants to process the received information. One of these theories is introduced here as theories concerning *Verständigung* (Habermas).

The translation of *Verständigung* into English is controversial in the literature and need not be discussed here. According to Heath, the term *Verständigung* suggests both understanding *and* agreement (Heath 2001, 320). Whereas it is without a shadow of doubt that the use of language seems to aim for understanding as, for instance, Davidson argued (we communicate in order to be understood by other people), it remains controversial whether the use of language also inevitably aims towards an agreement. In this sense, agreement does not refer to the view that language is used only to bring about agreement. However, it was Donald Davidson (1984, 183–198) who worked on the function of language as both agreement and understanding in his essay 'On the very Idea of the Conceptual Scheme'. I will come back to this issue in later on.

Habermas explains understanding as the means of grasping the epistemic relationship of speech acts. The concept *Verständigung* encompasses both the theoretical approaches to patterns of communicative interactions and to patterns of understanding and judgment by focusing on the communicative interaction of both the speaker and the hearer. According to Habermas, meaning is a result of the interactive acknowledgment of an illocutionary act in which the knowledge of agents is embedded. He discussed two criteria which should be assumed as given in the case of a successful acknowledgment: a) the hearer knows the conditions under which the expressed sentence should be accepted as truth, and b) the hearer knows the conditions under which the speaker possesses certain reasons to accept an expression as truth. Habermas modified the 'speech act theory' as introduced by Austin (1962) by revising the two elements of the speech act theory, the *illocutionary* and the *perlocutionary* element. He combined the modified speech act theory with a model of social action based on language.

Habermas's (1984, 1987) approach to understanding and communicative interaction should be acknowledged as a welcomed complement to economics. He made a shift from a practical analysis towards a communicative analysis. He introduced the 'linguistic turn' in sociology, which is of great relevance to economic sciences as social science regarding communicative interacting in particular contexts, that is, the markets. Until that time the mainstream of sociology had discussed – as the mainstream of economic theory is still doing – the presumed shared motivational aspects (for instance norms, rules, and values), without referring to the constituent role of language.

To be brief: the 'linguistic turn' relegated the traditional scientific view to the past, which stated that individuals act in isolation with individual experiences and intentions guided by individual preferences. The 'linguistic turn' acknowledges that individuals create meaning by interaction, that is, by the use of language. Moreover, it is part of social acting. Rorty described the implications and consequences of the 'linguistic turn' to sciences with reference to Wittgenstein's approach to the constituent rule of language (Rorty 1967/1992; Trabant 2003). The use of language is impossible in private only because it is not possible to use a private language in order to be understood. The use of language is to be seen as a public good; it refers to a 'language-game' (Wittgenstein). Therefore it is important to focus on communicative interaction, which itself is designed and impregnated by the acquired knowledge base, the cognition or recognition capacity and the way language is used in context (Hodgson 1988). Individuals or agents act within language-games. Any use of words or sentence is part of a language-game.

Habermas's approach to understanding is important to innovations in central banking because his modified speech act theory as a model of social action based on language being the 'ultimate source of validity' departed from the image of an isolated agent who acts according to his or her own preferences, wishes, knowledge, and beliefs. Social acting is inevitably within social contexts and institutional structures and actions. The person is embedded with social experience and motivated to gain social acceptance instead of individually maximizing utility only.

Economic interdependence of structures and actions should be discussed using communicative interaction within contexts of the knowledge base. Moreover, acting in economic markets is a way of coordinating action in different markets based on the division of labour, which requires the use of rituals to come to an understanding. The individual interprets social actions, which evolve out of social interactions,

to coordinate or to act. To understand or explain social interactions and economic phenomena, one is therefore required to reconstruct the communicative interactions of economic agents, which are based on the acquired knowledge base, experience, and motives. As already outlined, the acquired knowledge base is not an individual knowledge base, but a combination of individual skills for relating to the social environment.

Moreover, the 'linguistic turn' points to constitutive rule of language use in social sciences to rebuild those theories that explicitly or implicitly still rest on the presumption that language is just to be seen as a mirror of thoughts. Habermas emphasized that individual behaviour and acting should be seen as based on the use of language within social routines, 'epistemic communities' (Haas) and social expectations. As outlined at the beginning of this chapter, the action does not start at point zero. Acting in financial and economic markets is oriented towards both the evolution of new and existing institutional facts, knowledge, patterns of articulation, and interpretation. Actions in markets are perceived in light of the average interpretation, which links individual opinion or judgment to other agents in the market. The underlying premise is that individual action is not rooted in the individual agent, but in learned, socially trained, and constructed routines of interpretation.

Habermas's communicative theory of action deals with the modes of understanding arising out of interactions. Language is discussed in its function as a shared good. Decisions and actions of agents are linked to culture, practice, and institutional facts. A social network provides the background of acting, but is also created by social actions, since it frames selective perception and the use of language, and therefore the sense or meaning. Habermas's approach to understanding and judgment implies the creation or evolution of public commitment based on language interactions. Public commitment comes into consideration because through the use of language a public commitment has been created. Language is not private property. Hence, success in the coordination of expectations is made possible by articulation or communicative interactions. Achievement of a common goal imposes further constraints on the participants. This is exactly what gives importance to elucidating the role of language in economic theory due to engendered public commitments and accountability as well as the need to coordinate expectations of market agents.

As a model of communicative interactions in social science, Habermas's contributions provide incentives to the academic debates on central banking and interactions in economic markets. In focusing on the context of communicative action, he also draws attention to the

need to aim for acceptance and commitment by market participants. Agents in the market are not described as isolated, atomic individuals, but as social persons who aim for mutual accord based on trust, and who strive for a common understanding in order to achieve a common goal. Habermas stated that a speaker's intention cannot be transmitted to the hearer's understanding.[11] He objected to Searle's assumption that the intention of the speaker provides the meaning of speech acts. He developed a map of epistemic connections based on his view on the pragmatism of communication.

Habermas followed the modern view of language science by acknowledging that there is no distinction between the knowledge of language and knowledge of the world. It was Wilhelm von Humboldt and later Ludwig Wittgenstein who elucidated the importance of the use of language regarding the evolution of meaning and understanding (Trabant 1998; Trabant and Ward 2001). Also Wittgenstein explained that language is not a medium which is just the label of thoughts, since 'the language is itself the vehicle of thought' (1978, § 329). Language is not neutral towards thoughts. Since we cannot separate the semantic aspects from the epistemic aspects of language, it makes no sense to look at speech acts as atomic entities or as hidden entities supposedly rooted in the mental states of individuals. There exist no single 'beliefs' or 'intentions' of a speaker which give meaning to the sentence as indicated by Hume (1978) and Hobbes (1991). Hume and Hobbes stated that 'beliefs' and 'desires' have significant roles for the motive and success of an individual's action.

Habermas discussed language as a medium to coordinate the agent's mutual accord in order to achieve a common aim. More precisely, the mutual accord is based on the presumption that both speaker and hearer aim at a mutual understanding as 'the inherent telos' of any communication. Any speech act demands a mutual understanding (Habermas 1984, I, 293). Since people do not communicate in order to be misunderstood or in order not to be understood by the other person, Habermas set mutual understanding as a normative criterion. It is irrational to assume that efforts at communication are motivated by the wish not to be understood. Any language interaction encompasses accountability and commitment because acceptance of the utterance depends on the other person. Habermas outlined that speech acts are 'discourse commitments' and as such mutual agreements. Language imposes constraints because it constitutes social norms or rules. The meaning arises out of the interactive acknowledgement between the speaker and the hearer. The key notion of their

interactive acknowledgement is the 'binding and bonding force of a speech act'. Habermas explained:

> A speaker owes the binding ... force of his illocutionary act not to the validity of what is said but to the coordinating effect of the warranty that he offers: namely to redeem, if necessary, the validity claim raised with the speech act. (1984, I, 302)

These 'binding and bonding effects' underlie all communicative interactions. They are rooted in the constitutive role of language and also in the interdependence of the semantic and epistemic. It is this premise which leads Habermas to describe speech acts as a web of epistemic connections. A speech act cannot be isolated from other speech acts. The epistemic map provides an inherent connection between the meaning of an expression and the validity due to a person's cognitive capability. Speech acts, as an epistemic web, constitute the meaning of an expression.

I would like to add that this epistemic web must be founded on the presumption that speech acts are based on a shared – that is, a non-private – language. Therefore, language is to be viewed as having a constitutive role and not as being a veil of thought within the web of speech acts as stated by Heath (2001, 27). According to Habermas, speech acts are described as the continued attempts to reach an understanding. Reaching an understanding implies accepting language as the 'ultimate source of validity'. As particular elements of communicative actions, speech acts possess a compelling function since they bring about commitment and accountability. Knowing the prerequisite for an acceptance of speech acts is equivalent to recognizing the self-commitment of both speaker and hearer regarding 'validity claims'. Such 'validity claims' are norms, that is, social constructions, but neither values of the individual or individual mental states nor private. As social norms they attain validity through language-based interaction. In contrast to Bourdieu and classical sociology, Habermas (1998, 198) stated:

> If understanding a speech act depends on knowing the conditions for its acceptability then the speaker's illocutionary aim of being understood points to the further aim that the hearer should accept her speech-act offer. The acceptance or the agreement on the part of the hearer is equivalent to recognition of a validity claim raised by the speaker. It is based on the good reasons that the speaker offers in order to redeem the validity claim in discourse (or else on a credible warrant issued by the speaker that she could provide such reasons,

> if necessary.) And the hearer, with his 'yes' to a validity claim he has accepted as worthy of recognition – that is, with his acceptance of the speech-act offer – also takes upon himself, as a rule, certain obligations relevant for the sequel of interaction, such as obligations to meet a request, to trust a confession, to believe a statement, to rely on a promise, or to obey an order.

Validity claims arise through utterance or articulation. They are inherently connected with the use of language. To raise validity claims indicates that a speaker's utterance is not simply a veil of his intention, thought, expectation or desire, but articulation (Muchlinski 2006; Moyal-Sharrock 2007, 2000). The meaning of a speaker's utterance is not compositional. The epistemic connection or the meaning of a speech act is not something which has been added to the speech act later on. The embedded epistemic web is determined by its meaning. As Brandom (1994, 494) stated, 'communication is the social production and consumption of reasons'.

Understanding a speech act implies knowing the reasons for certain validity claims. Habermas wrote:

> We understand a speech act when we know the kinds of reasons that a speaker could provide in order to convince a hearer that he is entitled in the given circumstances to claim validity for his utterance – in short, when we know *what makes it acceptable*. (1998, 232)

What, then, makes it acceptable? Of course it is *not* the intention of the speaker that indicates the acceptability of an utterance. There must be supporting reasons that indicate the acceptability of an expression. The speaker and interpreter are part of the epistemic web which itself is the 'binding force'. The agents are embedded in the epistemic web, and it is for this reason that an utterance is to be seen as a 'weave' because the concepts we use in daily language are not used for a unique occasion. It was Wittgenstein who made clear that a notion is not a pretence which accompanies the intention, thought or expectation (Wittgenstein 1967, § 568, 569). The validity claims occur through utterance or articulation. Raising validity claims also incurs commitment by the speaker through the performative effect of the speech act. According to the epistemic web, any utterance appears to incur commitment with regard to further utterances.

Habermas distinguished the validity claim into three types of commitment: (1) truth, (2) rightness, and (3) sincerity (1984, I, 278).[12]

Whereas truth refers to the perceived world or situation, rightness refers to the perception within a social context and sincerity to an individual's realm of experience. By this differentiation, Habermas outlined his modified approach to speech acts and, hence, communication interactions as a non-linear but rather as a complex relationship based on internal and external considerations of the agents. The commitment to truth or to rightness has also to be understood as a realistic viewpoint according to the social environment. Insofar as the speaker and hearer share this realistic viewpoint if follows from this their willingness to coordinate in order to reach a common understanding.

It is worth noting here that the presumption Habermas proposed is *not* that every speaker and hearer harmonically coincides in their 'lifeworld' or views, but rather that they are trying to be successful as long as they are trying to communicate. The 'telos of communication' (Habermas) aims at the mutual understanding of both speaker and hearer. Therefore the key consideration of Habermas's view is this coordinative interaction based on the 'binding and bounding force of a speech act'.

In the case of 'communicative action ... the consensus achieving force of linguistic processes of *reaching understanding* (*Verständigung*) – that is, the binding and bonding energies of language – becomes effective for the coordination of action' (1998, 221). Whereas Habermas once had ascribed the 'binding and bonding forces' to speech acts, he now addressed it to the process of understanding an emphasis on the role of language as 'shared goods' and as an explicit coordination mechanism. He stated that the meaning of a sentence cannot be found beyond the communicative interaction since any communication interaction is based on mutual commitments in the context.

It follows from this differentiation that speech acts lead to commitments. If agents know the acceptable conditions, they also know the reasons or evidence that both the speaker and the hearer will support, that is, the participants know the conditions under which the statement can be judged to be true and right. Moreover, they recognized the conditions of sincerity. This is why a speech act gets its own claim to validity: because it reflexively refers to its propositional content. Furthermore, it is assumed that all participants in communicative interactions have the ability to judge the epistemic commitment. Habermas defended the outlined differentiation of three types of commitment – truth, rightness, sincerity – as a pragmatic pattern of judgment concerning different communicative actions (1984, I, 319f.).

Habermas basically follows an 'inferential semantics approach' because it is not possible to separate the understanding of an expression from its

circumstances. This argument was made by Dummett (1981). The term 'inferential semantics' is a key notion in language sciences describing the view that the truth of a sentence is not inherent to the words the sentence is composed of, but to the context the sentence relies on. No falsification or verification nor different methods of proving the truth or falsehood are required or judged from the sentence. The sentence refers to the context and not to a catalogue of criteria or rules. Knowing the rightness condition or truth condition of a sentence means knowing the circumstances of the sentence. Knowing implies – as Michael Dummett called it – the 'descriptive content' (1976). Knowing, therefore, implies the *pragmatic point of view* Habermas emphasized in his approach to communicative interactions. The truth condition encompasses the rightness condition regarding the evocation of the meaning of the utterance and the consistency of the validity claims.

By participating in communicative action with speech acts, we get involved through the commitment of our utterances and action ('matching deeds to words'; 'we do what we say and we say what we do'). Later on Habermas (1996) précised that a communicative action implies a mutual understanding as a certain mode of action coordination, therefore the validity claims gains relevance for the creation of social orders, too, that is, validity claims are to be seen as normative. Participating in communication implies social involvement as well as social obligations. The amount of commitment depends on the different kinds of speech acts. Habermas differentiated between the types of speech acts in which a) statements are to be seen as assertive, b) a weak communicative action as expressive and c) a strong communicative action as regulative. In case of any dispute about the three validity claims, the speaker or the hearer is forced to demand a 'rational discourse' according to the 'telos of communication'. The assumption of rationality does not impose the obligation to act rationally rather it aims to achieve corporative acceptance and agreement through any speech act, as long as the presumption that communicating occurs in order to be understood – is actually the case. The rationality assumption is neither an empirical proof nor a description. In daily life we normally do not ask for reasons or justification as a guideline for communicative acting, we share persuasions and 'lifeworld'. This is the way understanding works – a view which is also supported by language philosophers like Davidson and Wittgenstein.

At this point the Habermas concept of 'lifeworld' enters the game. It entails certain assumptions concerning the private, cultural and public part of society as well as its rules and institutional facts. Individuals aim

for mutual understanding by coordinative interaction. The concept of 'lifeworld' materializes the counterpart to the constitutive premise of rational discourse as outlined on the previous pages.

Habermas assumed – as also Davidson et al. – any discourse follows rational criteria because we want to be understood by others. Although different discourses are motivated differently – and of course many discourses are not based on symmetry, but rather on hierarchies and, therefore, asymmetric power – it is necessary to anchor decision-making and action as rational actions. Reaching an understanding implies reference to the 'lifeworld' in order to redeem validity claims. Communicative actions provide a framework for understanding and the force for reshaping the 'lifeworld' in order to diminish the reasons for a dispute (Habermas 1987, II, 63). To achieve any understanding, the speech act must be interpreted as based on a common language and on coordinative acting that allow the speaker and hearer to grasp the meaning, to understand.

I now turn briefly to the role the interpreter plays in Habermas's view. The interpreter is the hearer. Habermas described the interpreter as a participant of the context, in which he/she must imagine the motives of other agents in that context. The interpreter, therefore, must anticipate the objection or agreement of others. Being themselves part of the situation, the interpreter cannot judge beyond the reasons the speaker articulates. The interpreter evaluates the reasons of the speaker according to the context. In short, the interpreter must reconstruct the reasons other agents have put forward in order to understand and work out a 'rational interpretation'. Habermas explains this consideration as follows:

> The interpreter cannot become clear about the semantic content of an expression independently of the action contexts in which the participants react to the expression in question with a 'yes' or a 'no' or an abstention. And he does not understand this yes/no position if he cannot make clear to himself the implicit reasons that move the participants to take the position they do. ... But if, in order to understand an expression, the interpreter *must bring to mind the reasons* with which a speaker would if necessary and under suitable conditions defend its validity, he is himself drawn into the process of assessing validity claims. (1987, II, 115–116)

Without a doubt, Habermas was influenced by Davidson as well. Among other proponents of theories concerning *Verständigung*, Davidson refers to a principle that is explained in the following paragraph.

In the 1980s Davidson emphatically developed the role the interpreter should have within the process of reaching understanding. The success of communication depends on neither the truth of a sentence nor the application of categories of truth. In his later work Davidson suspended the reference to categories of truth. He argued that categories of truth are not to be found in a list or catalogue but only in a theory of interpretation because any criteria of truth is rooted in dialog. This is not a point of controversy between Habermas and Davidson. The success of communication depends on the continuity of judgment of the interpretative theory of truth. Davidson's aim is to develop the understanding of the utterance of the speaker through a theory of understanding. Davidson did not differentiate between a theory of interpretation and a theory of understanding because he assumed the success of communication is identical with the success of interpretation. Davidson introduced his method of interpretation based on the 'principle of charity'. He wrote:

> Since charity is not an option, but a condition of having a workable theory, it is meaningless to suggest that we might fall into massive error by endorsing it. ... Charity is forced on us; whether we like it or not, if we want to understand others, we must count them right in most matters. (1984/1973, 183–198: 197)

This principle of charity is a necessary application for the interpreter to achieve a maximum of agreement between speaker and interpreter. Davidson argued: 'I apply the principle of charity across the board. So applied, it councils us quite generally to prefer theories of interpretation that minimize disagreement' (1984, xvii). This principle should be read as a guideline for any interpretation. Davidson first applied it to his model of a 'radical interpretation'.

What is meant by 'radical interpretation'? Davidson introduced a situation as radical for the interpreter if there exist no common language, no common experience, and no dictionary support in which both speaker and hearer first meet and need to understand what they have observed. Despite this strange – but not impossible – situation, both the speaker and the hearer need to strive for a common understanding. They must develop an understanding of the way one person understands the observation and interpretation by the other person. Davidson (1984/1973, 125–140: 128) wrote,

> In radical interpretation, however, the theory is supposed to supply an understanding of particular utterances that is not given in advance,

> so the ultimate evidence for the theory cannot be correct sample interpretation. To deal with the general case, the evidence must be of a sort that would be available to someone who does not already know how to interpret utterances the theory is designed to cover: it must be evidence that can be stated without essential use of such linguistic concepts as meaning, interpretation, synonymy, and the like.

Insofar as the old concepts are not applicable to understanding the new situation, the understanding of the latter is rooted in the interpretation of the behaviour of the other person. Underlined by the presumption that we talk because we want to be understood, Davidson outlined the situation of radical interpretation to discuss the efforts of both speaker and hearer. Davidson stated:

> Without this sharing of reactions to common stimuli, thought and speech would have no particular content – that is no content at all. (1991, 153–166: 159/160)

What at first glance seems to be a simple behaviourist approach to the human condition neglects the implication of the use of language. Davidson responded: 'I despair of behaviourism and accept frankly (a speaker's) intentional attitudes towards sentences, such as holding true' (1984/1979, 227–241: 231). Davidson did not rely on J.B. Watson's behaviourism and the mechanism of a stimulus-response reaction. Davidson argued that

> 'behavioral grounds are well we have for determing what speakers mean' (1991, 153–66: 162).
>
> What makes this step convincing within in his overall argument is to emphasize that any utterance and therefore judgment is inherently connected with a person an not with a pendulum.
>
> 'We have still to say what evidence is available to an interpreter.' (1984/1973, 125–140: 134).

The evidence cannot consist of detailed descriptions of the speaker's belief and intentions. Furthermore, the interpretation is not dependent on beliefs, desires, and meaning of either the speaker or the hearer, that is, the interpreter. Beliefs, desires, and meaning are not simple cognitive attitudes in Davidson's view. Beliefs, desires, and meaning are interdependent and should be integrated by interpretation, which depends on the 'principle of charity'. In this, Habermas follows Davidson. The three validity claims of Habermas are not a simple cognitive approach, since

they are inherently connected in every speech act. Davidson emphasized the interdependence of beliefs, desires, and meaning as rooted foremost in the 'principle of charity'. This principle encompasses the correction of singular utterances in case of error:

> Making sense of the utterances and behavior of others, even their most aberrant behavior, requires us to find a great deal of reason and truth in them. (Davidson 1984/1974, 141–154: 153)

The principle of charity is rooted in the use of expression or articulation which is relevant to the other person as well. An important consequence of this principle is the indeterminateness of the interpretation, which implies that there is no further given meaning. The interpretation is created in the moment of action. Davidson stated that there exist 'trade-offs between the beliefs we attribute to a speaker and the interpretations we give his words' (1984/1973, 125–140: 139).

In order to explain the role of persuasions of the speaker and hearer, that is, the interpreter, Davidson proposed two further principles to achieve understanding: (2) the principle of coherence, and (3) the principle of correspondence. The principle of coherence should lead to a high degree of logical consistency in speaking behaviour. Davidson called this 'propositional attitudes' (1991, 155–166: 158). By this he basically demanded that both the speaker and interpreter work logically consistently. For instance, the interpreter reconstructs the speaker's sentences consistently by interpreting the sentences *1, 2, ..., n* unquestioningly. That means the interpreter reconstructs the entire utterance of the speaker, that is, the conjunction of the sentences, without any contradiction.[13] If sentence A implies x, and sentence B implies y, then the premise of non-contradiction implies that sentence C implies z. Davidson insisted on the principle of coherence in these terms: a) being consistent regarding both the speaker's and the interpreter's attitudes, both have comparable attitudes; b) the speaker and interpreter should behave consistently regarding their verbal and non-verbal attitudes and, finally, c) the relation of speaker and interpreter is to be described by a 'maximizing agreement'. The latter does not imply that both agree at all times in all communicative actions, but rather that both agree on the discourse they are involved in. Therefore 'maximizing agreement' can also imply a non-agreement as long as both acknowledge that they are participating in a shared world.

The (3) principle of correspondence defines a shared world of both speaker and interpreter, which means both have access to the same

situation or circumstance. Given this, the function of the interpreter is to assign the speaker's utterance to the objects of the world. Davidson explained that the theory of action can be interlocked with interpretation if all three principles, and the above outlined three criteria a), b), and c), are satisfied. Furthermore, these principles – charity, coherence, and correspondence – include two more criteria: (d) the real world exists, and (e) the world is discernible and accessible for both speaker and interpreter.

Another quotation might provide more clarity on the principle of correspondence, because a formal criterion is not meant to bring out the correspondence of a logical deduction as proposed by Tarski (1956) (*convention-T*). Davidson explained:

> Knowledge of the circumstances under which someone holds sentences true is central to interpretation. ... (I)n case of language, although most utterances are not concerned with truth, it is the pattern of sentences held true that gives sentences their meaning. (1984/1975, 155–166: 162)

Davidson emphasized the attitude of *holding* a sentence to *be true or accepting is as true* as crucial for any interpretation (ibid, 161). This presumption also refers to beliefs and persuasions shared by the speaker and interpreter. Both create context through their beliefs and persuasions. Davidson wrote:

> The attitude of holding a sentence to be true (under specified conditions) relates belief and interpretation in a fundamental way. We can know that a speaker holds a sentence to be true without knowing what he means by it or what belief it expresses for him. But we know he holds the sentence true *and* we know how to interpret it, then we can make a correct attribution to belief. Symmetrically, if we know what belief a sentence held true expresses, we know how to interpret it. (ibid, 162)

Both principles – coherence and correspondence – should lead to a comparable behaviour of the speaker. It should allow the integration of a new hypothesis of interpretation by the role of the interpreter, that is, the hearer. The interpreter, who is the dominant figure in the process of understanding, tries to discern the speaker's utterances via a language-based emphatic and cognitive process. Davidson called this non-verbal and 'verbal attributes of attitudes' (ibid, 166). Since the above three

principles are normative claims for achieving an understanding, they are a way of defining an ideal, workable, context for the communicative interaction and interpretation. Davidson outlined his view as follows:

> A theory of interpretation, like a theory of action, allows us to redescribe certain events in a revealing way. Just as a theory of action can answer the question of what an agent is doing when he raised his arm by redescribing the act as on of trying to catch his friend's attention, so a method of interpretation can lead to redescribing the utterance of certain sounds as an act of saying that snow is white. (ibid, 161)

There is no contradiction here to Habermas, Wittgenstein, or Wilhelm von Humboldt. 'Language [is]...intrinsically social' (Davidson 1994). Language allows one to describe the behaviour of the speaker and interpreter, which leads to successful communication (Davidson 1992, 256).

Habermas and Davidson have in common the acceptance of the 'inferential role' instead of the application of categories of truth. Understanding is based on the 'inferential role' because understanding refers to communicative interaction and the context, which are relevant to institutions (North 1990).[14] To sum up this chapter: in contrast to Davidson, I would propose defining the principle of charity as a principle of commitment, which also better expresses the interdependence of the speaker and hearer and steps beyond the predominance of the interpreter found in Davidson's view.[15]

The communicative principles Habermas introduced should be seen as fundamental for all participants in discourse: Every individual is competent to talk and to express his or her beliefs, preferences, and expectations. The result of such a discourse would be that all participants have equal capabilities, rights, and competence. This view of discourse has provoked massive criticism of Habermas's theory of communicative interacting (Moon 1995).

To discriminate between Bourdieu and Habermas, I would like to emphasize that the evolution of the norms and values and, hence, the elaboration of social identity, are not deduced from shared motivation or a shared social situation but rather from a shared world. The crucial point is that this shared world includes language interaction priority and this necessarily leads to another approach to social reality, which is described by the 'linguistic turn'. Regarding economics as a social science one has to consider that people judge economic decisions in certain social situations, which are influenced by norms and

shared values of living, or 'lifeworld'. According to Habermas the latter is to be grasped as the creation of language-based interactions. It is this language-based approach to social norms and 'lifeworld' Habermas consequently worked on, which make a wide distinction between classical sociology and the communicative approach to social science. Therefore, macroeconomics should integrate the concept of habitus to replace 'abstract derivation' (Akerlof 2007) with preferences which are linked to the contemporary world.

Here it should be accepted that Habermas introduced the consideration that individuals are endowed with equal capability, rights, and competence as a normative concept. He did not provide it as an empirical proof. Communicative interaction includes the acceptance of rational action by all participants as *a prerequisite to communication*. Habermas left open how this acknowledgement could be achieved; that is, he did not explain the speaker's or hearer's persuasions, beliefs, or expectations. Here he has argued that the social context as explained in sociology sheds light on how individual preferences, beliefs, norms, values, and expectations are developed and impregnated. For instance, Bourdieu's and Gidden's approach to the interdependence of structures and actions provides supplementary arguments for the economic interaction in markets.

As outlined in this chapter, information processing as a cognitive process concerning an individual's selective perceptions, different modes of learning, and understanding is also important in order to grasp information as a non-linear transformation. The disclosure of information is not to be confused with communicative interaction and language-based heuristic. As it was argued, however, this language-based heuristic is also a supplementary part of economic interaction as well. Decision-making and judgment are language-based and not to be seen as an exchange of mental states. The introduced research in cognitive science is important for macroeconomics in order to understand how meaning and understanding evolve.

The conceptual framework of communication in its dimension as an *interactive procedure* implies that neither the sender, the message, nor the receiver are assumed to be unchangeable through time. The conceptual framework basically refers to the interactive procedure, which is understood as the continuity of changes.

2.3.3 The context dimension

At this point the third dimension enters the discussion: *How* much and *why* does context matter regarding the emergence of meaning and understanding? As I indicated above, the learning process and behaviour

of a person are not determined by the release of information, since the individual actively attempts to adapt, understand, and perceive information through an acquired knowledge base. Of course, if certain information were given by a person or an institution such as, for instance, the information 'fire', we could rightly assume that any person would try to escape the situation immediately. The information 'fire' in the process of understanding is, like other information, dependent on the context – but only in stages. The three stages above – understanding as linked to the acquired knowledge, judgment, and way of acting – would have together been taken into account in that moment of escape. The word 'fire' is independent of any situation understandable as a symbol for danger and no rationally acting person would unnecessarily stay in a dangerous situation. However, significantly different reactions by people could be imagined by using the word 'hurricane' because in some regions the event 'hurricane' is barely imaginable, while in other regions the word 'hurricane' would be understood as analogous to 'fire'.

According to monetary policy, the word 'interest rate rise' is also understood regarding the different contexts and agents with their preferences and motives. The context can be described as the environment or surroundings in which both the speaker and hearer, or group of agents, institutions, or organizations, act and configure or shape the communicative interaction. Here again we confess that the communicative interaction is not purely discussed in isolation from the context. Although it could be conceivable that if the meaning of a word, for instance 'fire', were independent of any context, the responses of people to this word would be diverse. Of course, comparable patterns of responses and reactions by different agents can be imagined.

Regarding this third dimension of the conceptual framework approach to communicative interaction, the context, we must acknowledge that the context (as such) does not cause the behaviour of people, but their interaction, responses, and (re)actions within the context. In doing or acting, people will also create new contexts. Their interactions will shape or change situations.

This 'contextualization' of the meaning should not be confused with socio-linguistic approaches. Contextualization means to recognize the surroundings of a speaker's and hearer's communicative interactions (Auer and Di Luzio 1992). This view also provokes questions such as the following: How can a context be described? Where can we draw the border of a context? These attempts to define a context always necessitate redefining it by creating another context. It is not possible to define

the context itself by reference to exact borderlines unless one creates a further illusion, for instance, defining a context by artificial rules.

We approach the concept of context to describe human actions as a web of the mixed variety of human behaviour or actions. A context is not dice or something tangible. Describing a context requires separating all human actions that are embedded in this context – with the result that we are not able to describe the context anymore. A context is like a web whose patterns are incomplete and varied in different ways. But *how* we describe the woven pattern depends on our perception and acquired knowledge and, therefore, on how we perceive the web selectively (Thomas 1995).

How can we know that we are part of a context? For instance, Greenspan elucidated that the problem of identifying a bubble economy is rooted in the problem of how to identify whether one is in the bubble. We communicate, we act, we discuss, we perceive within a context, but we do not measure in which context we behave and act. We act within a certain space and time, but this is not identical with acting in a context. The context emerges from people's way of acting. Of course, the information given during the open hours of the stock market identify space and time and, hence, the context. But the problem of identifying where the context of the stock market begins and ends still remains. The context is neither given by the location of the stock market, nor by its time of operation.

No exact definition of context is found in the literature (Kober 2002). There are, of course, good reasons for that. Whereas Habermas used the concept 'lifeworld', Wittgenstein used the concept 'world picture'. According to Wittgenstein, the world picture provides a background for decision-making and judgment. 'Above all it is the substratum of all my enquiring and asserting' (Wittgenstein 1979 § 162). We cannot change our world picture, that is, our context, like we get out of or into a car. We cannot jump out of our world picture. We are part of the world picture or context, which is like a web. A world picture is a web of a variety of persuasions or convictions. We share, *or* we do not share, that web of persuasions, beliefs, and convictions with other people. If we try to identify these persuasions by classifying them into different categories, such as α, β, χ, then we approach a web of persuasions using different categories. If we are successful in identifying all kinds of persuasions, and if we have labeled them with our categories, we will nevertheless approach a web of categories, not a context. Hence, we will not achieve a definition of the context we are part of. We could define this web of categories as, for instance, 'C'; this letter will label only a part, however. To name elements is not identical with describing it, and instead is just

the preparation for a description. A word gets its meaning, not by naming, but in the sentence, in the context. 'Naming is so far not a move in the language-game – any more than putting a piece in its place on the board is a move in the chess' (Wittgenstein 1978 § 49).

Davidson emphasized that language must incorporate or depend upon a largely shared view of how things are, that is, a context or web of persuasions.

> Communication proves the existence of a shared, and largely true, view of the world. But what led us to demand the common view was the recognition that sentences held true – the linguistic representatives of belief – determine the meaning of the words they contain. Thus the common view shapes the shared language. (1984/1977, 199–214: 201)

Davidson admitted that he is not the first author who emphasized that shared beliefs are required for success in communication interactions, since there were other authors who worked out this view, for instance, Kant, Humboldt, Wittgenstein, and Frege. Of course, there is no doubt that speaking or communicative interaction always occurs in situations or contexts. What seems to be disappointing here, because of the vagueness of the concept of context, should nevertheless provide more clarity. Regarding the use of everyday language, vagueness does not exclude clarity. As I tried to outline in the paragraph above, we are part of the context or world picture. Although the concept 'context' or 'world picture' remains vague, it is understandable in 'normal circumstances' (Wittgenstein 1979, § 24). We are always part of a context and cannot separate ourselves from it. 'There is no cosmic exile', as Quine wrote (1959, 275).

A discussion about the exact borderline of a context will only arise in those cases in which we are not successful in aiming for a common understanding. It is similar to the notion of misunderstanding (Dascal and Cuycken 1988; Dascal 2007). Only in the case we feel misunderstood are we able to outline approximately what is missing or wrong. But when we feel understood we cannot exactly say *why*. Moreover, it is not necessary to explain or to investigate *why* we feel understood or *why* we understand because *we do understand*. That suffices. For success of communication in the context, it is important to share beliefs and to refer to the 'average opinion', that is, to perceive the interdependencies. According to Habermas, the agents are rational, that is, agents aim for a common understanding, and this implies a coordinative interaction. Aiming via coordinative interactions also provides a

common view of the context world-view. After having outlined some considerations on this point it should be clear: we cannot define a context the way we define a car or the world market. Wittgenstein summarized this:

> 'So you are saying that human agreement decides what is true and what is false?' – It is that human beings say what is true and false; and they agree in the language they use. That is not agreement in opinions but in form of life. (Wittgenstein 1978 §241)

What seems to be a triviality has often been neglected in economic science. Economic interaction as language-based interaction is different from economic modelling. The context of a model is constructed as a deductive means of conclusion and, therefore, it has strict borderlines, composed of exact words, premises and, hence, conclusions. The method of deductive solution of modelling itself defines the context and the content of the chosen model. In contrast to the term context as it was used in our previous considerations, the context of a model is non-ambiguous, non-vague, and stable.

If we assume that we consider and judge the real world by applying deductive logic and methods to it, this lacks conviction. Deductive logic is based on universal and mechanic controlled formal language constructions ('*Convention-T*'). Axioms and deductive rules of reasoning and calculating are used to describe a deductive construction, but they are not representatives for scientific as such. Scientific methods are not restricted to one single method, that is, deductive reasoning.

Acting means that agents shape the context, that is, meta-model views, and also create new contexts by their modes of action based on language activities or communication. An important implication regarding the context or situation is first and foremost that any communicative interactions require the use of language as a public medium, since private language could neither be used to shape situations and contexts, nor create a new one (Capella 1987). Therefore new contributions in the language and cognitive sciences emphasize the interpersonal, organizational, and public sphere of communication in contexts (Noteboom 2007; Muchlinski 2006; Trabant 2008) which are also relevant to economics as social science.

2.3.4 Reflexive communication

Non-classical models of communication are defined as reflexive models of communication (Antos 1999, 102). The term reflexivity focuses on

communicative interactions. Reflexive models of communication initiate and create another space of perception and effectiveness. A reflexive model of communication vigorously defends the non-linearity and the non-causality of communicative interactions. Any given pattern of this non-linearity is an infinite process of reciprocal perceptions which also create a space of mutual recognition. The reflexive model is focused on the mutual recognition space and, therefore, on the context of the communicative interactions. These mutual recognitions in context are, of course, important to the process of expectation-building. The incorporation of the procedure of forming expectations also structures the space of mutual recognition. Since the theoretical upheaval in modern central bank literature occurred, central bankers have become more used to debating in terms of mutual recognition and understanding (Blinder and Krueger 2004, 327–387). However, most contributions are devoted to central bank communication as a process of delivering information by the central bank (Ehrmann and Fratzscher 2009; Gurkanak, Sack and Swanson 2005; Poole and Rasche 2003; Rasche and Thornton 2002).

I turn now to the reflexive model of communication. Reflexive models try to acknowledge the creativity of the use of language. Reflexivity and reciprocity are indicators in order to elucidate the process of understanding. In that respect, reflexive models are based on the repercussive reactions, and the associated dialogue is based on situation, context, and language in use. We could define reflexivity as a presupposition of any kind of communicative interaction. In reflexive models the effort of communication depends on reciprocal perceptions, the self-commitment towards common understanding and actions. It also draws attention to the creation of sense, that is, of the practice and surroundings of the communicative action. The reflexivity of interaction implies the need to make a commitment. Reflexive models of communication stand in contrast to the conduit metaphor, that is, to communication as a linear process and as a one-dimensional procedure.

Regarding the matter of central bank communication, it is clear that the transition of the Federal Reserve Bank towards more openness also implies a further step to self-commitment. Moreover, any dialogue between the central bank and financial markets structures and configures the space of mutual recognition and understanding. It will create further acknowledgement of economic interdependencies among the participants in communicative interactions.

We shall now move a bit further into the question of what characterizes a reflexive model of communication. Concerning the central

bank and its interaction with the financial market, a reflexive model of communication works through three particular steps, as follows (Antos 1999):

a) The central bank (A) acts; it gives information to the public and explains it, that is, the central bank communicates; agents of the financial markets (B) react and give responses;
b) A perceives B and vice versa.
c) A perceives the perception of B and vice versa.
d) In short: A (B[A]) and B (A[B]).

A knows that B will work to establish reciprocal interactive pattern. B responds to A in the established space of perception and interaction. The creation of conditions of reciprocity of perceptions of A and B also implies a web of commitment and, therefore, a new social order. Any interaction based on that reciprocity will create a new social situation which itself is dependent on the situation. The creation of the conditions of reciprocity of the perceptions of A and B – A (B [A]) and B (A [B]) – also evokes a space for forming expectations. Therefore this reciprocal conditionality provides an infinite procedure of reciprocal perceptions and inherent connection of communicative interactions. In a weak sense of the expression – for example, the face to face-situation of central bank and market – it is also possible to describe a central bank's communication with agents of financial markets as a compelling means of further development of the 'face-to-face approach'.

The refinement of internal and external communication of a central bank is a striking example (Winkler 2000). The central bank acts as an individual. This is also true for agents of the financial market because *the market* itself does not act or communicate. Therefore, the creation of conditions of reciprocity of both agents – the central bank and the agents in the financial market – configures the environment.

The conditionality of the mutual perception of A and B lead to a non-causal communication. The commitment is not rooted in a causality of interaction because language does not manifest itself in causality. Language manifests itself in meaning rooted in social interactions as described above. The social interaction with the central bank and the financial market creates social reality. This social reality encompasses the possibility of a reconstruction of the three phases as described above. It also encompasses coordination, interaction, and expectations. It makes it clear that the meaning of words depends on contexts, circumstances, and their variations. The process of building expectations of agents in

the financial market towards further development is dependent on the perceived reflexivity inasmuch as it arises out of a symmetric interaction. One important consequence is that the symmetrical development of interactions between a central bank and agents of the financial market will also lead to a self-commitment towards the other agents of communicative interactions. This self-commitment can be interpreted as a result not only of interaction, but of *reflexive* interactions and perceptions. There is no place for linearity or for the hierarchical transmission of information by a sender to a hearer.

In a reflexive model of communication, the perceived interaction evolves a system of commitment and mutual responsibility. This system can be described as a combination which is rooted in distinct preferences but composed of mutual consensus regarding the overall goals of such reflexive communication. It is more than a simple model of communicative interaction because it draws attention to the evolution of reciprocal commitment in order to shape the financial market as a social reality. The core of the reflexive model of communication lies in this. The evolved commitments by the reciprocal perceptions and communicative interactions configure the social reality.

As explained by the idea of 'face-to-face interaction', central banks' communications continuously generate new situations which the central bank itself shares – and must share – with the agents of the market. There is no escaping from that. It misses the point to argue that the central bank 'enters a situation' which has been created independently and irrespective of its own communicative actions. In contrast to the view of the classical model of communication, the reciprocal perceptions of the agents involved contribute to the situation they all share. The model of reflexive communication emphasizes the role of language, that is, it recognizes the non-neutrality of language in the evolution of social reality.

Interactive communication is an 'infinite process' of reciprocal perception. Communicative interactions and communicative patterns of actions result in and from the use of language and in routines including those of language use. Successful communicative actions will also both provide new routines and perpetuate familiar ones. Routines work as long as no failure, that is, miscommunication, disturbs communicative patterns. Miscommunication, is a vague and imprecise notion, like the notion of communication, itself, as is also true for the idea of a coded language applied to central banking.[16] At this point it is important to distinguish clearly between miscommunication and misunderstanding: In case of a misunderstanding, no agreement on the issue in

question will be possible, whereas miscommunication is inherent in all communication, according to the reflexive view of communication (Dascal and Cuyckens 1988, 219–306).

The presumption of the linearity of communication, and also the view of communication as an absolute and not relational entity, conflicts with the modern view of communication introduced by Watzlawick et al. Watzlawick, for instance, explained that communication shall be characterized by the process of reciprocity inherent in all communicative interactions. This feature of reciprocity is not present in the classical model. The aspect of reciprocity, as well as the communicative interactions, remain in the dark because they are interpreted as so-called epiphenomenon. As epiphenomenon, reciprocity and communicative actions do not, in the classical view, have any relevance for the success or effectiveness of communication. In the classical model the process of communication and of information are not acknowledged as reciprocal interactions in which the meaning of the information has, first and foremost, to be developed. In the classical model of communication, the receiver is an empty box.

Let us summarize both the classical and reflexive models of communication here: models of classical communication focus on the causality, transitivity, and measurement of information being transmitted from a sender to a receiver. A one-dimensional relationship of sender and receiver are at the centre of attention because the sender merely transfers given information and, hence, a given meaning to the receiver. In contrast to that, the reflexive model of communication emphasizes the dynamic use of language, that is, it recognizes the non-neutrality of language as an active component in the evolution of social reality. The principle of reciprocity goes beyond the sender-receiver issue because it draws attention to the situation and the context of the communicative interactions. The reciprocity approach is based on reflexivity and the unavoidable selectivity of perception, both in the recipient of a communication and, indeed, even in the sender of the message regarding its receipt and interpretation by the recipient. It focuses on non-measurable elements such as persuasion, expectations, interpretation, and action, including non-verbal responses and counter-responses. Communicative interaction is based on the understanding of language as an instrument of thought, that is, not of language as neutral vis-à-vis thoughts. Language is not the materialized content of a neuron in the biological speech centre of the brain. Language is a medium for recognizing the world and to shape, conceptualize, translate, encapsulate, and systematize experience and knowledge. Communicative interaction and

language, as Austin and Searle emphasized, are the results of different conceptualizations, but are not the equivalents of things, properties, or objects. Language and communication, as well as information, are constructions and, therefore, conceptualizations of social phenomena.

To summarize the previous paragraphs: The conceptual framework of communicative interaction is not compatible with approaches devoted to mechanical analogies and deductive reasoning. The conceptual framework I have introduced excludes theoretical views of communication such as mathematical or linear theories (Shannon and Weaver 1949), quantitative theories (Schegloff 1993), or marketing approaches. This conceptual framework is aimed at describing the interdependencies of three dimensions – information, interaction, and context – by focusing on communicative interactions. It provides a framework of reasoning for central bank interactions and communication with agents of the financial market.

3
Central Banking and Communication As a Function of Circumstance

> Central banks generally appear to have embraced a common model of the channel through which monetary policy functions, although the specifics and emphasis given to those channels vary according to our particular circumstances. All banks ease when economic conditions ease and tighten when economic conditions tighten, even if in differing degrees, regardless of whether they are guided by formal or informal inflation targets.
>
> Greenspan 2004, 39

This chapter draws attention to the reasons why central banking needed to refer to circumstances. Circumstances draw our attention to the importance of linking a view based on models to the context and circumstances. The so-called *embraced common model* in fact reflects the new wisdom of central banking, since it relies on observation and recognition of changing circumstances. There are at least two main branches wherein the term circumstance can be referred to. Circumstance can be defined with respect to the different monetary policy regimes to which a central bank is committed, and to the mandate. A commitment to a mandate also implies that a central bank acts as an institution.

Central banks are not additional factors of an already given social environment: as was explained in Section 2.1, through reference to the interdependence of social structures and acting, central banks are not simply 'implemented' by their mandate. Central banking is aiming *at reaching its mandate, that is, central banking is a process*. Consequently the communication strategy of a central bank needs to be applied to both

its monetary policy regime and its mandate. This is also true regarding its reputation and credibility. There are also warnings in the literature to keep in mind the goal of a central bank. Consider the following comment by Issing (2005a, 68):

> Any discussion on the communication and transparency of monetary policy that starts off in abstract terms and in isolation of the actual task of a central bank is bound to lead to misunderstandings. Transparency is not an end in itself: a central bank is not established with the primary objective of communicating with the public. Its mandate either stems directly from the monetary system, as was the case with the gold standard, or is specified by the legislator, which became necessary in times of the paper standard.

Issing's reference here to the monetary policy regime and the mandate of the central bank indicates the importance to a central bank's environment and its action of the reliance on communication. In the literature, particular monetary policy regimes have been differentiated and widely accepted as basic frameworks to move in for making further distinction – inflation target, monetary target, and exchange rate target, including different kinds of fixed exchange rate regimes or currency boards (Mishkin 1999). Broadly speaking, a central bank can adapt to an inflation target with or without a numeric specified goal, a monetary target, or an exchange rate target (Mishkin and Schmidt-Hebbel 2001; Shu Lin 2007; Schmidt-Hebbel and Walsh 2009). Some authors argue the monetary policy regime of the Federal Reserve functions as an implicit nominal target. Other authors object to the proposal that the Federal Reserve should adapt inflation targets (Greenspan 2002; Friedman 2004).

Regarding these roughly sketched concepts of monetary policy regimes, one has to ask what kind of consequences can be discussed regarding their communication policy. Blinder and Goodhart et al. (2001, 10) described the choices for central bank communication as being based on simple or complex rule-based monetary policy regimes as opposed to discretion. Simple rule-based regimes are, for example, currency boards and fixed exchange rates, whereas exchange rate peg and crawling peg regimes are examples of less rigid rule-based systems. Contrary to that distinction, a wide-range inflation targeting central bank is a more complex discretionary monetary policy rule. Both simple and rigid rules are supposedly driven automatically and, hence, do not need support by communication, whereas complex discretionary regimes need more communication efforts on the part of the central bank.

This linkage between the monetary policy regime and the classification of various approaches above provides an interesting picture of the place given to central bank communication literature at that time. It should be clear that Blinder and Goodhart's et al. reference to this traditional 'rule versus discretion' approach is to be understood as a first step in linking monetary policy to communication and central bank talk in order to expand upon the traditional view of central banking. This traditional distinction has been configured by the community of science and has dominated debate on monetary policy and decision-making procedure since the 1970s. The dichotomy of 'rules versus discretion' was conceptually a simplified view on the decision-making process of a central bank. This dichotomy was abstracted from context and circumstances, from historical knowledge and from the interaction of structures and actions, hence from about how rules have been developed and how it has been achieving acceptability. This concept of 'rules versus discretion' was due to a model view, constructed for the sake of formal, hence deductive, results. It conforms to formal appropriateness (Muchlinski 2003b, 2003c). Criticisms were made by Cukierman (2002), Ferguson (1999), Issing (1996), King (1997), and McCallum (1997, 1999), among others; for example, James Tobin (1983, 508) stated, 'simplicity gives them their political appeal and power'.

These criticisms, which are mainly expressed by central bankers and central bank literature, addressed the simplified approach to the central bank decision-making process as unacceptable.[1] It is clear that a model does not fit reality because the task of modelling is to evaluate different kinds of interrelations to certain well-defined premises and conclusions incorporated by the particularities of the model view. A model view is anchored to premises and conclusions. A model view encapsulates a logical progression which can be outlined according to a variety of changes regarding the parameters of the model and resulting in various logical conclusions. From my point of view, I find it important that these criticisms seem to slightly redirect economic modelling towards a model perspective which can be linked to economic circumstances and context. Although it is not possible to apply a model perspective 'to' a reality perspective, even with a so-called model projection method or rules of projections, in economics it is nevertheless the task of a model that it must appropriately explain changing patterns of behaviour in changing circumstances or a 'lifeworld'. As was argued in Chapter 2, these patterns are configured by the interdependence of structures and actions. The benefits of the use of modelling in social science are not in delivering formally designed methods of deductive reasoning addressed

to invariant or variant parameters ruled out by mechanical reflexes. Central bankers should work with models which possess explications of central banking in changing environments (see Blinder and Yellen 2001; Ehrmann and Fratzscher 2008).

The Volcker era could be reread as an example of an inadequate formal approach because the 'k-percent-rule' or 'money growth-targeting' ignores the circumstances of the institutional interactions between the central bank and commercial banks regarding the concepts of money, the innovation of fiat money, of money demand and supply in the economy. This 'k-percent-rule' and 'money growth-targeting' could not have been implemented. Earlier a comment by Goodhart (1994) and Vickers (1998) regarding the Bank of England was mentioned (see Section 1.2). I will turn to another example in this chapter, the Greenspan era.

Clarida, Gali and Gerler (2000), and Goodhart (2001b), among others, proposed improving the theoretical concept of 'rules versus discretion' by emphasizing that 'rules' also imply discretionary manoeuvres in the decision-making process of a central bank. As I will outline in Chapter 5, the concept of 'rule' applied in social science does not work as a mechanical analogy (Muchlinski 2003b, 2003c).

Bernanke (2004, 2) referred to distinct concepts he described as *simple feedback policies* and *forecast-based policies*.[2] He explicitly rejected arguing on the basis of the traditional view. He also objected to modification of it into 'instrument rules' and 'targeting rules', as proposed by Svensson (2003). Bernanke stated that he sought to explain his view on the basis of distinct concepts which do not evoke any terminological association with previous debates. Bernanke (2004, 2) made a 'gestalt-switch' towards new categories in central bank literature by arguing:

> Unfortunately, for my purpose at least, this (traditional, EM) terminology is somewhat misleading. First, the term 'rule' suggests a rigid and mechanistic policy prescription that leaves no room for discretion or judgment. ... Today most monetary economists use the term 'rule' more loosely to describe a general policy strategy, one that may include substantial scope for policymaker discretion and judgment. Here I will use the term 'policy' instead of 'rule' to avoid the connotations of the latter. Second, the terms 'instrument' and 'targeting' are products of the intellectual history of the debate and, to my mind, are not particularly descriptive. I will refer to the approaches known in the literature as instrument rules and targeting rules instead as *simple feedback policies* and *forecast-based policies*, respectively.

He emphasized that *simple feedback policy* implies a high degree of ignorance of the structure and activity in the economy. However, *simple* in this context means that agents in the market know that the central bank itself acknowledges only a few indicators and variables, which have been used to model decision-making and expectation-building according to the robustness of results in econometric tests. It is comparable with Taylor's approach to monetary policy (1993, 1999), specified in a simple and robust model.[3] It can be interpreted as a policy relating to a short time projection which is understood immediately and needs no further explications or communications.

In contrast, the *forecast-based-policy* implies a continuous procedure of economic judgments and evaluation. It is related to a mid-term projection of about six to eight quarters. Regarding the interaction between a central bank and agents in the market Bernanke (2004, 5) explained: 'Under *forecast-based approach* ... judgment or special information should affect policy choice to the extent that it affects the forecast or the risks to the forecast.' A particular feature is that the central bank opens up its transparency and communication to the judgments of experts in order to aim at an agreement on the prospective performance of the economy with the market participants. In contrast to the *simple feedback policy,* the *forecast-based policy* refers to a comprehensive set of economic variables which should be explained and communicated to the politicians and the public.

According to Bernanke (2004, 8), communication has become an elementary function in clarifying the Fed's information policy.

> As a general matter, the more guidance the central bank can provide the public about how policy is likely to evolve (or about the principles on which policy decisions will be based), the greater the chance that market participants will make appropriate inferences – ant thus the greater the probability that long-term interest rates will move in a manner consistent with the outlook and objectives of the monetary policy committee.

He emphasized that *simple feedback policy* and *forecast-based policy* are not equally used sources in the decision-making process; the *forecast-based policy* has becoming more important to most of the central banks. To sum up this pattern of judgment, the *forecast-based policy* provides an appropriate link to changing circumstances and the context of a central bank (see Bernanke 2004, 5). Although the Federal Reserve does not base its monetary policy on published forecasts, the *forecast-based*

policy indicates the importance of the interrelated structure of economic variables.

Bernanke gravitated towards new concepts in order to configure the debate on the methods of decision-making and monetary policy, steering it in a new direction. He avoided being captured in a cognitive straitjacket based on a misleading analogy arising out of traditional concepts. Recognizing both policies as sketched above, one might ask how appropriate the *simple feedback policy* is in the purpose of steering market expectations and getting the long-term interest rate to a level which is needed in order to implement the central bank's mandate. In other words, which methods are needed for 'getting the markets in synch with monetary politics'? (see Chortareas, Stasagave and Sterne 2002; Cukierman 2002; Walsh 2002). Also, communication seems to function more as a medium to transmit and explain information given by the Fed.

If we interpret *the simple feedback* policy as a code or rigidly fixed rule, then this policy should be seen as inadequate to monetary policy and its task of steering the market expectations of a heterogeneous group of agents in financial markets. However, if we instead understand it as heuristic thinking or as 'the recognition heuristic' introduced by Goldstein and Gigerenzer, it needs to be connected to the 'ecological environment' (ibid) and circumstances. The assumption underlying the effect of the *simple feedback policy* is that agents in the market are accustomed to diversifying their attention. They are inclined to pay attention to experienced 'rules of thumb' as the experiments of Goldstein and Gigerenzer documented. The agents are in the habit of focusing on information that resembles the acquired knowledge base. However, this cognitive anchoring does not imply that the agent's expectations are past driven or mental states which should be conveyed by language, but rather that they do not act as billiard balls bouncing around without history, experiences, and social circumstances.

A *simple feedback policy* can only be interpreted as a primary step in anchoring the inflation expectations, which then needs to be supplemented by the *forecast-based approach*. In my view this is of great importance to the dominant *forecast-based approach* to monetary policy and the forward-looking behaviour of the agents.

The crucial aspect of market interactions is that the private sector has to estimate the future level of prices and short-term and long-term interest rates in money markets given the historical path of their movements and the dependency of the path of the central bank's decision-making process. The forecasting models of the private sector encompass

coefficients concerning macroeconomic variables which need to be constantly reassessed (Orphanides and Williams 2005). According to the current controversies in the literature, it has been argued that market expectations need to be anchored in a commitment by the central bank (Woodford 2005; Orphanides and Williams 2005). It is not the given level of short-term interest rates that is important, but the expectations of the markets participants regarding the long-term interest rates and, hence, the future level of the short-term rates.

However, does a credible commitment – a 'sound policy' – by the central bank regarding its future path of inflation allow the private agents to stabilize their expectations? Would it minimize the uncertainty in the markets? There is no consensus in the literature on this matter (Greenspan 2002, 2004; Blinder and Reis 2005; Kohn and Sack 2003; Issing 2008). As Bernanke explained, actions and interactions in the financial markets are also driven by expectations which are impregnated by the history of the concepts and categories. The crucial point is that any kind of commitment by a central bank on the future path of price development and interest rate levels needs to be anchored in changing circumstances and contexts in order to be understood as 'a sound policy'. As has been stated, communicative interaction is not a linear process, and information is not 'given' by the sender, but rather through information processing based on the possibility of understanding.

The demand for a commitment is rooted in the abandonment of the traditional view because of its inadequacy in central banking practice. Given the traditional model view composed on the rational expectations hypothesis (REH), no stabilization is needed because the hypothesis works as a stabilizing parameter of the model itself. Based on the 'common knowledge' assumption, the REH implies perfect information, perfect knowledge, and perfect understanding. The demand to stabilize inflation expectations via a central bank's commitment seems to have the function of substituting the model premise of REH with another. However, given this model view, no differing result will be possible. The claim that agents in the market need a central bank's commitment is not convincing because it does not guarantee better understanding, since it is further information which has to be perceived regarding changing circumstances. More information does not automatically lead to a better understanding. A commitment by the central bank could lead to a test by the market in order to prove whether this commitment is credible or not.

At this point the *forecast-based policy* as explained by Bernanke indicates that the Federal Reserve should try to improve the communicative

interaction with the markets. I subscribe to the view that it is necessary to focus on the understanding. In the case of the Federal Reserve Bank there has been a strong demand on the agenda to specify its mandate of 'price stability' as a numerical goal in order to concretize context and circumstances. It was argued that the Fed follows a 'Just-Do-It-Strategy' because it has not yet adapted inflation targeting. The monetary policy regime was then described as 'Inflation-Targeting with an implicit nominal anchor' (Mishkin 1999; Goodfriend 2005), whereas Greenspan (2002) and Kohn (2005b) objected to the demand and also to the above description.

One consequence of the above debate is that the communication skills and efforts of the Federal Reserve Bank needed to be improved – a goal Chairman Greenspan had exercised intensively. I will turn to it shortly. However, Bernanke (2004a) made the point that *times are changing* and the postulate 'never explain, never excuse' does not fit the modern view of central banking.[4] Greenspan (2004, 37) introduced the *forecast-based policy* as the new 'risk-management approach to monetary policy', as an approach to problem solving and as an alternative in optimizing a strategy that, 'emphasizes understanding as much as possible the many resources of risk and uncertainty that policymakers face, quantifying those risks when possible, and assessing the costs associated with each of the risks.'

Greenspan described his work at the Federal Reserve as an 'epistemology', as a science of identifying what is known or unknown or known and unknown for whatever reasons. A remarkable feature of his speeches, for example, is that they were concerned with a broad range of topics describing that landscape.

The 'risk-management approach to monetary policy' was summarized and concretized by Blinder and Reis (2005). The 'risk-management approach to monetary policy' explicitly moves beyond the pure model view on central banking by integrating different risk categories (macroeconomics and microeconomics), different levels of risk (moderate, high, low), and descriptions about the management quality (strong plus lag, weak plus lag, or acceptable lag).

It is based on key considerations that monetary policy should act by gradual degrees and avoid abrupt activity. To be more precise, the 'risk-management approach' is composed of key principles – such as a) 'fine tuning', for example, 'conservatism' regarding the fundamental uncertainty surrounding central banking; b) 'interest rate smoothing'; c) 'reversal aversion'; and d) 'preemptive decisions' – in order to acknowledge changes in the structures and to be able to implement actions right on time.

The principles of 'fine tuning' and 'interest rate smoothing' are to be seen as steps towards soft changes in the level of the nominal short-interest rate according to the specific asymmetry of times which affects long-term interest rates and inflation expectations. Greenspan emphasized that the Federal Reserve should act conservatively and not move suddenly or impulsively to change the direction of the market expectations. What does uncertainty mean? Greenspan (2004, 36–37) clarified this:

> The term uncertainty is meant here to encompass both 'Knightian uncertainty', in which the probability distribution of outcomes is unknown, and 'risk', in which uncertainty of outcomes is delimited by a known probability distribution. In practice, one is never quite sure what type of uncertainty one is dealing with in real time, and it may be best to think of a continuum ranging from well-defined risks to the truly unknown.

The Federal Reserve was tightening nominal interest step by step. However, as the experience of the Federal Reserve in the 1990s showed, inflation contributed to the price bubble. This occurrence cannot be explained by the adequacy of the Taylor rule, but rather by further attempts to understand the changing environment (see McCallum 2000, 2000a). At the time of making a particular decision, however, changes in the environment may not be perceivable as a hard fact, as an index, or as a number.

The principles of 'reversal aversion' and 'preemptive decisions' are identified as being a way of acting soundly to acknowledge changes of structure. For a central bank, changes of nominal interest rates are always important signals to the market. This is also true if a central bank announces a correction of its interest rate decisions once it has made a decision publicly. A spontaneous correction will affect its reputation and credibility regarding further decisions. However, no central bank wants to be accused of being 'behind the curve'. Greenspan does not offer a 'magic formula' but he offers certain considerations regarding the 'risk-management approach' described above. Blinder and Reis (2005, 82–86) concluded as follows:

1) 'Keep your eyes open'. Monetary policy does not work as a rigidly fixed rule. Step beyond old fashioned concepts like 'rules versus discretion'.
2) 'Don't let yourself get caught in an intellectual straitjacket'. There exist many concepts in macroeconomics like NAIRU,

REH, PHILLIPS-Curve, which have been playing a role as selective approaches to economic optimization rather than economic circumstances and problem solving.

3) 'Avoid policy reversal'. Economic procedures are not linear procedures and almost none have reversible traits.
4) 'Forecasts, though necessary, are unreliable'. Forecasts need to be linked to the contemporary world.
5) 'Formal optimization procedures work in theory, but risk management works better in practice – especially as a safeguard against very adverse outcomes'. Acting in practice and circumstances is preferable to optimization.
6) 'Recessions are bad, as is growth below potential'. The Federal Reserve's 'Dual Mandate' is an adequate response to ups and downs in the economy.
7) 'Most oil shocks should not cause recessions'. A modification of the definition of inflation or core-inflation will show a way out of recession.
8) 'Don't try to burst bubbles; mop up after'. Greenspan argued in favor of a 'mop up after' strategy because a central bank's mandate is price stability and not intervention in the procedures of the markets. Additionally it should be acknowledged that a central bank cannot have a pretense of clarity about the limits of a bubble.
9) 'The short term real interest rate, relative to its neutral value, is a viable and sensible indicator of the stance of monetary policy'. Although the Federal Reserve sets the nominal interest rate, the Federal Reserve funds rate, it nevertheless aims for a certain level of the real rate.
10) Blinder and Reis (2005) demanded a transformation of the dictum of Teddy Roosevelt, who stated, 'talk softly, but carry a big stick', into 'talk modestly, but set your sights high' (ibid).

The above summary also underlines the notion that the Greenspan era has influenced the theoretical debates on central banking.

My own thoughts on this are that the importance of the circumstances and context regarding the evolution of the meaning and understanding can no longer be neglected, because it keeps the central bank fulfilling its mandate and ensuring the effectiveness of monetary policy. This can be shown by reference to Greenspan. In the literature the 'Greenspan era' is described as a successful one, although it cannot be described as a 'Greenspan rule' or 'Greenspan model' (Blinder and Reis

2005). However, the label 'Greenspan model' misses the point regarding his way of acting and communicating (Sicilia and Cruikshank 2000). Nevertheless, the absence of any particular rule or method was essential to his success. Greenspan's announcements show, in my view, that he avoided use of a coded language while interacting with the markets.

Greenspan described the context in which the central bank is embedded by referring to three particular features:

a) The political acceptability of price stability a central bank is aiming for. The background of this acceptability is without a doubt rooted in the negative consequences of the monetarist experiment regarding the tight money policy and depression around the globe.
b) The challenges of the globalization process which definitely changes the competitiveness in global financial markets.
c) The new technologies which set high and completely new standards for the traditional concept underlying the monetary policy, for instance, the price index.

Any judgment about monetary policy is also connected with the context and circumstances:

> We were fortunate ... to have worked in a particularly favorable structural and political environment. But we trust that monetary policy has meaningfully contributed to the impressive performance of our economy in recent decades. (Greenspan 2004, 40)

The decision-making procedure of the Federal Reserve is framed by different models, rules, and models of forecasts which have to link to the context and environment. The judgment about changing phenomena in the context requires first of all the willingness to notice changing aspects of that landscape. Secondly, it requires one to revaluate and reinterpret the observations, concepts, and instruments by inductive reasoning. Evaluations of uncertainty and changing circumstances are not possible through reliance on deductive reasoning, since in deductive reasoning there is no uncertainty allowed for at all. Deductive reasoning draws its conclusions from premises and axioms, that is, a model. The necessity of judgment in light of uncertainty (or as Greenspan specified in a reference to Knight, when one is confronted with different or unknown types of uncertainty) means needing to step beyond the certainty of the deductive reasoning of the model world. Another consideration should be recognized: deductive reasoning implies truth or rightness in a logical

form based on logical language and syntax. Additionally, reliance upon a numerical target of price stability would not reduce the uncertainty. Uncertainty of the concrete situation and the unknown future frame the decision-making procedure in the concrete situation:

> Even monetary policy rules that use recent economic outcomes or money supply growth rates presuppose that the underlying historical structure from which the rules are derived will remain unchanged in the future. But such a forecast is as uncertain as any. (Greenspan 2000, 2)

Therefore central banking is inevitably concerned with the requirement to act regardless of the uncertain situation. There is no way to escape it, but it is possible to step beyond the supposed certainty of deductive reasoning:

> We must confront the fact that only a limited number of risks can be quantified with any confidence. And even these risks are generally quantifiable only if we accept the assumption that the future will, at least in some important respects, resemble the past. (Greenspan 2004, 38)

Keynes (1921) would have supported Greenspan's view:

> I have argued that only in a strictly limited class of cases are degrees of probability numerically measurable. It follows from this that the mathematical expectations of goods or advantages are not always numerically measurable. ... If, therefore, the question of right action is under all circumstances a determinate problem, it must be in virtue of an intuitive judgment directed to the situation as a whole, and not in virtue of an arithmetical deduction derived from a series of separate judgments directed to the individual alternatives each treated in isolation. (Keynes, *Collected Writings* Vol. VIII, 345)

By referring to the bubble phenomenon in the 1990s, Greenspan described that at every stage the Federal Reserve was faced with perceptions, facts, and events which none of the members of the Federal Reserve had previously encountered, and which could not be explained by any of the prevailing models, concepts, or categories.

The uncertainty which surrounds central bank action and decision-making process are persistent, and exist at all times. For instance, the

Federal Reserve cannot fulfil its mandate by referring to a price index only. The numerical concept of price stability does not encapsulate the evidence of moving prices throughout all branches of the economy and times. Therefore, one has to ask: what generates a stable price index? The answer is still open to debate. Greenspan (2002, 5-6) argued:

> By price stability, however, I do not refer to a single number as measured by a particular price index. In fact, it has become increasingly difficult to pin down the notion of what constitutes a stable general price level.

That technology-driven price movement requires changing the instruments and modes of perception as well as the concepts to describe new phenomena. The economy is not a mass of invariant entities which are calculable separately and, hence, measurable. The price movements of the so-called traditional industries are calculable numbers. This could not be said regarding the definition of the prices of new technologies in medicine or computer technology. Uncertainty, as the defining characteristic of the central bank landscape, also encompasses these conceptual uncertainties and, hence, problems of measurement:

> But in our new century, the simple notion of price has turned decidedly ambiguous. What is the price of a unit of software or a legal opinion? How does one evaluate change in the price of a cataract operation over a ten-year period when the nature of the procedure and its impact on the patient has changed so radically? Indeed, how will we measure inflation, and the associated financial and real implications, in the twenty-first century when our data – using current techniques – could become increasingly less adequate for tracing price trends over time? (ibid)

At this point, Greenspan repeated his objection to implementing a numerically specified inflation target for the Federal Reserve:

> For all these conceptual uncertainties and measurement problems, a specific numerical inflation target would represent an unhelpful and false precision. (Greenspan 2002, 6)

Bernanke argued that a specification of an explicit monetary policy rule would not fit changing circumstances. 'The problem is that the number of contingencies to which policy might respond is effectively

infinite (and indeed, many are unforeseeable)' (2004, 6). In his speech 'Fedspeak', he drew attention to further empirical findings which have emphasized that central bank statements matter to its policy effectiveness. Communication enlightens and explains the way a central bank works and allows the public to effectively share. Remarkably and evidently, communication has also improved the long-horizon forecasting ability of monetary policy decisions by the private sector. Bernanke (2004, 6) stated:

> With respect to actions, the central bank should behave in as systematic and as understandable a way as possible, given the macroeconomic and financial environment. That is, although monetary policy cannot be made by a mechanical rule, policy can and should behave 'rule-like' features. ... However, because the world is complex and ever changing, policy actions alone, without explanation, will never be enough to provide the public with the information it needs to predict policy actions. Words are also necessary.

According to the above citation, 'words' seem to have the role of enlightening the meaning embodied in the information given from the central bank (sender) to the public (listener). However, whereas Bernanke voted for a 'rule like' monetary policy which put the central bank itself into a certain direction of future policy and, therefore, commitment, Greenspan modified the function of a rule-like policy by stating that the meaning and understanding is not achievable by deductive arguments only. Greenspan has also written,

> I believe we at the Federal Reserve, to our credit, did gradually come to recognize the structural economic changes that we were living through and accordingly altered our understanding of the key parameters of the economic system and our policy stance. The central banks of other industrialized countries have grappled with many of the same issues. (Greenspan 2004, 33)

The perception of changing times, that is, of changing observations – and changing key parameters of the economic system – and the endeavour to improve concepts, methods and instruments provide the basis for understanding and meaning. Meaning and understanding are rooted in the use of language, in practice. Greenspan did not use a coded language. A coded language cannot be used in the context of changing practice. A coded language may be suitable to drive a car or to

the use of a machine. The communicative interaction, that is, the use of language, is embedded in the circumstances, context, and history. The meaning of a sentence is encapsulated in the historical situation and cannot evolve isolated from the context which is, of course*, a changing one*. Changing circumstances and contexts as well as changing times need to improve the understanding of the context and language and expressions used. Any language-game is a result of a common course of action. This common course of action provides 'the system of reference by means' for the communicative interaction as words need to be anchored in their context (Wittgenstein 1978 § 206).

A central bank possesses a huge amount of experience, knowledge, and capability to act, to shape, and to influence the social context the central bank is also part of. A central bank's motivation to act, shape, and influence its environment and context is primarily due to its mandate. However, the central bank's path to fulfilling its mandate is a never ending learning process. At this point the reliance upon a coded language would enhance the uncertainty for reasons I am going to state more precisely in Chapter 5. The role of learning in central bank experience has been emphasized by Greenspan (2002, 2):

> Although we have learned much about managing the financial backdrop to accelerating economic activity, it is essential that we not be deluded into believing that we have somehow discovered the Rosetta stone of monetary policy. A failure by policymakers to sufficiently appreciate the inevitable uncertainties that they confront could result in unfortunate consequences for the economy. While we central bankers do not have full knowledge, we have continued to gain insight – albeit slowly – into how market economies function. That learning process has been aided, especially in the United States, by a vast panoply of data and information from both public and private sources. However imprecise, these readings on the economy have helped us steer monetary policy through an inevitable uncertain future.

Greenspan (ibid) emphasized that the move on this road is not a lonely walk on an island, but an interactive procedure.

> In practice, it is the joining of ideas and data that drives policy in the face of uncertainty. We seek to array the probabilities of future policy outcomes, attempt to gauge the costs of being wrong in our decisions, and endeavor to choose the policy paths that appear to offer greater benefits and fewer risks.

Regarding the uncertainty surrounding the central bank's actions and decisions, Greenspan and the FOMC chose a discretionary policy because it is not possible to define economic parameters as precisely as would be needed to guide a rule-based monetary policy. Reference can be made again here to the classification by Blinder and Goodhart et al. (2001) introduced at the beginning of this chapter. The example of the so-called monetarist experiment throws a clear light upon that problem. The effect of uncertainty surrounding the central bank's practice is described by Greenspan (2001b) as follows:

> Faced with this inevitable uncertainty, a central bank's vigilance against inflation is more than a monetary policy cliché, it is, of course, the way we fulfill our ultimate mandate to promote maximum sustainable growth. ... Monetary policy, as we currently practice it, endeavours to lean the propensities for economic overshooting, from whatever source, by changing interest rate. But we are unlikely ever to be entirely successful. For example, it is not possible to foresee how far risk premiums will fall or when that decline will adversely alter psychology.

Therefore, the changing environments in which the central bank is embedded also implies the requirement of changing responses and strategic actions:

> With the virtually unprecedented surge in innovation that we have experienced over the most recent half decade, many of the economic relationships embodied in past models no longer project outcomes that mirror the newer realities. (ibid)

Although the economic commentator, Forbes, has asserted that Greenspan has guided the financial markets by 'his Delphic, ambiguous, often impenetrable prose' (*The Wall Street Journal*, February 1, 2006), I would rather interpret it as a way of acting or of communicative interaction. Greenspan described or reported on the decisions, the inclinations, and views of the Federal Reserve Bank through the use of everyday language, that is, the language in context. He avoided the pretension accompanied by the use of a coded language and, hence, the deceptive appearance of acting in a realm of certainty. He guided the communicative interactions, that is, the expectation-building process among the agents in the financial market by use of everyday language.

In Chapter 1 it was shown that the traditional assumption about central banks neglects matters which are in fact important for the

fulfilment of their mandate. Not just the concept of credibility, but also the concept of transparency, are based on economic interaction and linguistic communicative actions. Both refer to the mode of action, that is, 'matching deeds to words'. There is no hidden agenda which allows an independent central bank to implement the effectiveness of monetary policy as if driving on a one-way-road (Freedman 2003). The central bank being located and constituted within social structures acts as an institution in the social world and not the physical world. Therefore, its verbal and non-verbal interactions are not based on natural laws or rules, but on the continued evolution of compositional rules concerning the construction of utterances, institutional arrangements, actions and facts. Acting within a societal framework also implies reactions and responses. It is important to emphasize that central banks contribute to the structures of the societies of which they are part. The credibility of the Federal Reserve has been gained by the employment of flexible responses in accordance with changing contexts and changing perceptions of the economy as a whole. The concepts of monetary policy-derived actions referring to mechanical procedures of adaptation should in that sense be relegated to the past.

I now turn to a basic investigation carried out by Kohn and Sack (2003) which provides a *striking* example of how a central bank's communication interaction with the financial market has been considered. This was pioneering work on the Federal Reserve Bank's communicative interaction. Many other comparable studies have followed since.[5] Valuable research on the measurement of the European Central Bank's communication has also been carried out, but will not be presented here. Research in the literature on central banking has been beginning to measure the effects of communication in the financial markets. Ehrmann and Fratzscher provided the pioneering work and the communication strategies of both the European Central Bank and the Federal Reserve Bank. Their empirical findings support the view that communication is *the heart of central bank transparency and accountability*.[6]

Empirical investigations document that the speeches, testimonies, and FOMC meetings matter (Kohn and Sack 2003). However, private information is a certain factor in how the Fed's announcement affects the markets (Morris and Shin 2002). Nevertheless, it has been emphasized that

> the nature of the information being transmitted remains unclear. A communication about the information that relates to the insights of future policy decisions or the state of the economy – is distinguished

> form a communication that serves to coordinate the actions of private agents operating with imperfect public common knowledge. (Chirinko and Curran 2006)

The problem of central bank communication is first at all to measure how markets incorporate information. If a central bank's statements, or 'talk', do have any effect on the expectation-building process, this can only be estimated empirically.

Kohn and Sack (2003, 2) expressed the issue as follows:

> This work is a first step in a research program to provide central banks with useful evidence on what kinds of 'talk' are most successful for realizing the potential benefits of transparency. ... Lastly, our results speak to the issue of whether central banks can 'talk down' (or 'talk up') particular asset prices that they feel may be incorrectly valued.

Since limited knowledge and uncertainty surround every decision, it is hardly possible to answer the question of how, when, and in which manner statements of the FOMC, and testimonies and speeches of the chair of the Federal Reserve, have the function and effect of shaping the expectations of private agents. Current empirical studies shed light on these questions (Bernanke, Reinhart and Sack 2004; Kohn 2005).

Kohn and Sachs (2003) investigated *how* and *if* statements by the Federal Reserve Open Market Committee, as well as testimonies and speeches by the chairman, are able to significantly affect economic variables. Their claim is that only empirical investigation can provide an answer to this question. Based on a contribution by Freedman (2002), the authors differentiate three types of communication: a) the FOMC statements (so-called 'risk bias' or 'balance of risk assessment') which are released to the public immediately after the meeting of the FOMC, b) the testimony by Chairman Greenspan, and c) the speeches by the chairman. They then try to measure the effects of these three types of communication on the transparency of the Federal Reserve and the public's understanding.

The underlying questions are: Is there a link between the 'new language' strategy the FOMC started in January 2000 and the effectiveness of monetary policy? Are there significant effects on the movements of the short-term or long-term interest rates? Have these three types of communication been improving the transparency of the Federal Reserve? Is there any remarkable effect to be mentioned

regarding the aim of the Federal Reserve sharing the expectations of market participants? Does central bank talk matter at all? Economic variables, particularly the Treasury forward rate and interest rates, are driven more by words than by deeds: 'In this regard, statements appear to be an important component of the policy implemented by the FOMC' (Kohn and Sack 2003, 11).

The testimonies of the chairman to Congress have a still greater effect on the economic variables in question, that is, 'Federal Reserve funds rate, Eurodollar future rates, the two-year Treasury yield, and Treasury forward rates' (ibid, 2003, 12). The authors argue that the FOMC statements often contain the same information, but its disclosure does not lead to such a significant effect on the near-term interest rates as does the chairman's testimony.

What is the difference between these two types of communication? Before addressing this question, let us first move on to the third type of communication. Compared to the FOMC statements and the testimony of the chairman, the third type of communication, the speeches of the chairman, evidently do not have a remarkable effect on the movements of economic variables at all. The reasons are presumably to be found in the broad range of topics regularly discussed by the chairman. The speeches of Greenspan dealt with many issues, including those which are not concerned in a narrow sense with monetary policy strategy.[7] Nevertheless, it is reasonable to suppose that the effects of these speeches are embedded in the Federal Reserve's function of providing a pattern of prospective roots for monetary policy strategy – a prospective view which is important to the expectations of market participants. Although the authors deny any systematic link between the speeches of Greenspan and the reactions of market variables – that is, changes in the decisions and reactions of market participants resulting from his speeches – they do not argue that the speeches are without any relevance. The empirical evidence shows they are less significant to the market variables than are the two other types of communication. Kohn and Sachs (2003, 11) stated:

> Judging from the effects of his testimonies, we believe that speeches that address the current or prospective economic environment are likely to generate a significant market response. Our approach probably includes enough instances in which he did not address those topics to obscure the effects of speeches that did.

Regarding these three types of communication, central bank communication does matter, but why? Kohn and Sachs emphasize the

important role of expectations for economic development. A central bank cannot be successful by trying to avoid having an influence or fooling market agents or market expectations. Without doubt, the market has an interest in listening to the views of the chairman. A lack of transparency would impede the effectiveness of monetary policy and restrict its ability to fight monetary shocks.

However, I briefly turn now to central banks as institutions just in order to add the considerations above. There is no space and time to get into the details of the literature and research on monetary institutions and path-dependency of institutions or organizational path dependence (see Sydow, Schreyögg and Koch 2009). Central banks do not communicate as individuals to the market regardless of whether the chairman speaks in a press conference; they communicate as institutions. The central bank's need to focus on special information and to investigate certain economic developments – that is, the monetary transmission process which differs greatly between countries, or prices of goods markets, currencies, the rate of economic growth, and so forth – and furthermore to create and communicate certain data according to an economic environment, describes clearly its role as a monetary institution. As monetary institutions, they have comparable monetary strategies in order to secure the effectiveness of monetary policy. Institutions – their rules, structures, services – are institutional facts. Institutional facts are not 'brute facts' (Anscombe 1958). As social phenomena they are not independent of the perception, acknowledgement, and utility of the people involved. In light of the social science paradigm, social phenomena or institutional facts are created facts; they are based on language activity (Brandom 2006). One certain feature of institutional facts – like a central bank or a university – is that 'they are placeholder for pattern of activity'. They earn their acceptability by their ongoing activity. A certain characteristic of institutional facts is that they are not worn out or exhausted by its continuity:

> At this point, I am just calling attention to a peculiar logical feature that distinguishes social concepts from such natural concepts as 'mountain' or 'molecule'. Something can be a mountain even if no one believes it is a mountain. ... But for social facts, the attitude that we take toward the phenomenon is partly constitutive of the phenomenon. (Searle 1995, 34)

'Why and how does the use of language create social facts or institutions?' The answer was given by Searle when he stated that performative

acts play a particular role in the creation of institutional facts because they refer a certain status to an utterance. For instance, if I, as a private individual, say, 'the interest rate will be unchanged', this statement creates a different (presumably no) response than would be the case if the chairman of the Federal Reserve had uttered that sentence. Saying something counts as if one is entering into a contract or commitment (for instance marriage or other agreement or undertaking) – but exactly what depends on the circumstances, social functions, and position or role. For instance, the sentence 'X counts as Y' uttered in a particular circumstance or environment would (or at least could) have a different result from that in another.

Institutional facts can be created by performative acts – or speech acts – when the status-function (Y) can be imposed by declaring it to be imposed – for instance where the term X is itself a speech act. Not all institutional facts are created by speech acts. However economic facts are not like objects – stones, cars, trees – instead, economic science uses language activity to create and shape economic environments. For instance, 'the word money functions as a placeholder for the linguistic articulation for all these practices' (Searle 1995, 52–53). We do not need money to define 'money' because we can refer to different institutional facts, like buying, selling, owing, and so forth. We do not need the word 'money' as long as it is embedded in practices. Similarly, we do not need the word 'language' to define language. Searle (1995, 60) stated:

> If institutional facts require language and language is itself an institution, then it seems language must require language, and we have either infinite regress or circularity.

But such a circularity or infinite regress will not be the case regarding those concepts which are embedded in social practice. Searle (1995, 52–53) concluded:

> We avoided the vicious circularity only by expanding the circle by including other institutional concepts. We are not trying to reduce the concept 'money' to noninstitutional concepts.

To sum up this point with Searle (1995, 57):

> Since the function is imposed on a phenomenon that does not perform that function solely in virtue of its physical construction, but

> in terms of the continued collective intentionality of the users, each use of the institution is a renewed expression of the commitment of the users to the institution. Individual dollar bills wear out. But the institution of paper currency is reinforced by its continual use.

Other findings in the literature also emphasize the structure and political circumstances as favourable or as impediments for a central bank's work. However, the empirical findings have documented that the effects are very different in different countries, and the horizon of interest rate movements in different money markets – regardless of a central bank's monetary policy – is based on an explicit inflation target or monetary target. A seminar organized by the IMF invited speakers from the Asian Region, India, and Latin America to discuss the importance of the central bank communication modes and methods (Enoch 2006, Lambert 2006, Reddy 2006).

The debates over the need for a disclosure policy outline the problems regarding the status and democratic surroundings of a central bank. For instance, the structure of the financial sector in emerging countries is often too sensitive to be discussed in the same way as in the established industrialized countries (Rozkrut, Rybinski, Sztaba and Szwaja 2007). The demand for transparency and communication needs to be treated in a different manner, as the documentation by the Bank of International Settlements clarifies (Simmons 2006). This is partly due to the existing exchange rate targets and partly due to the varied economic and political environment of the central bank in different countries (Burkhard and Fischer 2009; Chiu 2003; Fratzscher 2009).

At this point I would like to summarize this chapter with some further considerations: Concepts and meaning are not givens. The history of the meaning of concepts – like 'rules' in the history of central banking and monetary policy – is the history of the procedure of creating the sense of a 'rule'. The history of concepts inevitably implies the history of the construction of the meaning of concepts. Trying to explain any historical sense and meaning leads to the requirement of explaining the language-based construction of knowledge in and of a society.

No central bank can have knowledge about the decisions and reaction of market participants *ex ante*. Nevertheless it does not start at point zero. It anticipates the perception of market participants regarding their decision-making and actions in the past, and regarding current economic performance. For instance, the 'public's understanding of the monetary process' (Winkler 2000) is observable by the decisions and reactions of market agents. Greenspan made the point that the

price level and wage level indicates what people are doing. The task of the Federal Reserve Bank is to evaluate why people do something specific, that is, to figure out upon what kind of a state of confidence are their decisions and actions based. Therefore, a central bank has to achieve an understanding of the opinions and beliefs of market participants. Since there are no direct interactions between a central bank and market participants, it can only get to this level of knowledge by interpreting market reactions and by perceiving market decisions (order and re-order). From my perspective, the experiences of the Volcker and Greenspan eras have opened the path to a broader theoretical horizon in macroeconomics. The modern view on central banking has a pioneering role for further refinements in macroeconomics by intensifying the interdisciplinary approach. Noteboom (1999) provides convincing examples of how the interdisciplinary approach – including epistemology, philosophy of language, cognitive science and sociology – opens up the understanding on how and why organizations, that is, institutions, behave, learn, and act (Voigt 2009).

4
Economics and Language

This chapter discusses a relatively small range of contributions addressing the combined fields of economics, communications, and language.[1] Language is a constituent for scholarly work in economics. Language is used to build and develop certain research tools, methods, and instruments in different realms of economic science. Despite the focus of this book being on central banking, I would like to shed light on the question of how economists have been working on language. Economists are not used to systematically reflecting on their use of language. This chapter presents an overview of how economic sciences have dealt with communication, and it outlines an example of how central bank modelling has been influenced by the acknowledgement of the constitutive roles played by language and changing contexts, that is, by stepping out of the model view.

4.1 Economics, communications, and language

In social sciences the traditional view of a supposed distinct realm of 'pure data' and 'pure theory' is a thing of the past because the data production itself is acknowledged as theory-laden.[2] Furthermore, the constitutive role language plays in the development of theories and descriptive methods has been accepted. First at all, we should remember that the roots of economics are found in philosophy and, hence, moral science, as underscored, for instance, by Smith in the eighteenth century and Keynes in the twentieth century. Let us be specific with the question: How did economists of the eighteenth and nineteenth centuries discuss the role of language in economic theory? How, for instance, do Smith, Locke, Hume, and Cantillon reflect on language in its constituent role, or on language (Blaug 1980)? How did they use language in order to

build up economic theory and conduct economic research (Mirowski and Cook 1990)? What kinds of symbols, metaphors, or signs were developed, for instance by Marx, Mill, Ricardo, and Marshall (Hundt 1995)? Some authors have referred to Mill's pioneering work on inductive reasoning as a possible road for generating knowledge (Erreygers and Jacobs 2005; Blaug 1980). How did economists in the late nineteenth and early twentieth century – for instance Keynes, Menger, von Hayek, Wicksell, or von Mises – reflect on the use of language in economic theories and model building (Muchlinski 2011)? How did these economists view the function of language regarding the tools of economic theory and modelling (Bonadei 1994; Maennel 2002; Priddat 2008)?

Without going into detail, it is possible to argue here that discussions on the constitutive role of language for economic theories and, hence, the 'linguistic turn' in economic literature, were only temporary. The predominant concern regarding language in economics is the question of how language can be used to achieve greater efficiency or effect in communicative interactions by emphasizing language as a public good (Breton 1999), as many publications – particularly from the University of Toronto – have explored. The 'language analogy' as proposed by Winkler (2000) also refers to the efficiency of monetary policy by emphasizing common understanding as a procedure. As was already outlined, he dissociated himself from the assumption of 'common knowledge' in order to shed light on the non-linear process of communication by proposing the use of language analogy with monetary policy.

Beyond the examples sketched in the previous paragraph, postmodern discourse has worked on hermeneutic principles in economics and has tried to examine the role of interpretation in understanding economic theories. Benton (1990), for instance, proposed a hermeneutic approach to economic science and raised the question: 'If economics is not science, and if it is not merely mathematics, then what could it be?' These debates have focused on the role of economic metaphors, symbols, and model-building in order to establish a new perspective and to get into distance to the traditional view, for instance, to the Chicago School. Most contributions have emphasized the uneasiness with the dominant modernist viewpoint in economics, which was often discussed as if the modern approach to economics were without any alternatives (Amarillo 1990). Any contention to define a method of research as being without any alternative must be regarded sceptically. Yet, this has been the case in economics because the model view, deductive reasoning and, hence, a strict formal description, have been the key methods since the 1950s. This cognitive 'straitjacket' is not acceptable (Hillard 1995). This

dominating monomethod – which one might even say is akin to a monotheistic approach – seriously damages scientific work.

Some authors added further considerations to McCloskey's approach to rhetoric and on discourse strategies in economic sciences (Backhouse 1993; Bill 1993). McCloskey restored the significance of language in economics by investigating economics as rhetoric. Closkey (1983, 513) pointed out the credo of economics: 'I am scientist: give way.' Economists should, in her view, first of all reflect that they are engaged in rhetorical interactions and also acknowledge the impact of their rhetoric. Her work on discourse strategies in economic sciences started with thoughtful, provocative articles and ended suddenly at the beginning in the nineties. She expressed her position in this way (1983, 82–83):

> By 'rhetoric' is not meant a verbal shell game, as in 'empty rhetoric' or 'mere rhetoric' ... rhetoric is the art of probing what men believe they ought to believe, rather than proving what is true according to abstract methods; ... it is the art of discovering good reasons, finding what really warrants assent because any reasonable person ought to be persuaded; ... it is careful weighing of more-or-less good reasons to arrive at more-or-less probable or plausible conclusions – none too secure but better than would be arrived at by chance or unthinking impulse.[3]

Rhetoric is based on conversation, and it is this which characterizes economic interactions within social interactions in general. With a pioneering paper on rhetoric, McCloskey attacked the positive-economic methodology as proposed by Friedman and initiated further debates. Most branches of economic research adhere to the widely accepted scientific principles of positivism and behaviourism. The net effect of this view of the scientific method, captured in the idea of modernism, is the hypothetic-deductive method of conclusive arguments arising out of already fixed simple premises. This modernism is assumed to be beyond any kind of doubt or uncertainty (McCloskey 1983, 484).

To put it briefly, modernism is the orientation of the Chicago School. Economists avoid the reflection on its premises and opening up their discussion towards an interdisciplinary approach to economic questions. If economists based their models on the hypothesis of rational expectations and the common knowledge assumption, which they generally do, then uncertainty (and uncertainty about the future) is eliminated by these premises. On the one hand, most economists demand positive-economic methodology as suggested by Friedman, and on the other hand they refuse falsification.

The debate on rhetoric, economics, and methodology turned back to modernism as proposed by Friedman's principles based on Popper's claim of falsification (Henderson Dudley-Evans 1993, 132–152; Muchlinski 1996a, 1998a). The key goals of the accepted methodology of economists, since Friedman's article, have applied modernist principles to economic scholarship as follows:

a) the priority of forecasts,
b) the relevance of forecasts for modelling,
c) the implication that observations require the repetition of experiments and their objectivity,
d) adherence to the criterion of falsification of a theory,
e) adherence to methods of quantification and measurability in analogy with mathematical modelling of physics,
f) the creation and maintenance of scientific procedure by applying methodological rules, and
g) the view that a scientific explanation of an event should be subordinate to an extensive law of economics.

Friedman explicitly proposed that economic scholarship should not reflect so-called realistic assumptions but reliable forecasts which should be tested empirically. Therefore, the mainstream view on economics is that forecasts and empirical testing are the key tasks of economics. The demand for empirical testing created the problem that the results could not be interpreted accurately because of the missing link to economic reality. If the premises are not linked to the contemporary world, given Friedman's advice, how could the result of economic modelling be empirically tested?

Postmodernist economists also criticized modernism's maintaining of knowledge without any doubts, without metaphysics, moral sentiments, beliefs, and persuasions (Medema and Samuels 1996; Samuels 1990). Scientific research and results which are completely free from these concerns will, in the extreme, only provide meaningless standards which are manifested in non-personal solutions.

Another predominant work on methodology beyond Friedman's article is Blaug's (1980) *The Methodology of Economics: Or How Economists Explain*. This book also adheres to Popper's view on positivism by defending abstract and universal principles. McCloskey (1983, 491) objected:

> Words like these flow easily from a modernist's pen. But why would preaching unrelated to actual practice be worth considering at all?

> Why do economists have to defend in the abstract their principles of reasoning, and before what tribunal?

Blaug's demand to differentiate between 'wheat and chaff' in order to implement positivist standards in economic science is no longer convincing. Scientific progress is not achievable by neglecting alternatives or by adherence to rigidly fixed rules or universal principles which lack contexts or circumstances. Devotion to rigid rules of scientific process, modelled in analogy to mechanical procedures, is not a sufficient point of reference in economics as a social science. Economists who are devoted to modernism often start their argumentation with words like 'objective'. McCloskey asked: 'Should it all be "objective", "experimental", "positive", "observable"? Can it be (ibid)?' Of course it is not possible, otherwise the theoretical improvements made by different people and epistemic communities would have been much poorer than they are. As the history of science shows, inventiveness is not based on these principles.

The conclusion by McCloskey is that rhetoric is too narrow. By focusing only on model building, economic science itself has moved towards metaphysics. McCloskey summed up that these – and other – words and metaphors in economics are not merely ornamental but paradigmatic. For instance, the notion of 'elasticity' was first of at all a 'mind-stretching fancy', and the term 'equilibrium' was compared with an apple in a water basin. Many terms are brushed-up, like 'competition' or 'children as durable goods' (human capital), and so forth. They are used as metaphors. A metaphor creates a coincidence of thoughts and a transaction of contexts. For instance, the metaphor 'human capital' brings together two distinct realms by supposing the interdependency of 'human' and 'capital'. Also, the metaphor 'car' and 'central bank' links two separate domains, driving and monetary policy, into a cognitive and emotional relationship by use of language.

But economists do not expressly reflect on this, either. Metaphors, such as the 'invisible hand', evoke certain persuasions or convictions. Most economists, though, avoid elucidating the implications and consequences of such metaphors. Some economists find the metaphor 'invisible hand' impressive and convincing, and imply that nothing has to be explained beyond this and no further discussion seems necessary. The alternative to such modernist tendencies of the sciences is not silence. The alternative to silence is the continuity of reflecting the use of metaphorical language regarding its implication and consequences. McCloskey proposed considering the rhetoric of economics as a reflexive method. Economists do have a great knowledge about the world they have hidden behind an

artificiality of created words or concepts. The use of a reflexive rhetoric would be more effective in order to explain economic problems.

4.2 The constitutive role of language in economic models and description

Models of central bank reality and contexts are driven by the use of language. Economic problem solving cannot be separated from the use of language. Given the fact that a central bank can control only the short-term interest rate, which has long-term effects, and within different interactions in various financial markets, a central bank needs to reflect on its own contribution to the creation of the context which surrounds the decision-making process of both the financial markets and the central bank. The circumstance within which a central bank acts is neither given nor invariant. The meaning of words, sentences, and the understanding are not given. Language as an action of communication configures the context or situation in which any central bank acts. The constitutive role of language has to be recognized for economic models and economic description. One example is the debate on central bank accountability and reputation, which is also driven by changing views of how central banks should implement their mandate.

Brayton et al. (1997a, 1997b) constructed a pioneering econometric model of the Fed. The authors gave an instructive example of the long-lasting process of learning how to link the methods of economic modelling concerning the Federal Reserve Bank and its monetary policy in relation to the building of expectations. They propounded that the aims linking the development of these models to historical contexts and perceptual context in which they have been evolved should be articulated in order to understand its functioning.

They differentiated two generations of macro-models in the Federal Reserve based on the view that adaptive learning and asymmetry of information is relevant. They have created the first generation model based on the IS/LM/Phillips-Curve and the Federal Reserve policy model today (1997, 49).[4] The enlargement of the first generation model (FRB/US) by an international framework, that is, the FRB/Global – also implies the abandonment of restrictions of the IS/LM/Phillips-model. The FRB/Global framework integrated international finance and trade. Brayton (1997a, 47f.) et al. discussed the great efforts made to overcome the bilateral view and its formulation: the substitution of bilateral equation with multilateral equation for describing the economic interdependences of the U.S. economy with the rest of the world.

Brayton et al. outlined the real challenge for the continued process of the improvements of the existing model, namely the specification of functions which could be described by an open economy model of exchange rate determination. The radical revision on this part of the model development was implemented through the 1980s and the early 1990s. Whereas this example demonstrates that the process of the improvements of model building will never stop, other models in economics are seen as invariant. The new macro-models from the middle of the 1990s on have been incrementing both the adaptive expectation hypothesis (vector auto-regression: VAR) and the rational expectation hypothesis (RE). The VAR model describes how agents react against the historical background (backward-looking or adaptive expectation) of inflation, interest rates, output, and the long-run expectations of inflation and interest rates. This model acknowledges the limited information available to the agents. In contrast to this, the rational expectations hypothesis describes the model-consistent, or so-called rational expectations which are supposed to be identical with the model itself.

Using both hypotheses in the FRB/US and FRB/Global the results are significantly different and provide the flexibility of responses which are needed to work within a situational approach. In the paper, Brayton et al. (1997) compared at great length both premises encapsulated in both models regarding the inflation rate, output gap, the Federal Reserve funds rate, and the ten-year government bond rate. But this degree of flexibility should not be confused with 'constantly changing policy advice and interpretation', which is not possible. Brayton concluded all these innovations were linked to theoretical and empirical developments in central bank practice and, therefore, guided the way to the continuity of model improvement. In another paper, Brayton et al. (1997b, 227) pointed out:

> The approach to expectations taken in the FRB/US model is best understood in the context of a debate that has engaged macroeconomists for the past twenty-five years. ... However, they disagree about the basis on which individuals form expectations and thus about the way to model them.

One striking pattern of the model discussion was how to model individual expectations and how to link it to economic modelling and economic circumstances:

> The lack of adequate data has meant that builders of macroeconomic models have had to specify a priori how individuals form expectations.

> Most models developed in the 1960s and 1970s, including MPS, incorporated the simplifying assumption that people form expectations *adaptively*. Under this assumption, for example, the expectation for inflation in the next year is based on the recent inflation trend. Similarly, expected interest rates depend on past interest rates. (ibid)

The innovation of the phenomenon of 'overshooting' investigated by Dornbusch (1976) as well as radical changes of view on how economics should be explained, given by the *New Classical Macroeconomics*, as they also configure the process of macro models by the Federal Reserve. At this point, the 'Lucas-Critique' had become temporarily important (Blinder 1987; Muchlinski 1999a). To sum up:

> The rational expectation hypothesis implies: 'Rational or model-consistent expectations are identical to forecasts produced by the macroeconomic model in which the expectations are used. This assumption has been used in many macroeconomic models developed in the past fifteen years and is one option for the formation of expectations used in FRB/US'.[5]

Reference to the approaches and assumptions above has been brief for the sake of simplification; that is, the assumption presented here of adaptive or rational expectations is not the ultimate state of research in economic modelling. This approach to modelling does not provide the knowledge or understanding economists need to understand mutual and complex interactions among the central bank and the private agents of financial markets. Consequently, Brayton et al. (1997b, 229) stated:

> Thus, individuals form their expectations of the future using rules of thumb or easily computed formulas, such as adaptive expectations. At the other extreme is the view underlying the rational expectations approach. In this case, collective and analyzing information is assumed to have small costs and large benefits, and consequently individuals base expectations on sophisticated forecasting models that make use of all relevant data. Between these extremes is the view that forecasting has both significant advantages and significant costs. Such a circumstance should lead households and firms to choose forecasting models that closely resemble their economic environment but fall short of a complete model of the economy in every detail. In FRB/US, one of the options for expectations formation, referred to as VAR expectations, is motivated by this view.

As the assumption of VAR expectation shows: models which work on this assumption do not follow the assumption of perfect information but of forming expectations on the basis of selected information. These methods draw attention to central banks in historical time and space. Central banks do not interact in universal time and space, but in situational contexts and circumstances. As Brayton et al. (1997a, 230) wrote:

> [T]he VAR approach in the FRB/US model assumes that households and firms form expectations primarily on the basis of their knowledge of the historical interactions among three variables: the Federal Reserve funds rate, the cyclical state of the economy, and the rate of inflation.

Modelling assumptions which refer to historical and situational contexts imply the abandonment of the rigidly fixed premises of most models. Working with VAR expectation, for instance, allows simulating how quickly or slowly a change in monetary policy – say the tightening of the money supply in order to reduce inflation and inflationary expectations – will be perceived by the agents of the market. An immediate perception of a change in the monetary policy would be associated with an immediate perception of inflation expectations by those operating in the financial markets. Model consistency concerning the expectation-building process – for example, the anticipation of a future change in monetary policy – can be constructed alongside the incorporation of information the firms and consumers acknowledge in making a forecast. To model the VAR expectation includes 'advance recognition' by specifying the expectations regarding both long-term inflation and interest rate which 'respond before the event' (ibid).

As Brayton et al. described, the emergence of the economic sense regarding central bank strategy, decisions, and actions is based on history and the use of language. However, to read and understand a model on central banks one needs to be trained in mathematics. Yet, one also has to acknowledge that economic questions, phenomena and problems are due to everyday perceptions and everyday language. At this point it should be mentioned that economic problems are not rooted in the vagueness and the non-exactness of everyday language. The problems as described by modern central bank literature are expressed in everyday language since they arise out of mundane contexts.

What can be drawn from the example put forward by Brayton et al.? If central bank literature refers only to deductive reasoning, that is,

to the model views, it misses the point and it can not explain how central banking works. Central banking does not function as deductive reasoning but rather as a reflexive procedure of different methods and instruments, hence new literature on this issue enlightens the effect of communicative interactions. If central banking or economics concentrate only on deductive reasoning, this 'formal aestheticism' (Morishima 1991) will exclude important topics of research and will lead to an impoverishment of scientific skills. I would like to emphasize that economics as a social science needs to enlarge on traditional economic methods and develop additional methods and instruments beyond such monopolistic methods.

One can take the example of the gold standard, as discussed in textbooks, by its supposed 'rules of the game'. The central banks were accustomed to acting as if the conditions of such a gold standard applied (Tullio and Wolters 2003). According to historical investigation, the gold standard came into existence as an international agreement on the international rules of the financial system (Flanders 1990; Spahn 2001). This meant, though, only insofar as a few central banks, particularly the Bank of England and the Federal Reserve Bank, had started to coordinate their policy of interest rate settings. It was on this basis that such rules of the game could be developed and implemented (Mundell 2000). No rules in social sciences become accepted as hidden rules. The rules of the gold standard may be seen as an aid to for organizing and commencing a particular game, but the fact was that the rule came into reality as the real practice of central banks, that is, inasmuch as the central banks used it to start to coordinate their policies. The context of central banks in modern society, and its link to the constitutive role of language, can be explained by referring to the discussion of different monetary policy regimes (Issing 2005b; Fracasso et al. 2003; Friedman, B. 2004; Kuttner and Posen 1999).

4.3 Meaning, intention, and utterance

In order to outline the complexity of communicative interactions, I have introduced a conceptual framework focusing on distinct dimensions. I referred to Giddens on the interdependence of structures and actions; to Bourdieu on habitus and its social impregnation; to Habermas on understanding by discourse and by agreement; to Searle and aspects of the 'speech act theory', and to Davidson on understanding by communicative interacting and by interpretation. I focus here on the theoretical foundation provided by Grice. Grice's theory can be outlined

in three steps: (4.3.1) the speaker's intention and meaning, (4.3.2) the principles of cooperation or postulates of conversations, and (4.3.3) the theory of 'implicature'. Grice contributed to language philosophy through his theory of conversation comprised of these three steps.

In current economic literature, references to Grice's work are prominent in language philosophy literature and also in game theory. For instance, Ariel Rubinstein (2000) built his theory, 'Economics and Language', upon Grice's view. As Rubinstein's work has already been discussed in economic literature, Grice stated that his approach to communicative actions entails the common acceptance of methods of communication, that is, the principle of communicative cooperation and associated maxims, which he supplemented by a new term, 'implicature'. Grice's famous proposal concerning the realm of the theory of communicative interaction is his theory of implicature (Grice 1989). The concept of implicature is based on Grice's differentiation between the speaker's utterance and the speaker's meaning. The speaker's meaning is to be seen as the speaker's intention. As we will see later on, Grice's theory of communicative interactions remains focused on the speaker's intention (Grice 1957/1989). According to Grice's view there is no difference between meaning or intending something with an utterance (Grice 1969).

4.3.1 The speaker's intention

Grice interpreted meaning in the manner of the questions, 'What do you think or what do you believe?' or, 'What do you mean by this?', that is, 'What is your opinion?' Grice provided a theory of meaning in which the term 'meaning' is based on a speaker's intentions and on what she or he thinks. The interpretation of 'meaning' by Grice differs from its meaning in modern language science, in which the practice and use of the word or sentence has been emphasized. Moreover, it differs from linguistic science in regard to the extension of the meaning in the semantic field (Trabant 1986). The term 'meaning' in ordinary language often refers to imagination, ideas, or persuasions. However, it also refers to ancient philosophy and the view that meaning is embedded in the mental state, soul, or consciousness of a person. The word 'idea' goes back to Aristotle. In light of this philosophy, the term 'utterance or expression' was interpreted as the expression of a mental state or of the soul (Brentano 1956, 24). Therefore, the utterance or expression ('hermeneia') was understood as the expression of the soul. According to this Latin tradition, which can be categorized as *de interpretatione*, the function of language was seen as a vehicle of the mental state, thoughts,

or the soul and, hence, as neutral towards mental states, thoughts, and the soul (Trabant 1999). Therefore it was argued that intention as interpreted by a mental state or soul needs a medium of transmission to be articulated and in order to be communicated. The Aristotelian philosophy is seen as 'Aristotle hermeneia'. As I have already mentioned and will explain in Chapter 5 in detail, Analytical Philosophy states that language has a constitutive role – and, hence, is *not* neutral to thoughts.

Grice objected to the view that a 'standard of meaning' contributes to the meaning. The view of a standard of meaning harks back to causal theory, such as 'John is tall' is part of the meaning 'John is an athlete' (Grice 1989, 216). Causal theory maintains there is a standard meaning of signs independent of their use. Any causal theory, therefore, ignores 'the fact that the meaning (in general) of a sign needs to be explained in terms of what users of a sign do (or should) mean by it on particular occasions' (Grice 1957, 217). Grice refused the view of a 'standard meaning' of signs because the meaning of an utterance is not identical with the meaning of the signs being used. He objected to the view that language is based on the use of precisely defined signs. 'What (does) a particular speaker or writer mean by a sign on a particular occasion (which may well diverge from the standard meaning of the sign)' (Grice 1989, 216).

Grice linked the speaker's utterance with his meaning and intention. 'I use utterance as a neutral word to apply to any candidate for meaning$_{NN}$; it has a convenient act-object-ambiguity' (1989, 216). The speaker's utterance is the way the meaning has developed out of his intention. Only in certain respects is it possible to argue that Grice advocated speech act theory. The speech act theory (Austin and Searle) emphasized that talks, speeches, and sentences imply the upcoming actions by the listener as a so-called 'performative' form. Speech act means a way of acting. For instance, if person A says 'close the door', the listener, person B, will act to close the door (or maybe will not act). Or if person A says 'I promise to return the book I lent to you', person B (listener) anticipates the action. In respect of speech acts, it is not possible to apply criteria of truth or falsehood to them. Traditional language philosophy stated that a sentence is truth only if, and insofar as, it corresponds to reality.[6]

In Grice's view the speaker's utterance also indicates the speaker's intention, which has to be received by the hearer or the audience. Regarding the relation of speaker and hearer, Grice stated that such relations are highly dependent. However, the role of the speaker is to transmit his intention to the hearer in order to be perceived in the

intended manner. We should read the quotation as a whole, given by Grice (1989, 219):

> A must intend to induce by x a belief in an audience, and he must also intend his utterance to be recognized as so intended. But these intentions are not independent; the recognition is intended by A to play its part in inducing the belief, and if it does not do so something will have gone wrong with the fulfillment of A's intention. More over, A's intending that the recognition should play this part implies, I think, that he assumes that there is some chance that it will in fact play this part, that he does not regard it as a foregone conclusion that the belief will be induced in the audience whether or not the intention behind the utterance is recognized.

Grice (1989, 220), hence, defined the meaning, that is, the speaker's meaning, as an expression of his or her intention:

> 'A meant something by x' is (roughly) equivalent to 'A intended the utterance of x to produce some effect in an audience by means of the recognition of this intention'.

In ancient philosophy the recognition of the utterance of the speaker by the hearer is regarded as the transference of intention by neutral language. According to this view, language matters as a neutral transmission. It is a vehicle or veil of thoughts. In other words, the intention or the mental state has been sent from the speaker to the hearer through language. However, particular problems in Grice's thinking still remained. If, for instance, the effect the hearer had realized was caused by the speaker's utterance, what gives reasons to conclude from this that the hearer also received knowledge about the speaker's intention? Grice conceptualized this as follows: whereas the speaker acts, the hearer reacts simultaneously. This line of thinking brings us to another crucial element in Grice's view. Any speaker's utterance causes an 'act-object-ambiguity' according to its purpose (see above). This implies ambiguity regarding either the sound or the content of an utterance. One asks what should be recognized more, the sound *or* the content? Beyond that, one might ask why should such a distinction be made? The 'act-object-ambiguity' draws attention to the result of an action and to the utterance as an action itself (the expressed sentence).

Given this line of argumentation, Grice followed in the footsteps of Aristotle, who distinguished the realm of actions into three aspects: (a)

acting as an action, (b) acting as a potential of an action and (c) acting as a result of an action. Grice, then, moved a small step forward trying to refine the constituent role of language.

Grice remained defending these three distinct realms while neglecting the research by Humboldt, Wittgenstein, and modern language scientists. Both Humboldt and Wittgenstein argued that language and reality are inherently connected because of the constituent function language has. There exists no external rule which can be applied or can assign language to different realms of reality. Since Humboldt's research on language, scholars have objected to the view that language can 'apply to' reality.[7] The modern view of language and, hence, the so-called 'linguistic turn', emphasized that different uses of language constitute views or perceptions on reality differently.

As outlined, Grice's concepts of meaning were rooted in the speaker's intention. Nevertheless Grice left it open to debate if the intention as a reference should be interpreted in the sense of idea, imagination, or opinion. The common goal of the communicative action implies that the speaker has to mention reasons so as to assume that the hearer is able to appreciate what is said as a consequence of what the speaker had said. The speaker must have grounds to suppose that the hearer understands according to the action itself because the action is identified with the utterance. According to the above quotations, the goal of a communicative action is described by the effect of the action. Grice had replaced the term 'beliefs', which he had used before, with the term 'effect'. The term 'effect' allows more space and a broader framework in his approach to communicative interactions as being observable by effects. In saying that the goal of communicative action is its effects, one is inclined to associate this with something perceivable. To use the term 'effects' allows us to avoid association with inner, or mental, processes of the speaker. Furthermore, Grice assumed that the term 'effect' would permit the integration of the reactions of the listener into his model of communication.

If one asks about the reasons for a communicative action then we assume that the action is based upon specific grounds and upon rationality. If the question about the intention of an action is analogous to the question about grounds, then grounds have to be recognized as such. If we interpret Grice in the way proposed, for example, by Wright (1975), that the "utterer's" intention is neither identical with his plan nor with his imagination, idea, or persuasion, then intentions can be interpreted as a part of a communicative action. Nevertheless, this kind of interpretation would touch only slightly on the constituent function of language as introduced by modern language philosophy.

What might support Wright's interpretation is that Grice replaced his early term belief with the term effects in order to point to the results of a communicative action. Grice also combined this substitution with the presupposition that the effect of an utterer's intention, that is, the action, can be controlled by the hearer. But, as we will see later on, this supposed control is an illusion. Grice tried to incorporate the active role of the listener within the communication dynamic so as to limit the key role of the speaker's intention. Grice (1969, 92) tried to explain his efforts to integrate the listener into his model of communicative interaction with the following definition:

> '*U* meant something by uttering *x*' is true if, for some audience A, *U* uttered *x* intending: (1) A to produce a particular response r, (2) A to think (recognize) that *U* intends (1); (3) A to fulfill (1) on the basis of his fulfillment of (2).

What at first glance seems to be circular reasoning could be interpreted as deductive reasoning based on the underlying presupposition that the speaker wants to cause certain effects on the hearer. Communicative action will take place only if the hearer understands what *should be understood* according to the speaker's intention. Grice explained that his definition shows that the audience (A) understands the intention of the utterance (U) not as caused effect but rather by reasoning (ibid).

Grice demanded two kinds of intention: (a) the speaker's intention to evoke a certain effect by the hearer, and (b) the intention that the hearer is recognized (a). Moreover, Grice asserted a particular relation between both (a) and (b). The recognition of (a) through the hearer should lead to the intended effects, understanding by the hearer. Grice, then, claimed that he had integrated the recognition by the hearer.

If we relate the above consideration to a central bank – (a) its mandate of steering the inflations expectations of (b) the listener, the agents in the financial markets, by setting the nominal short-term rate in order to fit the goal of long lasting price stability, we might grasp the example immediately.

For instance, Goodfriend (2005), among other authors in modern central bank literature, relates the communication of a central bank to the mode of a transferred intention from the central bank to the audience, that is, the agents in the financial markets. Goodfriend emphasized that a central bank needs to anchor the inflation expectations of the financial markets in order to derive the benefit of enlarging the flexibility of interest rate policy. 'Recent theory and practice ... teaches

that a central bank enhances the performance of the market by creating an environment of dependable low inflation' (2005, 253). Even if it is undisputedly a central bank's genuine task to steer market expectations, this does not imply that steered market expectations are to be interpreted as a transformation of the intention of the central bank to the audience. However, serious doubts arise as to whether the aim of a central bank to steer market expectations can be explained by reference to Grice's model of conversation and communication. I consider these doubts in Chapter 5.

Before I turn to the second issue of Grice's view as mentioned in the beginning of this chapter, I would like to summarize the critiques made of his first issue. My criticism of Grice is as follows: this strong presupposition of Grice that the hearer knows the speaker's intention implies that the reaction of the hearer is symmetrical to the speaker's intention. Both speaker and hearer have reasons to communicate, that is, a common goal. According to the presumed symmetry, both agents create the understanding actively. Grice stated that this symmetry enlightens his theory of dialogue. The hearer recognized the intention of the speaker towards the creation of a certain effect.

Doubts arise as to the premise of whether it is possible that the speaker is able to intend what has been assumed in this model of communication. Grice's answer to this is that intentions are more like the aims of a reconstruction and are to be seen as the minimum condition of every communicative action. Communicative actions without intentions do not make any sense. The same is true for actions without rationality and grounds. I think the notion that communication without intention is meaningless misses the point because doubts are reasonable as to whether the listener's reconstruction of the intention of the speaker is identical with the intention itself, or is rather an interpretation of the presumed intention of the speaker. Grice stated that the reconstruction is based on inductive reasoning.

However, this inductive conclusion to meaning lacks clarity as to how language functions. The meaning of a sentence does not label an object or a thing; rather the meaning refers to the interactive communication in the context. The general meaning neither evolves by inductive reasoning, nor by the process of the indefinite analysis of the meaning into its simple components.[8] Every person operates with words and sentences uniquely in each different situation with respect to the given general meaning or acceptability. This is why Humboldt explained that the variety of world views and of understanding is constructed and combined through the variety of the use of language. Grice undertook

several attempts to move beyond the traditional theories of meaning which are focused on the property of a word or its truth. He stated that it is most important to address the speaker's utterance, that is, action, in order to grasp the meaning.

We have to ask how the hearer in Grice's world could know whether he understood the speaker's utterance? While Grice stated that the hearer identifies the speaker's intention, he left it open as to how this knowledge should be possible. Grice maintained that the action mirrors the speaker's intention – given the capability of the hearer to interpret. Following Grice's line of argumentation the term 'meaning' is a manifestation of the speaker's intention, which the hearer already knows. He supposed a symmetry of both the speaker and the hearer. No distinction is made between a speaker's and a hearer's intention. Nevertheless, the hearer should be the one who controls the effects of the communicative interactions given the speaker's intention. Insofar as the dominant role of the speaker's intention still remains in Grice's approach, his attempt to integrate the hearer into communicative action theory also fails. Grice stepped away from the traditional conduit metaphor. He also criticized the stimulus-response mechanism modelled as a linear sender-receiver relation. In his first step, Grice presupposed the given meaning of the speaker's intention as perceived through action by the hearer. In his second step, however, he neglected that the meaning is something which is developed within the communicative interaction itself.[9]

4.3.2 The principle of cooperation or postulates of conversations

I turn now to the second element of Grice's approach. He proposed a principle of cooperation and associated maxims and the term 'implicature' to improve his theory of communicative action. While economists refer to Grice's principle as a renowned theoretical approach to communication, they do not discuss the important implications and conclusions of his approach for economic discourse, and this will also be considered in the discussion. Grice attempted to precise communication as a regulated procedure. He argued that communication procedures are based on rational and economic principles. The use of language is as being linked to its economic usage and based upon the consideration of trying to say as much as possible by the use of little and plain words.[10]

The principle of cooperation implies: 'Make your conversational contribution such as is required, at the stage at which it occurs, by the accepted purpose or direction of the talk exchange in which you are engaged' (Grice 1989, 26). The principle of cooperation is conceptualized as a rational mode

of communication and is focused on the understanding. The inherent consideration of the first part of this principle has widely been accepted in the literature although the second part, that is, 'the accepted purpose or direction', is still controversial because it is not clear what 'the accepted purpose or direction of the talk exchange' means. I find it neither conclusive to argue that communication is a 'talk exchange' nor that the direction of the communication has to be given in advance. This reminds me of the 'conduit metaphor' suggesting communication is a linear directed path from the sender to the hearer. The maxim of rational communication should initiate communication by aiming rationally at a mutual goal, that is, aiming at the effect of a communication. Understanding should thus be seen as the result of an assumed rational mode of communication.

The cooperation principle, or principle of conversations, was specified by Grice (1989, 28) by way of associated maxims – four postulates of conversations – which he defined as analogous to those of Immanuel Kant: quantity (*be informative!*), quality (*do not fool the audience, provide truth!*), relation (*be relevant!*), and manner (*provide clarity!*).

What is meant by this? The maxim *quantity* deals with the maxim of information, *quality* of information with the supermaxim, *relation* with both agents, sender and receiver, in the communicative interaction and the aspect of *manner* as providing as much clarity and communicative performance as possible to the situation. Grice thus defined the principles of conversations by definitions (1989, 26–27):

(I) Quantity:
   1. Make your contribution as informative as is required (for the current purpose of the exchange).
   2. Do not make your contribution more informative than is required.

(II) Quality: Try to make your contribution one that is true.
   1. Do not say what you believe to be false.
   2. Do not say that for which you lack adequate evidence.

(III) Relation: Be relevant.

(IV) Manner: Be perspicuous.
   1. Avoid obscurity of expression.
   2. Avoid ambiguity.
   3. Be brief (avoid unnecessary prolixity)
   4. Be orderly.

The maxims and subordinated maxims listed in the quotation above are related to each other. For instance, the maxim of quality and its

subordinated maxims are not to be taken in isolation; rather, they play a role within these principles of conversations as a whole. The maxim 'be relevant' makes sense together with the maxim of both quantity and manner. To utter something which is relevant will establish a line towards the goal of communicative interaction.

The above principles are often cited in theories of communication and language philosophy (Kober 2002). They are accepted as guidelines for communication by which the authors begin their own considerations so as to move further towards particular theoretical approaches (Stekeler-Weithofer 1999; Scholz 2001).

Grice introduced this principle of cooperation or the postulates of conversations as a normative rule. What does it imply? We normally do not want to irritate or to fool other participants in dialogues. The principle of cooperation, therefore, frames most communications with a view to rationality. As a normative rule it should frame communicative interaction generally because people aim at certain effects of communication. People aim to follow these principles in order to achieve their aims.

As the quotation above reveals, the principle of cooperation is oriented to the speaker. The speaker utters a sentence within a certain situation, which also indicates that this sentence should be interpreted as a rational contribution aiming at a mutual accepted purpose of the communication. If understanding is seen as a presumed connection to rational communication, then the effect of understanding is guaranteed. The hearer, then, interprets the utterance of the speaker as a contribution aimed at that mutual purpose. The hearer should rationally avoid interpreting the speaker's utterance as an objection to this mutual goal which he or she shares with the speaker.

However, in my view, this should also point towards the context. The maxim 'avoid ambiguity' and 'avoid obscurity of expression' is addressed towards the idea of rationality of communicative action as outlined previously. It can be read as an appeal to the actors in their aiming at the common goal. But this maxim also can be seen as a demand for applying traditional scientific principles addressing an exact, measurable, and non-ambiguous process which has to present exact, non-ambiguous, and measurable results in order to fulfil the common sense view of science, as rooted in the principles of Descartes and Leibniz. Grice, however, neglected the possibility and necessity of error, of deception, and of the bounded possibility of exactness, of the non-ambiguousness of science and knowledge.

Of course we shall ask why the speaker should act in such a manner as proposed by the cooperative principles and associated conversational maxims put forward by Grice? His answer was,

> It is just a well-recognized empirical fact that people do behave in these ways; they learned to do so in childhood and have not lost the habit of doing so; and, indeed, it would involve a good deal of effort to make a radical departure from the habit. (Grice 1989, 29)

Here again, he presupposed the rational action as the basic pattern of any action. Acting reasonably is to be seen as a common goal because it makes no sense to refuse it. Therefore, Grice proposed supporting a kind of conversation that implies principles for both the sender and the receiver. Moreover, he assumed what has to be accepted by the speaker is also a 'must' for the hearer. There is no escaping this principle of cooperation and the associated maxims. Grice denied delivering a normative claim to communication (1989, 29). He appealed to a certain kind of relationship between the agents, which he compared with a car accident and the expectation that another person who perceives that accident is willing to help, to coordinate with the person who is a victim of the accident. Therefore, both are motivated to communicate or coordinate and, hence, this is characteristic for every communication. Grice concluded that any communication aims to 'distinguish cooperative transactions' (1989, 29). However, in comparison with Habermas's approach to understanding, Grice draws attention to communicative interaction as a certain type of rule-following communicative behaviour and not as the mode of developing a way of communication in order to reach a common goal.

As the quotation above indicates, Grice based his view on two key arguments: (a) on the inductive-probabilistic argument, and (b) on a particular consideration regarding human behaviour. The roots of the principle of coordination are to be found (a) in the methods of the empirical science and (b) in evolutionary pattern. Along this line of argument we also find these principles as parts of the scientific process combined with a particular view of human nature. To focus on this explanation one has to ask what role is left to circumstances, contexts and culture? Unfortunately Grice gave no answer.

Understanding requires us to recognize the context and to apply hermeneutic principles to the communicative interactions, such as the assumptions of coherence and rationality or truth. The assumption of rationality is – as explained above – a prerequisite of any communicative

action which aims towards an understanding. The assumption of truth refers to credibility of the communicative actions by the agents involved. Reference to a conventional meaning or towards external rules of language is not possible. The conventional meaning of a sentence only provides the fragment of a proposition. Let us take the example of understanding utterance at a press conference held by a central bank official. The maxim relevant for consideration is:

(II) Quality: Try to make your contribution one that is true.
    1. Do not say what you believe to be false.

A central bank press conference mostly entails two main parts: the speaking activity of a chairman or speaker of the central bank and a written document. Beyond this written document the usual case is that the chairman or speaker proceeds to answer the questions put by the interviewers. According to the reasons explained, in light of the modern view of central bank theory monetary policy works *through* markets.

Let us expound on the textual horizon of this maxim, (II) Quality. If, for instance, the sentence runs: 'No further interest rate change is to be expected', in its literal and lexical manner the sentence implies that there will be no increase. The reporter judges the implication of this sentence: Does this sentence imply that there will be no further increase of the interest rate this year although, considering economic indicators, it would be necessary? What does the literal meaning and the implication of the utterance initiate? The interviewers at the press conference, or the public reading the reports, might have doubts about the truth of this sentence because high domestic growth and prices present another scenario of the current performance of the economy.

The reporter believes that the information by the central bank is not true because it does not fit with the economic indicators. The statement of the central bank would appear to violate the principle of cooperation. The public might argue: Does the central bank base its judgment upon the actual empirical economic performance in a way different from the public? If so, on what grounds? Does the central bank have different data about the economy than the public does? The public, then, attempts to find out from this press conference the differences between the data or the foundation of judgments upon which the central bank bases its decisions and expectations compared with the data the public has. If the assumption of a different data base is not supported by

evidence, the reporters will not be convinced. Understanding will fail because the statement of the chairman violates the *maxim of quality: 'Do not say what you believe to be false'*. If the central bank has similar data, the statement by the chairman or spokesperson at the press conference does not make any sense.

Let us turn back to the sentence used as an example above, 'No further interest change will be expected'. According to a perceived economic situation – as we assumed in the example on the foregoing pages – this sentence is not convincing. This sentence will be judged as wrong or as the central bank's attempt to lie and violate the principles of cooperation. Literally, the chairman has said that the interest rate will not be changed, but this apparently makes no sense at all.

4.3.3 The theory of 'implicature'

According to the literature, Grice contributed to a theory of dialogue by emphasizing his newly created term *implicature*. This is a technical term which is related to both the speaker and the hearer. The concept of implicature outlined the idea that any utterance also neglects information and knowledge which have to be provided or supplied by the hearer (Grice 1989, 24). I would like to add that the implication or implicature also needs to be anchored in the respective context or circumstances. Grice stated that we understand a sentence beyond its literal meaning; we understand it by its implication, which he defined by the technical term implicature. By this additional term, implicature, he further advanced the 'indirect speech act theory' of Searle (1995) towards hermeneutic principle. For instance, if person A says to person B 'Could you pass me the bread and butter, please', it is expected that person B handle bread and butter. Person A does not expect the answer 'no' or 'yes'. If person B answered 'no' or 'yes' then we could judge that B has misunderstood the speech act or is not willing to cooperate with A. Person A's speech act is a request and not a question. Searle (1995) called this an 'indirect speech acts'.

The 'indirect speech act' entails an implicit sense regarding the situation in which the sentence is said. Therefore the 'indirect speech act' implies a pragmatic or implicit sense beyond the literal meaning of the sentence. The indirect speech act lets us understand both the content and the modus of the sentence. The indirect speech act complements the principles of interpretation which need to be bounded by contextual factors. As was already outlined in Chapter 2, the context itself has no boundary.

Let us be more precise: the implicature is the additional content ascribed to the speaker's utterance in order to secure the common goal of the communicative interaction and understanding. To judge

confidently the central bank's spoken language, the participants at the press conference assess the statements against their own economic knowledge, information, and the current economic background.

In this example, then, the statement of the central bank obviously violates *maxim (II) 'Quality: Try to make your contribution one that is true'.* If data pointing to a high growth rate, and rising prices and wages in the domestic economy exist, the sentence will not be acceptable as true. As we know, the *maxim of quality demands: 'Do not say what you believe to be false.'* However, the spokesperson's statement, 'No further interest rate change is to be expected', is misleading if the participants at the press conference believe the sentence is not true for reasons explained in the foregoing paragraph.

This example sheds light on the understanding of the sentence, which depends not on the lexical meaning of the words of which the sentence is composed but rather on the perceivable economic context which surrounds the press conference and the communicative interactions of the involved participants. Most of the words used in a spoken language – speeches, discussion, interviews – and also in written language – statements, comments, reports – are vague and ambiguous in a lexical sense: that is, their meaning is not fixed lexically. To understand, then, requires shedding light on the context or practice within which, or through which, the word or sentence has been used (Bach 1994). Without doubt, for economics as a social science it is of great interest to deal with these questions on how meaning evolves and how sentences are understood in different circumstances.

At this point, monetary policy or central banking leads directly to such questions of understanding. These questions of understanding and meaning inevitably enlarge the traditional view of economic science. Regardless of famous examples in the history of economic science, the understanding and the evolution of meaning in economics as a social science have not been a topic of economic theory until now. Since modern central bank theory and policy have moved towards an interactive approach of both the central bank and the agents of the financial markets, the understanding and the evolution of meaning in economics have assumed great importance. How can a central bank or the chairman of the central bank know if and how the public has understood the released information?

I now want to discuss another maxim regarding the principles of cooperation:

2. Avoid ambiguity.

Let us apply this maxim (IV) to another example: if the chairman of the central bank says in a press conference, 'The interest rate will rise up to 3.5 percent', the public will understand this sentence in its literal meaning as well as take the history and the current economic performance into account. The public recognizes that the interest rate was before at the level of 3.25 percent and it also knows that during the last 12 or 24 months the interest rate has risen step by step. In a literal meaning, the statement of the chairman implies an increase up to 3.5 percent. It does not imply further decisions at all. Regarding the modern view of central banks, the public assumes the chairman has stated the truth. Moreover, the public supposes that the information release was done for the sake of clarity and information and not to fool the public. The public understands the utterance within a context which goes beyond the released information. The public supposes that the chairman, like the public itself, knows that the future level can differ from the actual level of 3.5 percent. This presumption is inevitably connected with the enlargement of the expressed sentence by a greater content, that is, by implicature.

To put it more precisely, because Grice did not discuss it with clarity, the implication does not refer to the mental state or intention of the chairman but to the context in which the sentence had been used. As we have already outlined, Grice assumed the maxims on quantity, quality, relation, and manner, and its subordinated maxims guide the understanding, for example, *maxim (I) 'Quantity: Do not make your contribution more informative than is required'*. Grice took this to open to debate how the general cooperative principle could guide a person's action and expression in a concrete situation.

The term implicature rests itself on the cooperation principle. In making a distinction between the speaker's intention, the meaning and its implication on the one hand and the utterance to be perceived and interpret by a hearer on the other hand, Grice distinguished between what can be understood by conventional meaning and what cannot. He, then, assumed the speaker's utterances can be differentiated by (a) what the speaker says and what has been understood by the hearer, and (b) what is meant with the utterance, that is, what has been implicated. Grice differentiated the 'implicature' of an utterance into (b.1.) 'conventional implicature' and (b.2.) 'non-conventional' or 'conversational implicature' (1989, 24).

The conventional implicature (b.1.) entails the literal meaning of the utterance or the sentence. Its understanding is based on conventions, that is, given understandings or practices. The conversational

implicature (b.2.) encompasses the literal meaning of the sentence and those parts which are not literally uttered in the sentence but which are parts of the communicative interactions. For instance, if the speaker's utterance contradicts the principles of cooperation and associated maxims, the hearer, then, has to judge this contradiction through an interpretative approach. The hearer asks: 'How can his statement be reconciled with the supposition that he is observing the overall Cooperative Principle?' (Grice 1989, 30). The hearer works out, or infers, from the conversational principle how the speaker's expression should be understood. The hearer assesses whether or not the speaker has left the cooperative discourse, that is, has already avoided aiming at a common communicative goal.

Box 1 provides a short cut:

Box 1 Grice's theory of implicature

Presupposition (I): The understanding is a result of (a) inductive-probabilistic reasoning & (b) prudential reasoning

Presupposition (II): The speaker's perspective, i.e. utterance, matters.
The speaker's utterance is differentiated into:
a. What the speaker said, utters, i.e. what has been understood &
b. What has not been said, i.e. what has to be implicated:
('the implicature of an utterance')

Presupposition (III): The implicature of an utterance is distinguished into:
b.1. the conventional implicature, i.e. the utterance
b.2. the non-conventional utterance, i.e. the conversational implicature (which entails non-verbal utterances)
Short: b.1. & b.2. encompasses verbal & non-verbal considerations

Conclusion: Presupposition (I) to (III): Conversational implicature roots in efforts of the hearer to interpret the speaker's utterance as compatible with the principles cooperation – at first glance it has seems to be not the case.

The conversational implicature is the part ascribed to the speaker in order to secure the common goal of the communicative action. It should give support to the view that the speaker does not threaten or damage the principles of cooperation. This is why Grice argued that the competent speaker has the feasibility to let the hearer understand what should be understood, that is, the competent speaker exploits the conversational maxims. Grice stated succinctly that the speaker gives the hearer to understand what should be understood. However, the speaker's dominance still remains. The speaker guides the understanding of the hearer. Only in the case that there is no content able to be implied

at all will doubts arise as to whether the speaker is still acting cooperatively. According to Grice, adherence to the principles of cooperation, then, should guarantee understanding.

As already mentioned above, while the consideration that utterances mostly are subject to implication has been widely accepted in the literature, the further distinction made by Grice between 'conventional implicature' and 'conversational implicature' has not. Furthermore, Grice's assertion that any communicative situation moves beyond the 'exchange of knowledge and information' according to conventional and conversational implicature is hardly acceptable. He presupposed a mutual knowledge condition which is, of course, a rigid premise regarding the role of the speaker's implicature. I doubt that by stating the mutual knowledge condition it could be possible to assume that knowledge or information could be exchanged in a dialogue. I return to this point later on, outlining why knowledge or information has to be understood, and not be exchanged like a car or stone. A key assumption of this book is that *information* is considered as *a related object*, hence as *information processing* as outlined in Chapter 2.

One objection to Grice's emphasis on the speaker's framework shall be made now: The speaker's implicature is rooted in the speaker's framework, that is, the speaker's intention, and not deducible from the general cooperative principle. In this, by emphasizing the generality of the principle of cooperation. Grice neglected the social function of rules and conventions.

What relevance does such a general rule have in changing contexts? Since Grice introduced the principle of cooperation and conversational postulates as a normative rule, one might ask how its acceptance has been achieved? Only in the case where doubts have arisen about the validity of the general principle will the principle itself become a matter of debate because of the varieties of those differences which have emerged. He introduced the speaker's ability to exploit the conversational implicature, that is, the speaker's ability guides the understanding of the hearer. It is for this reason that Grice identifies the speaker as competent.

If we accept Grice's view we can conclude the speaker implies the principle of cooperation and its associated maxims by defining certain presumptions in order to achieve the communicative effect.

One remarkable point is that the theory of implicature introduced by Grice leads to a further important hermeneutic principle Grice himself did not work out. Given his emphasis on the speaker's competence to 'exploit' the conversational implicatures, this can be reread as the

speaker's ability to apply hermeneutic principles to the interactions with the hearer. Scholz (2001, 160) proposed expanding Grice's approach to communication and language towards a 'presumptive rule'. The history of language philosophy is acquainted with such presumptive rules as hermeneutic principles. Presumptive rules function as methods to structure arguments or judgments, to conceptualize a justification or objection, an interpretation or communicative interaction (Dennett 1978, 1987; Davidson 1984; Quine 1953, 1991, Trabant 2008).

A presumptive rule also implies certain considerations of rationality regarding the communicative interactions which Dennett (1978, 242, 247, 272), for instance, defined as 'assumption of rationality' and 'presumption of rationality'. He described it as a rational hermeneutic principle in order to underline the aspect of understanding as being inherent in all communicative interactions. It is noteworthy here that the rationality assumption is not linked to the economic principle configured as *homo economicus,* but rather devoted to a goal-oriented interaction of people (Muchlinski 2006; Simmons 2006; Sullivan, Snyder and Sullivan 2008). To act in a certain manner and to communicate in a particular way also implies the strategy of coming into contact with another person. In contrast to this view, the theoretical construction *homo economics* is a non-interactive, autistic individual who acts in order to achieve his or her own benefit. Humboldt defined aiming at the other person as reaching 'you' (meeting the other person), whereas Davidson described it as a 'principle of charity' and as aiming towards 'the second person'; Martin Buber (1977) defined it as 'partner of dialogue'. Dennett (1978, 9) wrote:

> We start by assuming rationality. We do not expect new acquaintances to react irrationally to particular topics or eventualities, but when they do we learn to adjust our strategies, just as, with a chess-playing computer, one sets out with a high regard for its rationality and adjusts one's estimate downward wherever performance reveals flaws. The presumption of rationality is so strongly entrenched in our inference habits that when our predictions probe false, we at first cast about for adjustment in the information-possession conditions ... or goal weightings, before questioning the rationality of the system as a whole.

A presumptive rule could be expressed as follows: The speaker wants to aim at a success of rational communication, that is, he avoids initiating distraction from the success of communication by providing

overloading or misleading information. A presumptive rule implies that sentences lead towards a communicative goal. A presumptive rule can be interpreted as a hermeneutic presumptive rule. Scholz (2001[2], 166f.) referred to Ullmann-Margalit (1983). She, and also Ullmann-Margalit and Margalit (1982), had worked on the idea of a presumptive rule as a guide of rational understanding and action more fundamentally. The presumptive rule is neither a rule to make a forecast on the communication action nor a commitment but rather is addressed to the hearer to guide his action, that is, the understanding.

According to central bank communication and language, such a presumptive rule is welcome because the central bank doesn't act for its own benefit. A presumptive rule is not to be interpreted as a commitment towards prospective decisions by the central bank. A presumptive rule steps beyond the ideal construction of principles of cooperation and associated maxims such as conversation principles. To guide expectations in the markets a central bank needs to guide the communicative interactions in order to secure the understanding of its decision-making procedures by the audience.

The presumptive rule is embedded in the history of, for example, a country, its experience, the central bank, and the economic situation. A presumptive rule supports the understanding of what has been said in direct speeches and in all modes of publications. The public presupposes the central bank to be aiming at a rational dialogue with the financial market. The public knows that the interest rate will fluctuate over time. The direct speech at a press conference provides only sentences with limited time horizons. But this is not a failure of language activity or a failure of the everyday language, but rather a key feature of the literal meaning of colloquial language in communicative interactions.

What are the presumptions according to the principles of cooperation, the associated maxims, and the economic context? The participants at the press conference expect the central bank to raise the interest rate immediately. They presume that the chairman uttered a true and relevant sentence, and that he was aiming seriously at the common goal of communicative interaction. It is important to judge beyond the literal meaning of the sentence in order to get an understanding of the sentence as embedded in practice. Without any coherent, relevant, or rational presumption about the circumstances, no understanding of press releases of the central bank, direct speeches, or statements are possible. The understanding refers to the standard of rational dialogue, hermeneutic principles, empirical assumptions about common responses by people regarding different information and circumstances.

Common responses or common reactions imply that people act rationally in order to achieve their goals, and they therefore avoid misleading information or language activities.

In contrast to the view outlined in the previous paragraph, the presumed reliance on a merely mechanical response or reactions or so-called reflexes will not lead to understanding. Only if the economic science still adheres to the naïve behavioural paradigm in economic theory, which has already been abandoned by other social sciences, is it possible to argue by way of such a mechanical response reaction analogy.

The term implicature is proposed as a cooperative principle which introduces the cooperative presumption, determinacy, and mutual knowledge conditions, but Grice left open how the implicature could achieve that rule as a cooperative principle. How should it be possible to achieve mutual knowledge and determinacy by a reference to the term implicature? The term implicature is not oriented towards a coordinative interaction since it only has a semantic role. Grice also stated that conversational implicatures can be worked out or inferred from conversational principles. The generative assumption, stating that the conversational implicatures are generated by and predictable from the satisfaction of those principles is not convincing, since Grice only proposed it as a premise. It is a failure to argue that conversational implicatures can be derived from, and explained by, conversational rules.

The theory of implicature provides a theory of rational dialogue or rational hermeneutics based on the hermeneutic presumptions Grice defined as conversational and conventional implicature. Grice's principle of cooperation and its associated maxims are subordinated parts of the overriding principle of rational dialogue. Davis objected to Grice's theory of implicature: 'In sum, Gricean theory fails because speaker implicature is a matter of intention, sentence implicature is a matter of convention, and neither is calculable from or generated by psychosocial principles. Conversational rules instead codify social goals motivating intentions and sustaining conventions' Davis (1988: 190).

Although I agree with the first part of that critique, the non-acceptability of the speaker's intention regarding communicative interaction, the criticism misses the point. Admittedly Grice did not succeed in stepping beyond the 'matter of intention'. The dominant figure in Grice's approach to communication and understanding still remains the speaker, which I do not find acceptable because it is based on the idea of the conduit metaphor and focused on information as linear transmission (see Chapter 2). However, if we appreciate the attempt to

integrate conventional and conversational implicature into the conversations principle as proposed by Grice – as, for instance, Scholz among other authors has suggested by reference to the function of a presumptive rule – then we could come to a further conclusion which, from my point of view, would be beyond the prepositions of logic ordered regularly in the diagrams of truth-possibilities and of truth-arguments.

I propose interpreting this conclusion as inductive reasoning, also implying the creation of meaning in the communicative interaction and, hence, in the context, which also includes to acknowledging uncertainty about the communicative interaction as a whole because of the use of everyday language. If, on the other hand, we assume that the implicature functions in a logical sense, we then have to presuppose that Grice had configured communicative interactions as a deductive system. My proposed interpretation, as outlined in the previous paragraph, contradicts two other ways of interpretation: The term implicature has been criticized in the literature by those who interpret implicature as deductive reasoning of a formal system by emphasizing that this contradicts the role of language and meaning as rooted in the context, circumstances, and trappings of a particular culture (Keller 1995). However, the term implicature has been accepted by those writers who support the view that communication is based on coded language and a certain types of behaviour.

Although Grice did not define the term implicature, it is possible to argue that it draws a kind of conclusion. Grice argued that since any utterance is incomplete regarding the speaker's intention as the whole, that is, the speaker's utterance provides only a part of the meaning. Therefore the incompleteness of the expression regarding its content leads to the implicature. The content of the communication which goes beyond the utterance itself has to be implied. We are now able to conclude that the theory of implicature restricts the supposed generality of the principles – a conclusion Grice did not make.

I now turn to draw some conclusions on Grice's view. He limited the proposed general rule-based approach to achieving a communicative success by way of his theory of implicature. However, he did not discuss the theory of implicature in its function as a restriction of that supposed generality. Grice discussed the principle of cooperation as a requisite to achieve the success of communication by stating that the speaker's capability of exploiting the mentioned principles and associated maxims will lead to success whereas the hearer will decipher the speaker's intention through the speaker's action. While Grice tried to implement a theory of dialogue, he failed to articulate how a dialogue

could be implemented. The speaker's intention determines the meaning and understanding. The speaker utters what he meant, and the hearer acknowledges what the speaker means by reacting in a certain way.

Although Grice referred to the speaker's intention, he did so not in the way that proponents of the theories of intentionality of meaning do. A particular feature of theories of intentionality is the idea that the intentionality of terms is related to a person. Dennett described it as an 'intentional stance' (1971). The relation to the person is linked with the intentional pattern of acting. The supposed ascribing of the intention to a person also implies certain assumed persuasions, wishes, expectations, and mental states of the person which are interpreted as particular reasons to act (see Brandom 1994). The difference between what the speaker 'means' with words or sentences and what he utters refers to theories of intentional systems (Kemmerling 1986). The demand for the speaker's framework is hardly acceptable for a theory of dialogue (Thomas 1995). It is hardly acceptable to identify the result of a communicative interaction as the speaker's intention transmitted to the hearer. In my view Grice's principles of cooperation and its associated maxims can be reread as principles of commitments.
